sured by the persons in charge of them and they may not be lodged with immoral or drunken people or in unsanitary or overcrowded homes.

I have in this paper endeavbred to give you a short description of some of the work being done in England now to improve the general conditions of public health and particularly in regard to those matters in which women are taking an important part.

Although perhaps in Canada today you have no such serious problems to solve in this connection as Great Britain has, yet with your rapid increase in growth and ever widening development, such questions cannot long continue to be impersonal ones and possibly much may be learned by watching the progress of England, avoiding the mistakes she made in the past and adopting to the use of the new country the things which have proved beneficial to the old.

An address by Miss Mary E. Dykes before the Women's Convention at Charlottetown, during the recent seed fair.

Treatment for Smuts.

There are two common kinds of wheat smuts:—Stinking Smut and Loose Smut. The former has a fetid smell which is very penetrating, and attacks only the kernel of the head, the chaff remaining free. Loose Smut, on the other hand, has no fetid smell but attacks both the kernel and the chaff. As the bluestone and the ordinary hot-water treatments are not effective against Loose Smut, it is very important that the farmers early learn to distinguish the two kinds of wheat smut.

Another smut of great importance is the Loose Smut of Oats.This form can be treated by either the hot water or the Formalin methods as outlined below.

1. Hot water treatment for the Stinking Smut of Wheat and the Loose Smut of Oats.

Things needed:—Two large kettles or barrels, a large coarse sack, 2 pails, a thermometer, and supplies of hot and cold water.

The seed to be treated is put into the coarse sack—half a bushel or more at a time—and for one minute dipped several times into the barrel which contains warm water at about 115 degrees F.; then the sack is lifted out and plunged into the other barrel containing hot water at 132 to 135 degrees F. The sack should be plunged and lifted in this scalding water so as to stir the seed and allow the water to come in contact with every grain. This operation must last for ten or fifteen minutes. It is very essential that the temperature of the water should not fall below 130 degrees nor get higher than 136 degrees. If the temperature is too low, add some boiling water; if too high, add cold water. Great care must be taken to stir the water and to keep it at the proper temperature.

After treatment the grain should at once be spread out in a thin layer on a clean floor, to dry quickly. Shovelling the grain over three or four times will hasten the cooling and drying.

2. Bluestone treatment for the Stinking Smut of Wheat.

Things needed:—Bluestone, water, lime, two barrels, and a coarse sack.

The seed is put into the coarse sack and immersed for 12 hours in the bluestone solution, which is made by dissolving 1 lb. of bluestone in 24 gallons of water. Then the sack is immersed for 5 or 10 minutes in lime water, made by slacking 1 lb. of lime in 10 gallons of water.

The seed is dried by spreading it in

"the finish" "that endures"

M L Floorglaze

gives woodwork a surface glass-hard, mirror-bright, beautiful, lasting. Fine for floors, because M L Floorglaze can't be marred by boot-heels, castors, nor chair-legs. M L Floorglaze stays glossy; you can wash it with soap and water as you'd wash a window; it doesn't fade; it stays new and bright longer than anything else you get. Easy to put on M L Floorglaze—do it yourself—it dries hard overnight. Renovate with M L Floorglaze.

M L FLOOR-GLAZE comes in tins of just the size you want. Seventeen colors in solid enamels. Seven other colors in Lacs that admirably imitate hardwoods; and also a Transparent (natural finish) M L Floorglaze. Coat 500 square feet with a gallon. Just ask your dealer, or drop us a post card for news of a hundred uses your home has for the finish that endures.

Imperial Varnish & Color Co. Ltd., Toronto

Best Doctor on Earth.

Cures all Curable Diseases with Oxygen. Cures when all Others Fail. No Drugs. No Electricity.

The Perfected Oxygenor King will protect the health of the whole family for a life-time, **free** of cost other than its purchase price. **It is superior in all particulars to any other method of treatment. It stands without a rival as a curative agent.**

It is highly indorsed and recommended by hundreds of thousands of people in all walks of life, including **Clergymen, College Professors, Judges, Bankers, Editors, Merchants, Lawyers, Farmers, Railroad Men and Physicians.** It is designed for self-treatment and can be used by anyone. The **Press**, the **Courts** and the **Pulpit** unite in indorsing this, the most rational, safe, pleasant and effective treatment known, and which is designed to supercede the unsafe, uncertain and unpleasant methods still generally in vogue.

We will gladly furnish you with descriptive literature and names of grateful people throughout the Maritime Provinces and Canada, who have used the treatment.

If you value your health, and the health of your family, you will investigate our treatment at once.

Remember that procrastination is the thief of life as well as the thief of time.

a thin layer on a clean floor, and by shovelling it over three or four times till dry.

This treatment is not recommended for oat smut.

Stinking Smut of Wheat and the

3. Formalin treatment for the Loose Smut of Oats.

Things needed:—1 lb. bottle of Formalin, water, a barrel, and a coarse sack.

The 1 lb. of Formalin is dissolved in 40 or 50 gallons of water, and the sack of seed is immersed in the solution for about 20 minutes. Then the seed is spread out on a clean floor to dry.

4. Cold and Hot-water treatment for the Loose Smut of Wheat.

Things needed:—A barrel of cold water, a barrel of hot water, a large coarse sack, a thermometer, and a pail.

The seed is soaked for four hours in cold water, then allowed to remain four hours longer in the wet sack. It is then immersed for five minutes in hot water at 132-135 degrees, after which it is spread out immediately to dry. As some of the grains may be killed by this treatment, which is the only one recommended, for the Loose Smut of Wheat, additional seed should be sown per acre.

Recommended by W. Lochhead, Professor of Biology, Ontario Agricultural College.

The Value of Cow Testing.

Circular letter to Milk Testers, and Cheese and Buttermakers.

Dear Sir,—At the beginning of another season of milk production, it is desired to remind you of the great importance of getting your patrons to take up cow testing.

It is quite expected that all the old members of associations will continue, but there are probably very many more who would take it up if you recommended the plan to them as strongly as you possibly can.

With the commencement of cow testing comes more milk per cow, which is a great gain to the patron, for some men are now receiving twice as much income per cow as they were four years ago. There comes, also, the opportunity for you to make a substantial addition to your income every month through doing the testing as this Department pays five cents for every test and supplies the acid.

The probable gain to the factory is very important. More milk from the same territory means lower cost both of hauling and making, besides a longer factory season. Then as members become better dairymen there is improvement in the care of the milk which means easier work in the factory and a better product.

Will you, therefore, do your very best in assisting to extend the cow testing movement?

As soon as you have seen your patrons, please write what the prospects are, when this Department will be glad to help you in every way possible. CHAS. F. WHITLEY,
In charge of Dairy Records.
J. A. RUDDICK, Commissioner.

Pointers for the Amateur Gardener.

Editor Maritime Farmer:

The following are a few condensed pointers that either the home gardener or the market gardener should dener should follow in order to be a successful grower:

1. Soil should be a sandy loam well drained.

2. Plowing.—Fine the soil by deep, thorough cultivation, wuntil no lumps of either soil or manure are left anywhere above the lowest depth of the plowing, and until the manure and soil are well mixed.

3. Fertilizing.— Get well rotted manure if possible. Broadcast all you can get to a depth of not more than three inches. Turn it in as soon as you can, so as not to lose any more ammonia than you can help. Save all the liquid manure, bones and woodashes in some out of the way place where their odor will not be objectionable. Use stable manure in preference to commercial fertilizers, if practicable, because it improves the texture of the soil.

4. Planting.—Use a line. Plant in perfectly straight lines to make easier weeding and cultivating with wheel hoes.

5. Distance. If you have plenty of room and a horse, make the rows at least two and one-half or three feet apart and for the larger plants not less than four feet.

6. Planning. When planning try to put together those crops that ripen at the same time, so as to clear up and use blocks of land together at the same time; but in doing this do not sacrifice the more important benefits derived from rotation of the crops.

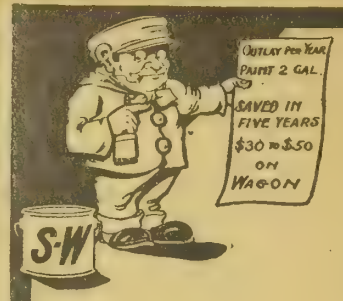
7. Rotation.—Try and not plant the same or similar crops on the same ground more than one year in uccession.

8. Rolling.—After planting your seed, tramp or roll the ground just over the seed, except in a very wet season or on wet ground. This brings the moisture from below up to the seeds and helps them sprout. A little loose soil scattered over what you have rolled helps keep in the moisture. If, however, growth is delayed by bad weather, do not let the surface become caked, but scratch it so as not to disturb the sprouts and when the plants are through, cultivate and stir lightly all around them.

9. Cultivating.—Never work the soil while it is wet, as that makes it lumpy and hard; but as soon after every rain as the ground can be worked without sticking together in lumps, hoe or cultivate the entire surface of the garden so as to leave about an inch of loose soil over the surface. This will act as a mulch and conserve the moisture, which your plants will utilize. Do not let the soil become "baked." Do not tramp over and harden the soil of your garden any more than possible.

10. Disease.—Pick and burn at once all leaves or vegetables showing signs of rot or disease.

11. Weeds.—Kill weeds by wholesale methods when they are small.



"Time works great changes"

But there are some changes you can prevent. If you want to make money and at the same time save money, you should look after the wooden things around the farm. Paint should be your best friend. For instance, is the woodwork of your wagon warped and checked? You know what it means if it is—the life of the neglected wagon is not much more than 6 years, when it should be 18 to 20 years. You ask, "How can this be done?" By getting out your paint pail and painting your wagon twice a year. It will require about 2 gallons of paint and about 4 hours of your time. In 5 years' time you will save between $30 and $50 on your wagon. This is also true of your plows, rakes, and other wooden implements.

The Little Paint Man.

SHERWIN-WILLIAMS PAINTS & VARNISHES

Sherwin-Williams Paint, Prepared (SWP) is made from pure white lead, pure zinc, pure linseed oil, and the necessary coloring pigments and driers.

Sherwin - Williams Varnishes are made from the best gums, pure linseed oil, pure turpentine, and are thoroughly aged.

THE SHERWIN-WILLIAMS CO.
1078
PAINT AND VARNISH MAKERS
MONTREAL TORONTO WINNIPEG VANCOUVER

12. Picking.—Pick all defective or ripe fruits; if left to go to seed they will stop production.

13. Watering.—Do not sprinkle too frequently and avoid water that is too cold. Let it warm somewhat and run it in furrows over the ground, so that it will soak in deep. Do this once a week or when the ground has become somewhat dry. After watering cultivate as soon as the soil is dry enough for that purpose.

14. Succession.—A judicious mixture of early and late varieties will produce a succession and prolong the yielding season, but a better way is to combine with different maturing varieties the principle of making several successive plantings of the choicest varieties. If you are compelled to plant late in the season, then use the early, quick maturing varieties of seed, so that they will not be cut off by frosts.

15. Transplanting. — Only transplant your healthy plants. Have your soil freshly cultivated and in good tilth with a fair amount of moisture. See that the earth is made firm around the plant and leave the surface hollow around the plant. Set it a little deeper than it had been in the cold-frame or hot-bed. Begin cultivation at once after setting out. Give plants a good watering before setting out. If leaves are well grown cut part of them off so as to equalize the loss in root system.

Richmond Co., N. S.

Words of Cheer for V. P.

Editor Maritime Farmer:

I read with interest V. P's. letter re Report of Poultry Department, Ottawa Experimental Farm and with him I must admit that one looking in that direction for the encouragement in the production of winter eggs would in truth get what he aptly terms a cold douche. An average per hen of 2.5 per month is to say the least remarkably small and unprofitable, unless perchance they be golden eggs. I have before me the Report of the Alberta Experimental Poultry Dept., and this Department can surely boast of having done equally as well as the older and more pretentious Department at Ottawa. Average per hen during the month of January, 1.22; during February, 2.32 and during March, 5.63. A nother cold douche surely. With the means, the time and the knowledge these Departments have at their disposal one need not be over sanguine to expect better results.

However, I would humbly advise V. P. not to be disheartened as there are hundreds of poultrymen and farmers in these Provinces, who with some attention to feeding and housing have succeeded fairly well in the production of eggs during the winter months. The writer, during the winter of 1910, for the months of January, February and March with 40 hens got an average per hen of 15 eggs per month. During the present winter of 1911 with 45 hens, 30 of which are pullets, the average per hen for each month has been 13.2. These are fairly good results, but I have no hesitation in saying that even better results could be obtained and no doubt many are doing better.

Hoping that others of your readers will give V. P. figures that will make him forget forever the chills of the cold douche.

P. C. GAUTHIER.
P. E. I.

Eradicating Cough Grass.

Editor Maritime Farmer'

Some time ago you asked me to describe the practice or method of cultivation I follow to eradicate Couch. Well, on the home farm, we have not very much at the present time but on a rented farm there are a few bad patches. We treat it about as follows:—Break the sod in September and harrow twice. After two weeks harrow again and so on. Allowing two weeks or more, according as it is convenient to get back at it. The third or later cultivation with a spring-tooth cultivator and smoothed with a spike harrow as this is the best to break up the lumps. This method will keep all kinds of weeds as well as the couch from putting forth any green leaves, the surest way to sap their vitality. Last thing in the fall rib the field up. No matter how rough it is the frost will work while we cannot. In the spring when dry, if intended for grain cultivate to break the crust. Go to another field for a day or two and then it will be found the couch has about disappeared.

If roots are to follow, cultivate from time to time as there is opportunity to get an hour or to at it. In this way we never failed to get a good seed bed for any kind of crop. —W. H. McGREGOR, Prince Co., P. E. I.

I find no trouble in keeping down Couch grass by following a proper system of rotation on well maured fields.—KENNETH McLEAN, Pictou Co., N. S.

I have prevented the spread of Couch grass on my farm by clean cultivation and the subsequent destroying of its roots.—F. SCOTT.

We do not believe in hauling Couch Grass roots off our fields as we thus cart away a lot of fertility. We prefer to cultivate the soil thoroughly and often when the weather is very dry.—SAMUEL CREELMAN, Colchester Co., N. S.

Yes, I have Couch Grass on my farm. I have been successful in getting rid of some of it by thorough cultivation and a hoed crop for two years in succession, using a very liberal quantity of manure to give the turnips which I invariably use as the second year crop a quick start. Sow the turnips in rows, two and one-half feet apart and as the leaves develop they smother the Couch. It takes a lot of patience and perseverance to eradicate it.—R. C. FORD Queens Co., N. S.

As my farm is quite old it has become thoroughly infested with Couch. On land we prepare for roots, we plow in the fall after the crop has been taken off and then cross plow in the spring. Then we put three horses on a large spring-tooth harrow. We set the teeth deep and harrow four or five times in a place. We leave it for a few days then go over it again in the same way. Then we take the hay rake and rake all the roots up in rows and cart them off. By preparing the land in this way way we have good results in checking the growth so we do not see any grass that year. On land we crop with grain and seed down we only give it a good harrowing. The Couch does not affect the crop any and we think the Couch makes good hay if cut in the right time, that is, early before it begins to turn. We always top-dress our grain crops, harrowing the manure in with the grain and seed.—A. W. DOBSON, Westmorland Co., N. B.

We have Couch Grass on our farm and have not been very successful in getting rid of it as yet. We have found that by plowing as early as possible in the fall and after drying for a few days we give it a thorough harrowing with a spring-tooth harrow. We haul all loose roots off the field. As soon as land is fit in the spring we give a succession of harrowings whenever time permits, until after the twentieth of June when we sow buckwheat for a crop after harrowing in carefully we again haul all loose roots off. We find the spring-tooth harrow better than the disc, as the latter cuts the Couch roots up making it harder to gather off the land.—J. W. FOSHAY, Queens Co., N. B.

I have been bothered with Couch Grass and to get rid of it first, I plow the ground in the fall and in the spring I harrow it thoroughly with a Frost & Wood disc harrow. I then rake it thoroughly with a horse rake. By this means I have got rid of it. Sometimes I use a hand rake to gather it clean.

I get a great deal of good out of the Maritime Farmer. As I am a blacksmith it helps me out in that line as well as in farming.—JACOB MOONEY, Cumberland Co., N. S.

The best way I find to rid a field of Couch is by shallow plowing in hot weather. Thorough harrowing after plowing will drag out many of the fleshy root stocks, which will soon dry up in the sun and then they may be burned.

In fields that are badly infested, the land should be plowed late in the autumn and well cultivated to expose the root-stocks to the action of the frost. In the spring the ground should be plowed again, and stir it frequent enough to prevent new growth till midsummer, then sow a smothering crop such as vetch or buckwheat which will choke out the weakened plants.—J. A. McDONALD, Kings Co., N. S.

My farm is not over-run with Couch, but in some spots it is pretty bad. In giving you my experience and observation I do not claim to know it all and I shall watch with interest the various letters that may appear in the Farmer on this subject. When our grain crop is cut off land on which we wish to grow roots or vegetables the following year and we notice much Couch Grass we turn down the stubble at once. If the field is such a shape as to permit we cross-plow. A day or so after we finish plowing or just as soon as the ground gets well dried, we harrow well with a spring-tooth harrow and repeat every week as long as the ground remains dry. This brings a great many roots to the surface of the ground, and if the fall is anyways dry the action of the sun and frosts in winter causes them to die, so they will not grow the following year. One of my neighbors informs me that he has been successful in exterminating it from one of his fields by taking three crops of buckwheat in succession. He applied about 600 to 700 lbs. of Basic Slag to each crop. A few years ago, I had a field that was very badly infested with Couch Grass; the ground when plowed was simply a mass of turf. I pastured my cows on it for three years. By this time it had become almost bald and now, after some years of cultivation it is almost exterminated. My land is rather dry, some gravelly and some sandy loam.—INTERESTED FARMER, Col. Co., N. S.

A FLOOD OF LIGHT FROM KEROSENE COAL OIL

THE ALADDIN MANTLE LAMP generates, with Coal oil (Kerosene), a light far more brilliant than gas or electricity. It is simple, durable, portable, odorless and safe. Satisfaction guaranteed.

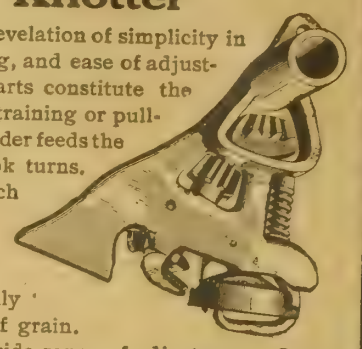
AGENTS MAKE BIG MONEY

by showing the lamp, the light makes the sale. It revolutionizes rural lighting; needed in every home. The SUNBEAM burners fit all ordinary lamps. Ask for Agency proposition or how you can obtain a lamp FREE to introduce it.

The MANTLE LAMP CO. of America, Chicago. Winnipeg and Dept. H MONTREAL.

McCORMICK

A Simple Knotter



THE McCormick knotter is a revelation of simplicity in construction, accuracy in tying, and ease of adjustment. Only two moving parts constitute the working mechanism. There is no straining or pulling of the twine because the twine holder feeds the twine in the direction the knotter hook turns.

The cutter bar has guards in such a position that the machine can be tilted to cut close to the ground without pushing trash and stones ahead of the knife. It cuts smoothly and perfectly in all conditions of grain.

The McCormick reel has a wide range of adjustment. It successfully meets the conditions encountered in any field, whether the grain is tall or short, standing, down, or tangled. Grain filled with green undergrowth is forced upon the platform.

The McCormick floating elevator handles grain of any length or weight without clogging, even when the grain is filled with vines or green undergrowth.

There are many other features and advantages of McCormick binders. The McCormick agent will tell you about them. He will tell you about the wonderful strength of each individual part and of the strength of the binder as a whole—of the skilled workmanship backed by many years of experience that enters into the construction of every McCormick binder. Why not see him today? Ask him about McCormick haying machines and tools.

PORT WILLIAMS, . Nova Scotia.

The Kingdom of Alfalfa.

(Continued from page 437.)

A NURSE CROP NOT A NECESSITY.

In their earlier experiences farmers believed it advisable to sow in the spring, and with some sort of a nurse crop. Now a majority incline to fall sowing— say about September 1— and a nurse crop is not rated as an advantage. The claim that a nurse crop will prevent weeds from choking the young alfalfa is apparently, as a rule, not well founded. In the first place alfalfa should not be sown on foul land, and in the second place proper disking and harrowing, at near intervals for four or six weeks before sowing, will destroy far more weeds than any nurse crop. Besides, the oats, barley, or other crop sown as a nurse will when cut, leave weeds ready to spring up as fast or faster than the alfalfa. No nurse crop is ever used with fall sowing. When ground has been thoroughly prepared for the preceding crop, then properly cared for and made ready for alfalfa by the preliminary weed destruction, it is advisable to sow alfalfa alone, even in the spring.

CULTIVATING CONDUCIVE TO THRIFT.

Cultivation is an essential to alfalfa in maintaining the stand and increasing the yield as it is to other crops. In the hands of an intelligent farmer the ordinary harrow and the disc harrow are t he crop's best friends. The tooth harrow should be used in the earlier stages of growth. The disc harrow should not be used until the plants are well toward a year old, and then with judgment and care. One extensive grower had the following experience: A field in the second year of its growth was given a thorough discing one way and then cross-harrowed. When this was completed the field had the appearance of a well-prepared seedbed, no alfalfa being visible. This was early in the spring, just after the frost was out of the ground and the soil in condition for cultivation. It was an experiment at the time, but the results proved its correctness. The alfalfa grew and thrived, and where there had been but one stalk many others appeared. The explanation is simple. The disking split the crowns of the plant into numerous sections and on each of these new stalks appeared, whereby the yield and the fineness were increased. Disking proves beneficial after each cutting, as it not only destroys the weeds but the webworm and larvae of other injurious insects.

ALFALFA A GREAT SOILING FOOD.

One of the most profitable ways of using alfalfa, particularly in dairying, generally overlooked even by those who have the largest acquaintance with it, is for soiling purposes. Some of the wise ones do not hesitate to claim that twenty per cent. of alfalfa's digestive value is conserved as feeding it green instead of as cured hay from the stack, when the ordinary deterioration, the waste of hay and the loss of leaves are taken into account, and that there is something af the same ratio of saving by feeding it green instead of pasturing it, considering the losses incident to trampling and the coarser portions being left uneaten because of their less palatibility. For soiling it can be cut just when it contains the highest per cent of protein, while if grazed some of it is used before it is in its best stage of development, and much of it afterwards, at a time so late that the stems have become too woody and the leaves, the most valuable part, have partly dropped off.

In an experiment at the Nebraska Station it was found that it required 3.63 acres for a cow kept on alfalfa pasture, while .71 of an acre kept a cow if the alfalfa was cut and fed to her when green. The pastured cows gave the most milk but the cost to produce it was greater. From another test for a single year it was decided that about twice as much feed was realized from the land when the product was used for soiling instead of for pasturage. The average daily production of milk and butter fat was, however, markedly greater when the cows were pastured. The Kansas station, in an experiment continuing 144 days found that pastured cows returned an income, excluding the cost of grain fed of $4.23 a head, while those soiled gave a return, less cost of grain, amounting to $18.08 each.

On a big dairy farm near Denver, soiling with green wilted alfalfa has been the practice for twenty-five years, and the owners will not listen favorably to a suggestion that any other method of utilizing their alfalfa be as profitable.

The Bread and Butter Age,

The growing child needs more good food at frequent intervals than the adult. Nothing is better and safer between meals than a slice of the good home-made bread. Formerly graham or whole wheat bread was favored; but Dr. Woods Hutchinson, the prominent hygienic writer, and other experts, have pointed out that the coarser flours are really less easily assimilated and are inferior in food value to the best white flour.

"Beaver" Flour

is a product uniting the merits of the coarser flours with the delicate, white, appetizing qualities appreciated by children and grown people alike. It is not a crude mixture, but an exactly proportioned scientific blend of Manitoba Spring Wheat and Ontario Fall Wheat. The famous Manitoba No. 1 Hard contains the gluten and proteids which build bone and sinew, and we balance this with the right proportion of the best Ontario wheat, softer, whiter and richer in carbohydrates, to make a perfect food. For bread, cake and pastry, use BEAVER FLOUR.

Fanning Mill SeIrction of Seed Grain.

Editor Maritime Farmer:

As I am only a beginner in seed selection, as practised under the direction of the C. S. G. A., I will in as few words as possible describe the marked improvement derived by selecting seed grain with the fanning mill, confining myself to oats. In 1907 I received from a seed house a quantity of oats said to be Banner, of a very inferior quality. As the season was well advanced and the field ready, I did not wait to reclean it. There were a great many short heads on a short stand of straw mixed in with the taller straw.

The following year, 1908, when oats were selling for 53 cents per bushel, I cleaned ninety-eight (98) bushels down to sixty-eight. In 1909, with a larger quantity to select from I graded it somewhat heavier. The improvement was very marked, each year by a very much better head, and a more uniform length of straw. In 1910, when a sample was entered in the general competition at the Provincial Seed Fair at Summerside, on account of the plumpness of the grain, the judges set it aside as not of the Banner type, although when the crop was judged the type was not disputed. This year it is more of the Banner type, having grown and a much heavier straw, due to the different condition of soil and was a splendid crop. Four and one-half tons straw yielded three hundred and thirty-one (331) bushels clean oats, nearly seventy-four (74) busheld to the ton. I am convinced that had I started with a sample of registered seed the results would have been better all along.—W. H. McGREGOR, P. E. I.

Your tongue is coated.
Your breath is foul.
Headaches come and go.

These symptoms show that your stomach is the trouble. To remove the cause is the first thing, and Chamberlain's Stomach and Liver Tablets will do that. Easy to take and most effective. Sold by all dealers.

The Reason Why.

Editor Maritime Farmer:

In reply to your letter of a recent date re advertising in the Maritime Farmer, I would say that I do not think we ever were regular advertisers, for the simple reason that we had nothing of good enough quality or breeding that would warrant making it worth while to advertise.

I am told, my father, when a young man, started in to breed pure bred Shorthorns and Clydesdales but he has imformed me dozens of times that he soon got sick of the pure bred stock business.

Well, I think the present day conditions are all togetner different from what they were then, in more ways than one, for the farmers of the Dominion. I suppose I am like hundreds of other sons. My father and I cannot see matters in the same light in regard to stock raising. I always liked good live stock and I believe I always will. If the time ever comes when I cannot have a few good stock cows and a good sensible type of brood mare, my days on the farm will be numbered. I believe that the lack of encouragement in live stock breeding drives many of our young men away from the farm. The boys want a pure bred cow or two, a good brood mare, a pure bred sow, a few well bred fowls and likely a respectable driving horse and buggy. If the father turns down his ideas by saying "I tried all these things when I was young and found there were more dollars in raising scrubs the young man's ardor for improved farming methods and live stock is dampened.

As far as the dollars part is concerned, our fathers may be right but I believe at the same time, that the older men have spent too much thought on the dollar part of farming to the deteriment of their sons and daughters.

I don't want you to infer that I think fathers are wrong in every case for I think, in a good many ways they can still tell the young men a great deal about farming; but, on the other hand, some young men can tell their fathers some things to their advantage if they would admit it. They may see the point but they are unwilling to admit that the young men know more than they do. You will pardon me for referring to the following personal incident: I had heard my father say that he would buy a sow if he could procure one, with pig, that would not be too expensive. I wrote to Professor Cumming, Truro, N. S., to know if they had any purebred Yorkshires for sale. He replied that they had a beautiful sow, one year old in April, due to farrow in June, that he would sell for $25.00. I told father about tnis sow and his reply was that he guessed we did not need her, the price was too high and several other objections.

It was nearing the Easter holidays and as I had an invitation to Truro, went there, saw the sow and also took a fancy to a Shorthorn bull that I saw there. When I returned home I asked father what he thought about buying the stock referred to. He still did not see any sense in my reasoning in regard to getting pure bred stock. However, I wanted the sow, so I wrote to Prof. Cumming and bought her with what little cash I had and after a few days a friend of mine and myself bought the bull.

In due time the sow farrowed fifteen beautiful pigs and raised fourteen of them. I sold twelve of them when they were four weeks old for $48.00. I gave one away and kept the other myself. On the third of this month the sow again farrowed fifteen pigs and is raising fourteen of them. Was not the $25.00 spent for this sow a good investment? Well, father has never said a word in favor of me buying that sow, nor anything against her because he could not. We were unlucky with the bull in the way of not getting many calves. Father never forgets to give me an occasional dig about that bull. However, I guess I can stand it, "Live and learn". I would appreciate it a little more if said a little less about the bull and say a few good words for the sow transaction.

I was just reading an artirle on the "Dual Purpose Shorthorn" in the last issue of the Maritime Farmer. The writer said it was poor policy to try to breed for that purpose. He also says "every man has his own ideas." I believe he has. I think one of the troubles with a great many of our farmers is that they never write to the Maritime Farmer or other good agricultural papers and give them a bit of his mind regarding subjects of important interest to themselves and their fellow farmers.

In regard to the "Dual Purpose Cow" I would say that in localities where hay and pasturage is plentiful the farmers should raise the kind of cattle that will make good beef, when fattened, and produce enough milk to raise one or two good skim-milk calves and perhaps a pig or two. At the end of the year these farmers will have a nice growthy pair of calves besides quite a number of pounds of butter or cheese. I believe the best and most profitable cow for this class of farms is the milking Shorthorn.

The extreme beef type is all right for the West where they allow the calves to run with the cows. My uncle has a herd of nine grade cows, mostly Ayrshires crossed with a purebred Shorthorn bull, and they certainly are a credit to any farm. He also has a pure bred Shorthorn cow of milking strain that can hold her own with the best of the grades, so I say et us give the Dual Purpose Shorthorn a square deal.

I have two pure bred Shorthorn cows, which are extra good types of the beef animal, but they are giving a very respectable flow of milk considering that they are not fed particularly for milk production.

How would it do to ask, through the columns of your paper, for the different people, who send milk reords to also give the different kinds of feed they have fed the cows and in what quantities.

Large flows of milk are all right ut what about the cost, of them compared with the cow that gives an average flow. In nine cases out of ten the average cow does not get the feed nor one quarter of the care that some of the high record cows get. We cannot give our cows the attention they should receive in order to give big flows of milk.

I have seen quite a lot, in the beef nd dairy classes, at the Maritime Winter Fair, during the last four years. I have seen a good many cases that are all right and some that are very wrong for the average farmer. Of course, nothing is perfect.

When we get enough good, average Dual Purpose Shorthorn cows to have stock to sell, I will then advertise in your paper. I am going into the Dual Purpose business slowly and will ultimately see what can be done at it for combined beef and milk production.

Editor's Note.—The above article was written with the request that the writer's name be withheld. We know him personally, to be a bright, industrious, intelligent young man, that is sure to make things go with a vim.

You Can Get This Gramaphone on

FREE TRIAL

We will send to any responsible person this Victor Gramophone and twelve selections for an absolutely free trial. We do not ask any money down or in advance. There are no C. O. D. shipments, no papers of any sort to sign. Absolutely nothing but a plain out-and-out offer to ship this Gramophone and the selections mentioned on a free trial so that you can hear it and play it in your own home. There is no catch about it anywhere. If you stop and think a moment you will realize the high standing of this firm would prohibit anything except a straight, forward offer.

ALL YOU NEED DO

All we ask you to do is to invite as many as possible of your friends to hear the wonderful Victor Gramophone. We feel certain that out of the number of your friends who will hear your machine there will be at least one and probably more who will want a Victor of their own. If they do not, if not a single one of them orders a Gramophone, we will not blame you in the slightest.

IF YOU WANT TO KEEP

If you wish to make the Gramophone your own, you may do so, but it is not compulsory. This is a free trial. You may send it back at our expense if you wish. We won't be surprised, however, if you wish to keep the machine after having it in your own home. If you wish to keep it, either remit us the price in full, or if you prefer, we will allow you to pay for it on the easiest kind of payments.

OUR EASY PAYMENT PLAN

There are so many people who really want a Gramophone, but who do not have the ready cash to pay for it all at once, that we have decided on an easy payment plan that gives you absolute use of the Gramophone while making small weekly or monthly payments. Just sign your name and address on the coupon now, and mail it to us to-day.

J. A. McDonald Piano & Music Co.,

Was Troubled With Liver Complaint For Three Years.

Milburn's Laxa-Liver Pills will regulate the flow of bile to act properly upon the bowels, and will tone, renovate and purify the liver, removing every result of liver trouble from the temporary but disagreeable headache to the severest forms of liver complaint.

Mr. S. Nelson, North Sydney, N.S., writes:—"I have used your Laxa-Liver Pills. I was troubled with liver complaint for three years, and could get no relief. I was persuaded by a friend to try your remedy, and after taking one vial I got relief. After I had taken three more I was cured completely, and I have not been troubled since, thanks to your valuable medicine."

Milburn's Laxa-Liver Pills are 25 cents per vial, or 5 vials for $1.00, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Constipation is the root of many forms of sickness and of an endless amount of human misery.

Dr. Morse's Indian Root Pills,

thoroughly tested by over fifty years of use, have been proved a safe and certain cure for constipation and all kindred troubles. Try them.

The Sheep Raising Industry.

Wool for clothing, mutton for food and fertility for the soil are the permanently profitable virtues of the sheep husbandry. How then does this apply to the Maritime Provinces? I should say, "admirably." Think for a minute. First, clothing, ehen food and last, but by no means least, fertility of the soil from which we derive our bread. What more then is needed? Sheep are probably capable of larger nett returns to the owners than any other class of stock. It is a great pleasure to the writer, to publicly advocate anthing which is growing fast in popularity and try to help stay the discarding of sheep, which I understand has been going on for some time in the Maritime Provinces.

In all operations there are two important considerations, the cost and the profit. One may farm on a large scale and then spend in operation of it all or nearly all the income. Then when taking into consideration the worry with farm help and the poor quality of some of it, it would be very hard indeed to find much of a balance upon the right side of the sheet. Therefore, it is that I maintain the sheep rearing industry meets this trouble as no other branch of Agriculture can do. The labor required for looking after sheep is a great deal less than that required for other stock. In caring for one hundred head of sheep through the winter the time would be a great deal less than two men need in looking after a herd of twenty-five cattle and eight horses. In summer the labor saving is still much greater for fenced fields with salt and water in daytime and a dog proof enclosure for nights will make the work a mere trifle. But very little experience is needed to fully convince us that of all four-footed animals sheep have a long lead in economy of labor in proportion to the possible profits.

For the past few years there has been great activity in the American sheep markets. The increase in the value of wool has lead up to a great boom in sheep raising. In Canada the fever is being felt and it is surprising to know of the great interest that is being taken by the average farmer throughout the Provinces and especially so in our own Maritime Provinces, where the possibilities of sheep rearing could not be bettered much, may I say, in America.

Enquiries are becoming more frequent for pure bred breeding stock. May I say the golden opportunity is at hand. Do not hesitate and wait, then dip in when the time for making the best of it is past and gone.

While the sheep industry is certain to be a rapidly growing one in the Maritime Provinces, it is to the early or now flock owner the cream of the business will go. Those that desire to secure the largest profits with the least expenditure of labor and feed, will at once, if they have not yet got one, invest in a flock which is capable of producing the kind of lambs which are in the greatest demand in the leading markets.

The Safest Fence to Buy

Safe because it will stand shocks and ill usage.
Safe because it is a complete barrier against all kinds of stock.
Safe because its tough, springy steel wire will give real service.

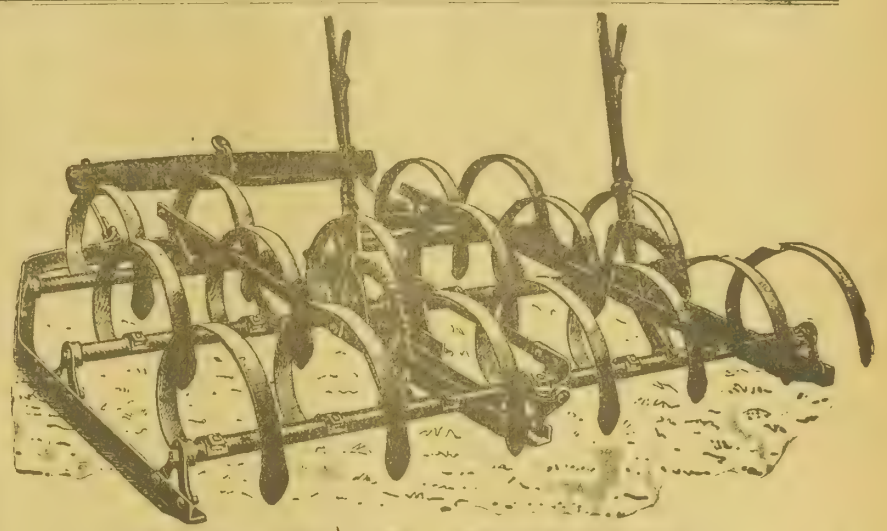
PEERLESS The Fence that Saves Expense

is built of No. 9 galvanized wire of guaranteed quality. To this best of wire add the Peerless method of construction and Peerless lock and you have a fence without a rival.

We've built Peerless fence twice as good and twice as strong as is necessary under ordinary circumstances so that neither accidents nor extraordinary wear can affect it. It saves you money because it is long lived and never requires repairs. We know there is no fence made that will give you more lasting satisfaction. Write for particulars.

We also make poultry and ornamental fencing and gates—all of it of a quality that our customers appreciate and we are proud of.
Agents wanted in all unoccupied territory.

THE BANWELL HOXIE WIRE FENCE COMPANY, Limited,
Dept. K, Winnipeg, Man. Hamilton, Ont.



HARROWS.

The above cut shows a harrow which has proven itself absolutely to be the best working Spring Tooth Harrow on the market to-day. It is built of the highest grade material throughout. It will hold steadier to its work and do more effective work and deeper when desired than any other. With the levers the depth can be regulated instantly while in work, thus easing the draft on the team at first and getting deeper cultivation without increasing the draft at the final scrape.

Every farmer who needs a harrow will look after his own interest well by buying a Bailey-Underwood Lever.

Made in sizes 9 and 11 Tooth, Single Section. 15 and 17 Tooth, Double Section.

Bailey-Underwood CO., Limited, New Glasgow, N.S.

Standard Wire Fence

In the "Standard" Wire Fence, you get the durability that comes with strength. Made of all No. 9 Hard Steel Wire, well galvanized—which means no rust and long wear.

"The Tie That Binds" hooks on the running wire and locks smooth on both sides.

Then—there's the Standard Steel Fence Posts that hold the wires without staples—won't rot and are very durable.

We make a specialty of Galvanized Gates, too.

Our new books are chock full of fence facts. Write for free copies and sample lock.

Formula for Government Whitewash.

Take half a bushel of unslacked lime; slack it with boiling water and cover during the process to keep in the steam; strain the liquid through a fine sieve or strainer; add a peck of salt previously well dissolved in warm water, 3 pounds of ground rice boiled to a thin paste, and stir in boiling hot one-half pound of powered Spanish whiting and one pound of glue which has been previously dissolved over a slow fire, and add 5 gallons hot water to the mixture, stir well and let it stand for a few days, covered up from the dirt. It should be put on hot. One pint of the mixture will cover a square yard, properly applied. Small brushes are best. There is nothing that can compare with it for outside or inside work, and it retains its brilliancy for years. Coloring matter may be put in and made of any shade, as Spanish brown, yellow ochre, or common clay.

An Incubator Free.

The Maritime Farmer believes there should be an incubator on every farm. It means chickens for eating, more eggs and a money maker. To help encourage this we are going to give an incubator absolutely free to the person making the best hatch.

Here are the only conditions. You must buy the incubator this season of some advertiser in The Maritime Farmer. Keep a careful record of the hatch which you can acknowledge before a notary, if necessary, write us before May 30th, giving the number of eggs started with, the number of chicks hatched, and to the person making the largest per cent. of hatch we will refund every dollar they paid on their incubator. This is simple and easy. Remember, the incubator must be bought this season of an advertiser in The Maritime Farmer. When writing to a firm mention The Maritime Farmer. Take this copy and write every incubator advertiser in it or at least send for catalogue so as to get all the information possible, pick out your machine, get it and then be careful with your hatch. If you make best hatch we will refund you every dollar you paid for the machine.

It does not matter whether you start 50, 100 or 200 or any number of eggs. Test at the end of the 10th day, taking out infertile eggs, keeping a record of those so taken out. Then keep a record of eggs hatched from the rest.

Don't fail to take advantage of this. You want an incubator anyway, and by buying it of our advertisers you stand every chance in the world of getting your money all back. We positively guarantee every advertiser in our columns to do as they agree. Write us if you intend to compete and be sure to get your record of hatch by May 30th. You can make two or three hatches by that time. Address all letters in regard to this to Poultry Department, The Maritime Farmer, Sussex, N. B.

The Right Way.

I noticed in one of the last magazines where some one tells how to wash milk pails. It just says to scald them. Now I say, there should be no hot water come in contact with any can, pail or milk dish of any kind until it has first been rinsed clean of all milk left in it. But it must be rinsed clean of this milk first with cold, clear water, then washed thoroughly in good clean soapsuds, then it must be scalded, wiped dry and left right side up where sunshine can get inside; then

ALFALFA SEED . . FREE

WE want farmers in the Maritime Provinces to become better acquainted with us and our seeds. We use the utmost care in selecting our seeds, but unless you give them a trial you will probably never know what you are missing in not getting them direct from us. With a view to our getting in touch with each other—to both our mutual advantage—we are going to offer, for a limited time, a one-half pound package of Alfalfa Seed absolutely free—one package only in a family—to each and every farmer who sends for our seed catalogue. Sending for catalogue does not in any way bind you to buy from us. Write to-day and get one-half pound Alfalfa seed free.

Geo. Keith & Sons,

124 King St., E. Toronto, Ont.

Established 1866.

This offer is not binding unless you mention the Maritime Farmer when writing.

it will be sweet and clean.

I have seen milk pails with strainers in where the fine wire strainer would be filled up with milk, left on there from time to time until no milk would go through; also around the edge where the solder was, milk would collect until it would be as hard as beeswax along the seams in pails and pans and in milk cans. This condition need not be at all. If people would only keep a little common salt nearby and put some on the wash cloth and rub the strainer seams and all rough places in milk dishes of all kinds, there would be no place for germs to lodge.

Here is another point; if one wants to be particular have a pail of warm water and a sponge, and wash each cow's udder and teats before milking, and tie her tail to her leg, then she will not flip dirt into the pail.—Mrs. H. C. Heighton in Successful Farming.

Lime Sulphur Mixture for Oyster Shell Bark Louse.

During the dormant season, says Rural New Yorker, there are always eggs under scales of the Oyster-shell louse laid by the adult and covered by her, and they remain eggs until the hatching season during late Spring, when they crawl forth, mature, lay eggs and cover them. No contact insecticide is as effective against the egg as against the insect. For this reason one application of lime-sulphur is not always sufficient to eradicate Oyster-shell bark louse, be it ever so thorough. But where regular sprayings with lime-sulphur are made the Oyster-shell louse disappears entirely in two or three years. And the lime-sulphur is easier to use, and much more practical than any of the soap or emulsion sprays used or recommended for a summer spray, which are unreliable and dangerous at best, because of the poor quality of many soaps, and of the generally poor emulsion made by those who have not had some experience in preparation.

Raising Orphan Lambs.

Orphan lambs are difficult to raise. One ought if possible to get them to sucking another ewe if the mother is lost. This is nearly always possible with a little patience. If one can shut the ewe and lamb together for a few days, her head confined between stakes so that she cannot hurt the wee one, and helping it from time to time to get its meals at first, the ewe will own it in nearly every instance.

If the lamb must be brought up by hand then use care not to overfeed at first. Have the milk from a cow not too long in milk. Some successful lamb raisers dilute it half with water. Feed the milk warm at regular intervals. I have raised splendid lambs by simply letting them suck a Jersey heifer, which after a time adopted them and loped them.—Joseph E. Wing in Breeders' Gazette.

Bordeaux Mixture a Thing of the Past.

A few years ago, says Rural New Yorker, one heard little except Boxdeaux Mixture at horticultural conventions when plant diseases were discussed. This mixture was once considered the only hope for farmers. Then came complaints of "Boxdeaux injury" and failure to do its work. There was a demand for a substitute. This year one rarely hears Boxdeaux mentioned. The talk is now for lime and sulphur, which has given remarkable results as a fungicide. The lime-sulphur alone or in combination with arsenate of lead comes as near to being a plant cure-all as we are likely to get in many years.

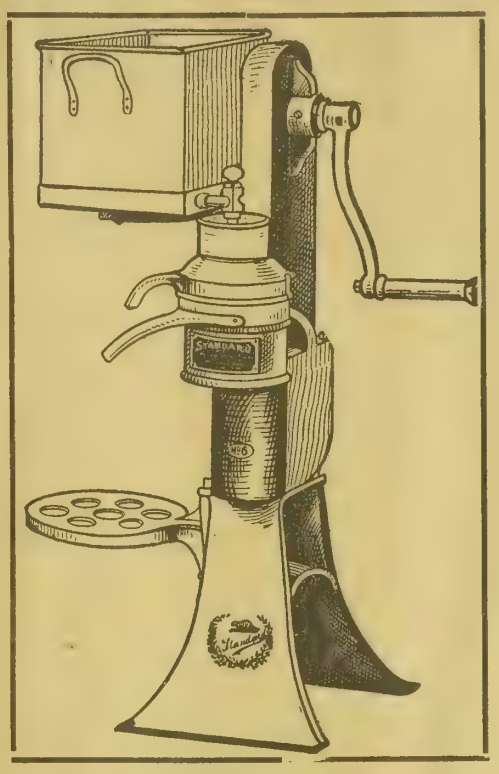
The STANDARD Cream Separator

THE LATEST AND MOST UP-TO-DATE.

Simple in Construction and Beautiful in Design.

Low Down Supply Can.

No Cans or Pans to catch Dripping Oil or Milk.



All parts enclosed and run in a spray of oil.

Crank proper height. Do not have to bend over to turn.

A Solid Stand with a Sanitary Base.

"STANDARD"
World's Greatest Separator.

The Standard is without doubt the most up-to-date Separator on the market. It runs practically without noise, and you have only to turn it to know it is the lightest running Cream Separator ever made.

A test, which we will gladly give, will prove to you it is the closest skimmer under favorable or unfavorable conditions, making heavy or light cream. It is easy to take apart and clean and put together. In provinces where this machine has been sold, it soon became a general favorite.

We will be glad to have you write us for further information.

Easy payments will be given reliable farmers.

AGENTS WANTED

We are just now arranging a selling organization in the Maritime Provinces and want Active and Reliable Agents in every district. Write us at once.

The Renfrew Machinery Co., Limited.

Agents Wanted !

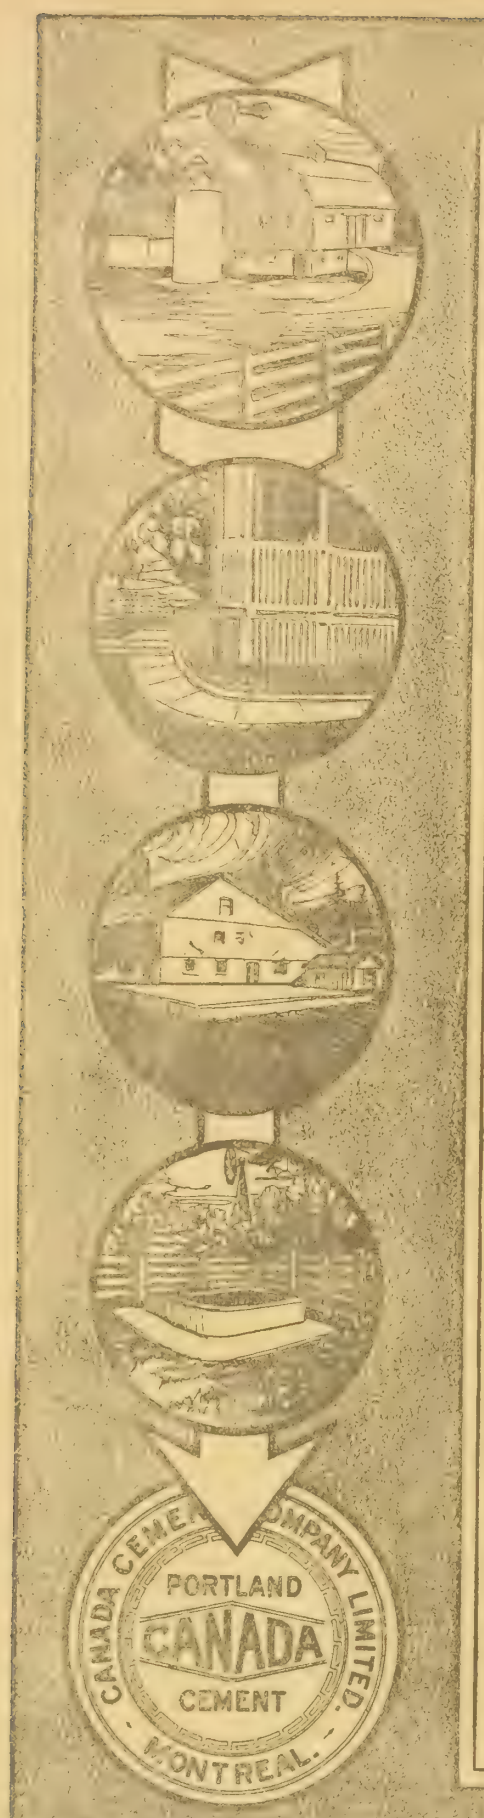
We want farmer agents in all parts of the Maritime Provinces to sell the Acme Stee Ladder.

It is one of the best propositions ever offered to a farmer who wants to make money during his spare moments.

Write to-day for particulars as to territory, etc.

The Acme Steel Ladder Co.,

Sussex, N. B.



$3,600 in Cash Prizes for Farmers

ARE you one of the thousands of Canadian farmers who have used or intend using Canada Cement for the construction of some farm utility? If you contemplate building anything whatsoever of concrete, make up your mind right now to build it with a view to winning one of the prizes we are offering. Read the rest of this announcement and you will learn how you may try for a share in the $3,600 we are giving away, to encourage the use of cement upon the farm. Throughout Canada the farmers have taken such a keen interest in our campaign that it has inspired us to go further along these educational lines. We have decided, therefore, to offer a series of four $100.00 prizes to each of the nine Provinces, to be awarded as follows:

PRIZE "A"—$100.00 to be given to the farmer in each Province who will use during 1911 the greatest number of bags of "CANADA" Cement for actual work done on his farm.

PRIZE "B"—$100.00 to be given to the farmer in each Province who uses "CANADA" Cement on his farm in 1911 for the greatest number of purposes.

PRIZE "C"—$100.00 to be given to the farmer in each Province who furnishes us with a photograph showing best of any particular kind of work done on his farm during 1911 with "CANADA" Cement.

PRIZE "D"—$100.00 to be given to the farmer in each Province who furnishes the best and most complete description of how any particular piece of work shown by photograph sent in, was done.

In this contest no farmer should refrain from competing, because of any feeling that he may have little chance against his neighbor who he thinks might use more cement than he does.

For it will be noted that Prizes "C" and "D" have no bearing whatever on quantity of cement used. The man who sends us the best photograph of so small a thing as a watering trough or a hitching post, has as much chance for Prize "C" as a man who sends a photograph of a house built of cement—and the same with Prize "D" as to best description.

Canada Cement is handled by dealers in almost every town in Canada. Should there not happen to be a dealer in your locality, let us know and we will try to appoint one.

Contest will close on November 15th, 1911, and all photos and descriptions must be in our office by that date. Awards will be made as soon as possible thereafter. The jury of award will consist of: Prof. Peter Gillespie, Lecturer in Theory of Construction, University of Toronto; W. H. Day, Professor of Physics, Ontario Agricultural College, Guelph; and Ivan S. Macdonald, Editor of "Construction."

Now, you cannot hope to do concrete work to the best advantage unless you have a copy of our free book, entitled, *"What the Farmer Can Do With Concrete."* This book tells how to construct well-nigh anything on the farm, from hitching post to silo. Whether you enter the contest or not, you'll find this book most helpful. A post-card asking for the book will bring it to you promptly. Send for your copy tonight. From your cement dealer or from us, you can obtain a folder containing full particulars of contest. If you send to us for it, use the coupon provided in this announcement.

The Canada Cement Co.
LIMITED
MONTREAL, QUE.

Please send me full particulars of Prize Contest. Also a copy of *"What the Farmer Can Do With Concrete."*

It will pay you to start your letter with the words: "I saw your adv. in The Maritime Farmer." Advertisers like to know that they are dealing with farmers who read a farm paper. Remember we guarantee you a square deal if you mention The Farmer.

What Will the "Average Cow" Do?

Editor Maritime Farmer:

Dairy farmers are rapidly awakening to the necessity of weighing and testing each individual cow in the herd. Twenty new cow testing associations have been organized in Quebec since the beginning of this year; twelve new ones have commenced operations in Ontario; two more in Nova Scotia, and one more each in Prince Edward Island and New Brunswick. This means at least four thousand more cows being checked up each month in addition to the 10,800 in 1910. Probably many more members will be added this month.

The extension work provided for by the establishment of Dairy Record Centres is proceeding briskly. Centres are already in working in Oxford and Peterboro Counties, Ont., St. Hyacinthe, Que., and at Kensington, P. E. I., with others contemplated. A supervisor has been appointed to extend cow testing in British Columbia.

Some cows have started with excellent records for January and February; yields of 1,690 and 1,490 lbs. of milk and over 50 lbs. of fat for the two months, are good indications of dairy possibilities for this season. What is the "average" cow intending to do this year?

Forms for recording weights of milk are supplied free on application to the Dairy Commissioner, Ottawa. When applying, the number of cows should be stated and whether forms are required for weighing daily or on three days each month.

Pest of Ants.

Editor Maritime Farmer:

In the Maritime Farmer, under date of March 7th, I see where an inquiry has been made as to how to destroy ants. In looking over some old papers I find an article in one dated May 24th, 1906, where a man had written a scheme which he invented himself. He goes on to sgy:—

"Remembering the fondness ants have for sweets, I filled a teacup half-full of granulated sugar, moistened and stirred it till it became a thick paste, to which I added a teaspoonful of Paris Green. I then placed portions of the paste in various places about the mounds. The ants soon flocked around it and devoured it and soon they were all destroyed."

As I never had any experience with ants I cannot vouch for its certainty but think it would be well worth trying. MRS. R. W. M.

Midland, N. B.

I have seen in the Home Department that B. McL., of Woodstock, N. B., would like to know a remedy to keep black ants out of the house. I would advise to paint all round the opening where the ants get in with kerosene oil.

J, ROSS DURLAND.

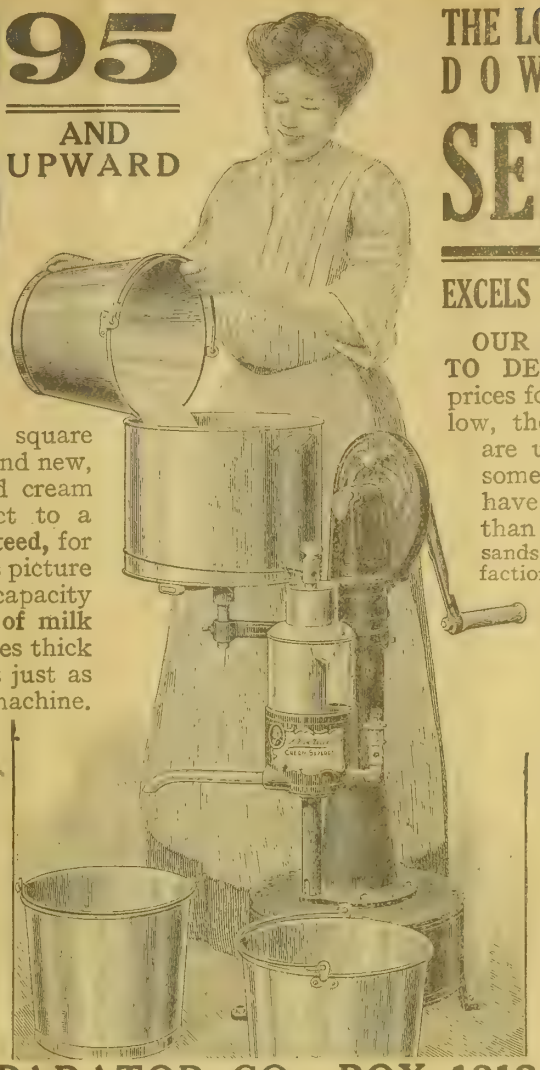
Digby Co., N. S.

A $5.00 Prize

We will give a prize of $5.00 to the person making the largest purchase from one or more of the firms advertising in the February, March and April issues of The Maritime Farmer. Send for catalogue and information to each advertiser and see if they have something that you want. The only condition attached to this offer is that you mention The Maritime Farmer when writing and that you send us a list of those to whom you have written and the amount purchased from each advertiser. We believe our advertisers can offer you better value than can be obtained elsewhere and see no reason why you should not patronize and secure this prize. All lists must be mailed us by April 30th. Address Advertising Manager, Maritime Farmer, Sussex, N. B.

$15.95 AND UPWARD

THIS OFFER IS NO CATCH



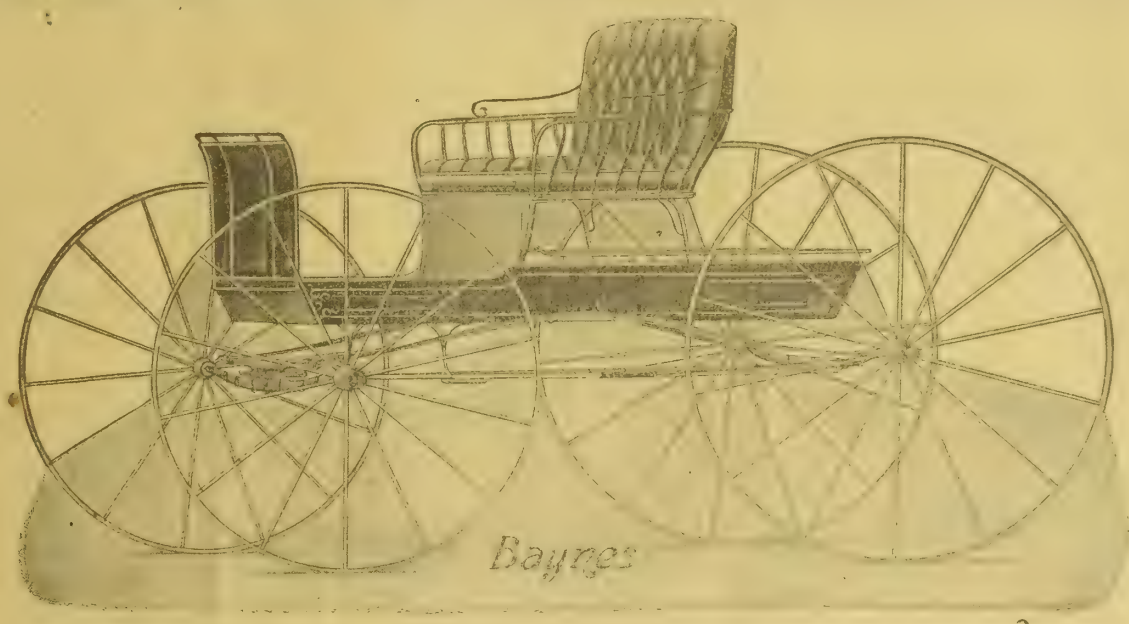
It is a solid, fair and square proposition to furnish a brand new, well made and well finished cream separator complete, subject to a **long trial** and **fully guaranteed,** for $15.95. Different from this picture which illustrates our large capacity machines. Skims **1 quart of milk a minute,** hot or cold; makes thick or thin cream and does it just as well as any higher priced machine. Any boy or girl can run it sitting down. The crank is only 5 inches long. Just think of that! The bowl is a sanitary marvel, **easily cleaned,** and embodies all our latest improvements. Gears run in anti-friction bearings and thoroughly protected. Before you decide on a cream separator of any capacity whatever, obtain our $15.95 proposition.

THE LOW DOWN AMERICAN SEPARATOR

EXCELS ANY SEPARATOR IN THE WORLD

OUR LIBERAL TRIAL ENABLES YOU TO DEMONSTRATE THIS. While our prices for all capacities are astonishingly low, the quality is high. Our machines are up to date, well built and handsomely finished; run easier, skim closer, have a simpler bowl with fewer parts than any other cream separator. Thousands of machines in use giving splendid satisfaction. **Write for our 1911 catalog.** We will send it free, postpaid. It is richly illustrated, shows the machines in detail and tells all about the **American Separator.** Our surprisingly **liberal long time trial** proposition, **generous terms of purchase** and the low prices quoted will astonish you. We are the oldest exclusive manufacturers of hand separators in America and cannot afford to sell an article that is not absolutely first class. You save money by dealing with us and at the same time obtain the finest and highest quality machine on the market. Our own (manufacturer's) twenty-year guarantee protects you on every **American Separator.** We ship immediately. **Cream separators are admitted into Canada free of duty.** Write us and get our great offer and handsome free catalog. ADDRESS,

AMERICAN SEPARATOR CO., BOX 1212, BAINBRIDGE, N. Y.



No. 578—PROVINCE ROAD WAGON.

New and unique in style—light in appearance and in reality—this makes a very "nifty" little rig It's easy on the horse, and exceptionally comfortable for the driver, for it's hung on those long, easy-riding E. T. Springs. If you like this type of a wagon you'll find the "Province" more than satisfactory.

BAYNES BUGGIES

have another improvement this year in the Baynes "Twentieth" Century Shafts—the strongest all-round shafts on the market. **The Baynes Unlimited Guarantee** for a full year, that goes with every buggy, is your protection.

See the Baynes Catalogue at your nearest dealers before you buy. It will pay you.

We want Local Agents throughout the East. Write for Territory and Terms at once.

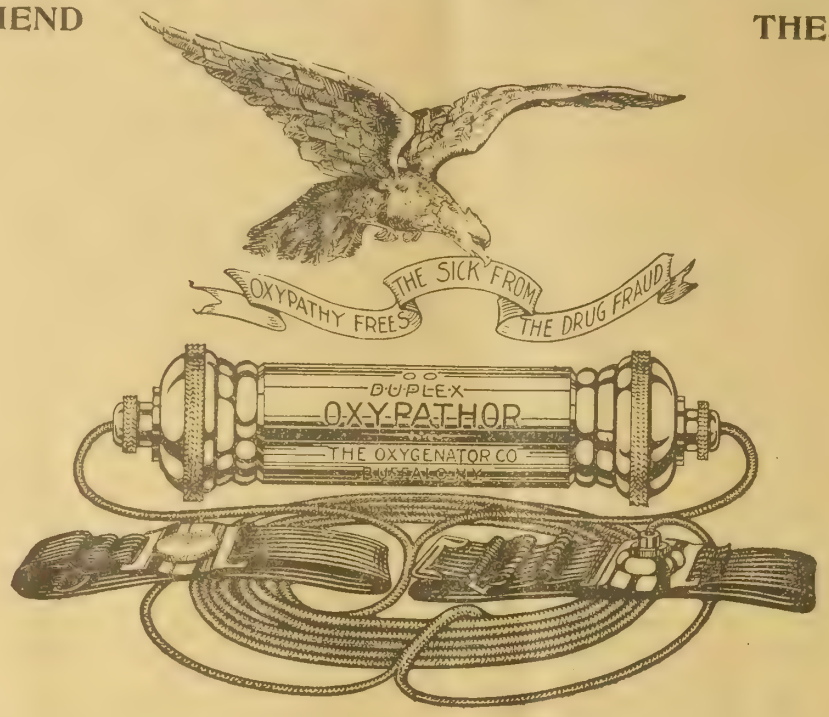
OXYPATHY

The Drugless Oxygen Cure—Quick, Sure, Safe, Cheap

"THE BEST FRIEND THE SICK EVER HAD."



By curing Diphtheria, Scarlet Fever, Infantile Paralysis, and similar ailments Oxypathy has ended the need for filling your child's pure blood with antitoxin—vaccine virus and similar filth.

You may not have the above ailments in which case remember that Oxypathy is equally valuable in the treatment of Rheumatism, Dyspepsia, Catarrh, and all Chronic diseases.

By its painless and easy victory over Appendicitis, Gall Stones, Blood Poison, and the like Oxypathy is saving thousands from the surgeon's bloody knife.

Break away from the drug fraud.

Don't wait until it is too late before you become acquainted with Oxypathy. Do it to-day.

NOTE—The action of Oxygenating instruments is governed by temperature **ONLY**. Statements to the contrary are wholly false, being designed entirely to deceive, defraud and mislead you. **REMEMBER THIS:**

Read what a few others say; we have thousands of such letters:

Mr. Clark and I have been much benefited by the use of the Oxygenator, also my niece, who had a severe attack of Quinsy.

I cordially recommend it for acute or chronic ailments.—MRS. ALFRED CLARK, 83 Queen Street, Custom House, St. John, N. B.

My little boy took very ill, the doctor pronounced it Diphtheria. Two days' treatment with Oxygenator cured him.

The Oxygenator saves money as well as life. —MRS. H. SHAW, Moncton, N. B.

The Oxygenator is a wonderful machine and I wish it understood I have one in my home. I would truly recommend it to any one suffering from Kidney or Bowel Troubles.—S. H. GANNONG, St. John, N. B.

Speaking from my own experience, I claim the Oxygenator is the best thing ever offered to the public, for the treatment of any disease.—J. M. AKERLEY, 25 Main St., St. John, N. B.

I have used the Oxygenator personally and on various members of my family, and I can recommend it as being of the most wonderful value in any household.—J. R. CAMERON, 12 Rodney St., W. St. John, N. B.

I have been subject to appendicitis, in constant dread of an operation, and recently had a very severe attack. The next day I purchased an Oxygenator and cured it. That was four months ago, and I haven't had the slightest attack since.—LAURA S. CHAPPELL, 189 Gordon Street, Moncton, N. B.

No matter who you are, from what you suffer, or how long you have been ailing OXYPATHY will help you.

WE STILL WANT

two or three more honest, energetic enthusiasts as district managers.

Send for our fine, free book Oxypathy—Nature's Royal Road to Health, and a copy of our magazine, The Searchlight.

They tell the beautiful story of this modern triumph and show how you benefit by Oxypathy.

What Alfalfa Would Mean to Nova Scotia

Editor Maritime Farmer'

If it were possible to grow alfalfa fairly extensively on all of our Nova Scotia farms, the increased wealth that would be derived from our soils would amount to, at least, 25 per cent. more than at present, and should be estimated at several millions of dollars. Judging by the correspondence we have received at Truro, there have been a great many attempts made to grow alfalfa throughout the Maritime Provinces, but so far we have had many more failures than successes reported. As you have already brought out in your paper, several conditions are required in order to get a successful stand of alfalfa. The most important of these is the character of the drainage. It takes very little exposure to wet conditions in the spring to destroy alfalfa.

Another very important feature, as you have also indicated, is the presence of the necessary bacteria. These are not likely to be present the first time the land is seeded with alfalfa and even if the newly seeded land is inoculated, either by artificial culture, such as is sent out from our institution, or by transplanting soil from a field where alfalfa has already grown well to the new one, there is good reason to believe that the germs will not become acclimatized and so virulent as when they have been in the soil for some years. This feature helps to explain the fact that almost every farmer in Canada, who is now successfully growing alfalfa, has had to report initial failures. These men have found out that the second or third seeding of alfalfa, no matter whether the first seeding was inoculated or not, has proved much more successful than the first seeding.

Judging by what I have observed in the Maritime Provinces, I am convinced that the majority of those who will experiment with alfalfa for the first this year, will only get, at best, indifferent results and in many cases will have to record a failure. I cannot too strongly urge these people, for the reasons above given, to continue their experimenting with this valuable crop.

Since there is a great liklihood of partial or complete failure the first year or two, it would be unwise for any farmer to experiment with more than a small plot. Where convenient, I would recommend trying two or three small plots on different parts of the farm, selecting preferably those places where red clover has grown best in previous years.

Success to you in your campaign for the encouragement of the growing of alfalfa.

PROF. M. CUMMING.
Truro, N. S.

Your money back if you don't get a square deal from any one whose advertisement in The Maritime Farmer you answer. That is what our guarantee means and it applies to every advertiser in The Maritime Farmer. But you will get a square deal.

The Best Way To Conserve The Natural Resources Of Your Farm

YOUR land is your biggest asset. On its power to grow good crops depends your very livelihood. What are you doing to insure its continued fertility—your future prosperity?

There is a great national movement on foot now for "The Conservation of Our Natural Resources." Don't think this applies only to our forests and coal mines. The soil, too, has been drained of its natural wealth by season after season of bumper crops. For your own good, join the soil conservation movement now. Begin on your own farm. There is a practical, economical, profitable way. Invest in an

I H C Manure Spreader

as hundreds of other farmers have done. By distributing your manure with one of these efficient machines you can keep your land always in top-notch condition. Barnyard manure is rich in the elements that enrich the soil, and an I H C Manure Spreader enables you to distribute it in the way to use all of it to the best advantage. I H C Spreaders are so designed that the manure can be spread in just the right amount required by the condition of the soil—a heavy coat where it is most needed—a light top dressing where that is best. They are simple and strong in every part. Their dependability has been proved by years of service.

I H C Spreaders are made in two styles:

Corn King Cloverleaf

in sizes suitable for any size farm.

Call on the I H C local dealer and see the one best adapted to your needs. Ask him about the bigger profits I H C Spreaders are bringing to users. If you prefer, write direct, or to nearest branch house for I H C Spreader catalogue and full information.

Wire Fences Good Investment.

Farm fences are too frequently given only secondary consideration. Aside from the buildings themselves, there is no asset of a farm which counts for more than good, substantial fences in good condition. In the first place, a farmer can turn out his stock in the morning with the assurance that when he goes for it at night he will find it in the same field. He is not worried half to death in haying and other busy seasons chasing stock and keeping them out of deviltry. A good fence adds much to the attractiveness and cash value of a farm, and a word picture of a tumbled-down and propped-up fence is not necessary to remind farmers that a good fence has a distinct cash value in its moral and suasive effects upon passers-by.

Few will question the superiority of a good wire fence for the average farmer instead of rail, board, brush, or anything of that character. They occupy less room, are more easily kept in repair, are more attractive and in other ways rank first. Eveo the first cost, once urged against them, hardly holds good today. Timber for fence rails is better used for posts, railroad ties, telephone poles, etc. The cost of a board fence to many is prohibitive. Nowadays when a man builds a new fence it is taken for granted that it will be of wire. The question at point will usually be what kind of a wire fencing is he using and what sort of posts are used.

USE GOOD POSTS AND GOOD WIRE.

This latter point is by no means unimportant. Chestnut, catalpa and locust are recognized favorites for durability. However, cedar and oak are not to be ignored. It is generally recommended that posts be dipped in some good preservative before placing in the ground to prevent rotting.

There are many types and styles of fencing on the market. For the asking the farmer can have free catalogs and descriptive data, and, perhaps, actual samples in a miniature form of the many fences. It is for each farmer to decide for himself the type which best answers his requirements.

To guide in the selection, remember that the weight per rod, the grade of the galvanizing and the quality of the wire are points to keep at the forefront. There are poor grades of wire on the market which are not well galvanized and the result is that the fence soon yields to the elements and breaks down. Every year hundreds of tons of barbed wire are used by farmers. While under certain conditions such wire gives satisfactory results, many call the barbs brutal, and do not enjoy patching up the wounds on stock occasionally caused by getting into barbed wire fences.

In a great number of cases barbed wire fence is being displaced by some sort of woven wire fencing which is more desirable, more attractive, will turn the stock just as quickly and effectively, and will not injure animals as will barbed wire. It is possible to buy all sorts of combinations as to density of meshes height of fence, etc. Therefore, whether a man is raising poultry, hogs, sheep, horses or cattle he can get a fence to suit his purpose. Fortunately, prices for these woven wire fences are within reach of the average farmer. Woven wire fences have come to stay and their use is rapidly on the increase, and justly so.

Now is the time of year when repairing and picking up about the farm are in order. It is the object of this article to call the attention of farmers to the importance of good fences, well maintained, and their value as a labor and money-saver.

POTASH Means PROFIT

when employed judiciously in conjunction with the required amounts of Phosphatic and Nitrogenous Fertilizers.

POTASH may be obtained in the highly concentrated forms of **Muriate of Potash and Sulphate of Potash** from the leading fertilizer dealers and seedsmen.

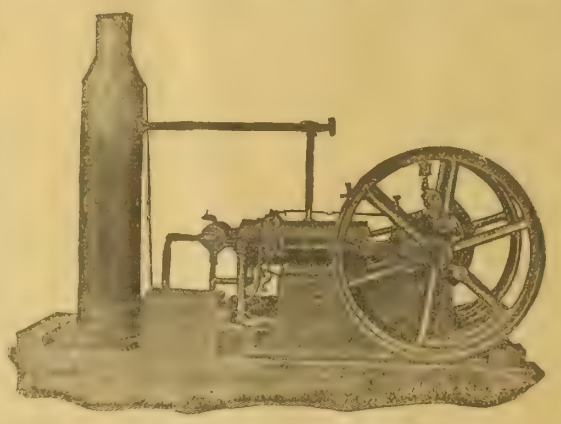
The Dominion Agricultural Offices of the Potash Syndicate,

1102b TEMPLE BUILDING, - TORONTO, ONT.

Farmers of Quality



Stationary and Mounted, in 1 1-2 to 30 Horse Power

Want Quality !

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of sealing directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

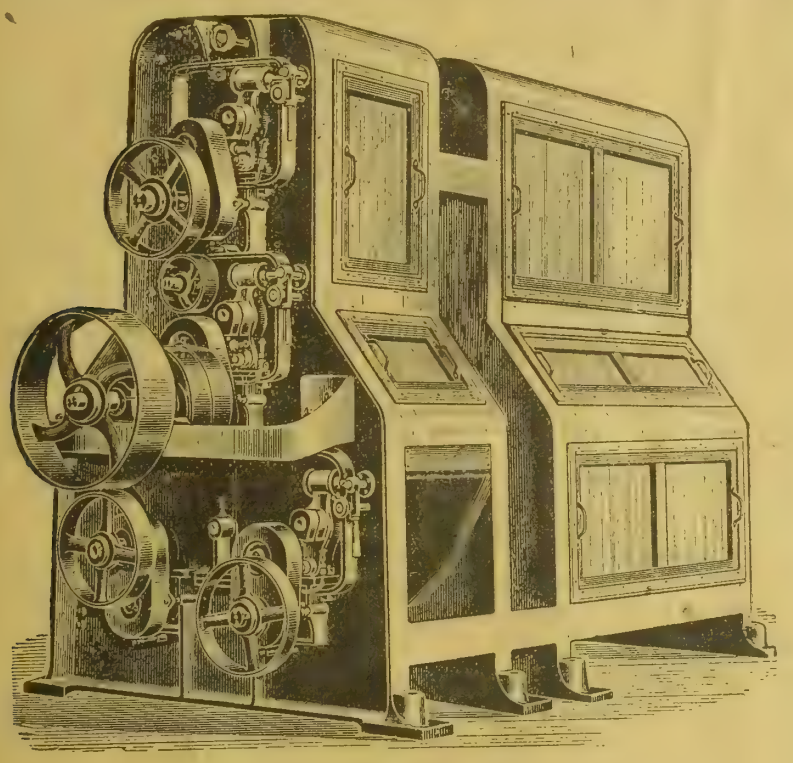
THE MIDGET MILL

In many parts of the world, notably in England, France, Spain and Italy, small millers who had lost all their trade, and given up making flour owing to the competition of the large roller mills have installed the modern Midget Mills and are now as prosperous and making as much flour as they did before the days of the roller milling. They can grind locally grown wheat and sell its products on the spot. This method has very substantial economic advantages of saving railway and a number of kindred charges which so greatly add to the cost of production of flour in the large roller mills.

In the old days all the advantage was with the small miller, and it is only owing to increasing demand for finest quality flour and the prohibitively large initial cost of a roller plant that the small men have been squeezed out.

In the following is given a short description of the machine which is reinstating the small miller in his old position and enabling new mills to be started in remote districts where the outlay for a large concern would not be warranted, thus bringing a machine capable of producing the finest quality of flour within the reach of men who have only small capital at their command.



The Midget Mill

DIMENSIONS.—The floor space occupied is 8 feet by 4 feet, the driving pulley, which is 20 inches in diameter, projects 20 inches beyond the end of the mill, the height is 6 feet 3 inches without the exhaust fan, this gives precisely the space required in a building for the mill. Its weight is about 2 tons 10 cwt.

DRIVING POWER.—The mill is driven by a single 3 inch belt. The power required is about 3 B. H. P. The speed of the driving pulley is 300 revs. per minute.

ROLLERS.—The roller section of the Mill consists of 2 pairs of fluted break rollers and 2 pairs of smooth reduction rollers, all rollers are 5 inches in diameter and 14 inches long. The moveable roller of the pair is in each case adjusted by a patent arrangement which makes it impossible for the rollers when once adjusted to ge get out of parallel; after numerous experiments a special grooving for the break rolls has been perfected, which while thoroughly cleaning the bran, keeps it broad and preserves the inside of the grain pure from branny particles, so that there is no need for the semolina to be further purified before being reduced to flour on the smooth reduction rolls.

SCALPER. — A patent vibrating sifter follows the first break rollers, the outsiftings of which pass to the flour dresser, the tails drop to the second break rollers.

After each rolling the stock is carried to the dressing section of the machine to have the flour dressed away from it, and the semolina is carried back to be re-rolled.

The arrangements for feeding the stock on to the rolls, and for conveying it backwards and forwards between the roller and dressing sections of the machine are simple and unlikely to get out of order or to damage the stock.

FLOUR DRESSING.— The flour dressing section of the Mill consists of four centrifugals, each 3 feet 6 inches long by 14 inches diameter. These dress out the flour after rolling, drop the bran and sharps into separate sacks, and return the semolina to be re-rolled.

In the whole machine only one elevator is used. This is built in and forms a part of the machine. Owing to the short, quick process employed, the resultant flour is kept clear and bright, its natural color is preserved, and its volatile oils are not evaporated by reason of the interminable operations which obtain in modern practice, where endless elevators and spout connections are employed. In consequence the flour made on the Midget is a better color, retains its natural moisture longer, and makes a sweeter loaf than that made on the elaborate plants.

EXHAUST FAN.—A small fan is placed at the top of the Mill to ventilate roller and dressing sections, to keep the whole cool and free from moisture, the fan may be discharged into the open air or into a small exhaust chamber. The waste from its use is a negligible quantity, not amounting to 1 lb. per day.

CAPACITY.—The capacity of the Midget varies to a certain extent with the class of wheat milled, it will deal with 220 lbs. of large grained damp English wheat in an hour.

Amatite ROOFING

"THIS IS THE ROOFING THAT NEEDS NO PAINTING"

AMATITE means more to the man who needs a roofing than just merely something to put on the top of a building.

It means a thoroughly satisfactory and reliable roof covering, without future *expense for painting*—because the *real mineral surface* makes painting unnecessary.

Frequently the cost of painting a roofing amounts to almost enough to buy a new Amatite Roof.

Amatite can be laid right over shingles, tin or other ready roofings. The directions hold good for laying Amatite anywhere and over anything, and are as simple as A B C.

For further information, booklet, samples etc., address nearest office.

Everjet Elastic Paint

A very tough, durable paint at a low price. One color only—a lustrous black. Use it for machinery, heating apparatus, smokestacks, roofs, fences, water tanks, etc.

Creonoid *Lice Destroyer and Cow Spray*

Cows give more milk if sprayed with Creonoid to keep away the flies which make them restless. The poultry output will be increased if the hen house is made obnoxious to insect pests by disinfection with Creonoid.

But with small, dry Canadian wheat, the capacity is as high as 300 lbs. per hour of winter wheat and 250 lbs. for spring varieties.

PERCENTAGES. — The percentages and quality of flour obtained an be varied at the will of the operaor. The following are tne percentges from three most common arangements:—

(a) 70 per cent. very good quality straight run flour.

(b) 50 per cent. fair quality flour.

(b) 20 per cent. finest quality patnt flour.

With each of these arrangements 14 p. c. bran, 10 p. c. fine sharps and 6 p. c. coarse sharps are obtained.

(c) 55 per cent. very fine flour.

20-25 p. c. second quality flour.

75-88 p. c. Total.

With this arrangement 13 p. c. of bran is obtained, and 7-12 p. c. of sharps all one quality.

FITTING AND WORKING.— The Midgets are sent forward from the orks completely fitted and adjusted fter a trial run, they can easily be xed down on a prepared floor and tarted off immediately. All you ave to do is to lace on the silks, oil he bearings, feed the wheat into the hopper and remove the flour, bran, tc., as they are made. The Midet does the rest.

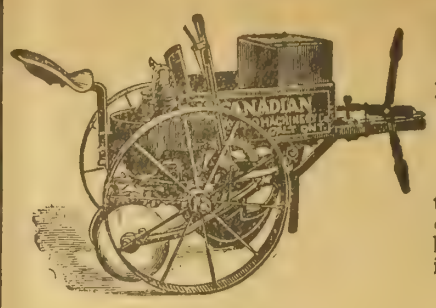
Editor's Note.—We understand that a number of progressive farmers at Hoyt Station, in Sunbury County, who are interested in wheat growing nave received the assurance of one of their prominent citizens that if the farmers of that district will agree to sow at least 150 acres of heat for three consecutive years, he will establish a flour mill. We have heard complaints from many sections where wheat can and is being grown that they are handicapped by having to take their grist long distances to be ground. It is possible that the foregoing article may prove of interest to our readers in those sections.

Editor's Note:—If any of our readrs are interested in this matter and will write us we will furnish them with any information they may require in regard to the Midget Mill.

A $5.00 Wire Fence Prize

We will give $5.00 in gold to the person who finds the word "fence" or "fences" the most times in ads. in this and succeeding issues betweent now and May the 31st. It doesn't cost you one penny to try for this $5.00 but in looking for the word "fence" note which fence ads. interest you most, and write those advertisers, sending an order or asking for free catalogue. In your letter to us telling how many times you find the words "fence" or "fences" you must give us the names of all fence advertisers in this and succeeding issues up to May 31st, to whom you have written mentioning The Maritime Farmer. This is an easy condition, and the catalogues or fences you buy will be worth much more than you pay. Go to work. The $5.00 will be mailed promptly to one finding them most times. Tell how many times you find them on each page. In case of tie the prize will be divided. Don't delay. Don't cost a cent to enter. You might as well have the $5.00 as you are going to write for catalogues, so do it now. Lists must be mailed by May 31st, 1911.

Chamberlain's Stomach and Liver Tablets assist nature in driving all mpurities out of the system, insurng a free and regular condition and restoring the organs of the body to health and strength. Sold by all dealers.



POTATO PLANTER.

If You Want Durability, Reliability and Simplicity, You Get Them in the O. K. Canadian

It requires only one team and man to plant your crop. Its automatic cup device does not puncture or bruise the seed in any way; handles it almost as carefully as by hand.

Write for our 1911 Catalogue.

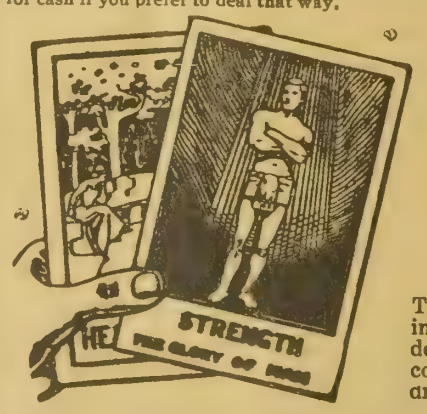
Canadian Potato Machinery Co., Ltd., 118 Stone Road, Galt, Ont.

This Man is Young at 55 Years.

He is a "Health Belt Man;', therefore has the vitality and hot, red blood of youth in his veins; he towers like a giant above the ordinary difficulties of life—be a "Health Belt Man" yourself—it gives manly Strength; it makes you young and keeps you young all the days of your life; it takes all the coward out your make-up—let me give you of this abundant vitality, then nothing can ever conquer you but death itself—100,000 men have taken my advice, why not you ?

The secret of life-long youth may be summed up in one word—Vitality. If you have this great natural power in abundance years count for nothing. I use no drugs, I recommend none. Just the Health Belt. No privations, no dieting and no restrictions, excepting that all dissipation must cease. Put the Health Belt on nights when you go to bed; let it send its power into your nerves, organs and blood while you are sleeping It gives you a great flow of soft, gentle, galvano-vital electricity during the entire night. One application and you are like a new being; it takes all the pain and weakness out of your back; it makes you answer the morning greeting with "I'm feeling fine." It is a great strength builder; it overcomes the results of earlier mistakes and indiscretions; it gives you a compelling power, so that you are attractive to all women and men with whom you come in contact. Three months' use is sufficient, S. Coolen, Hubbards Cove, N. S., writes: "I am a man again, thanks to you. Nothing can discourage me now." This is one among tens of thousands.

Free Until Cured. Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.



These Nature Cure Books FREE

Let me send you these books. They contain much valuable health information, are fully illustrated, describe my Health Belt. Fill in coupon or send your name and address on a postal card.

DR. M. F. SANDEN CO., 140 Yonge Street, TORONTO, Ont.

Dear Sirs—Please forward me your books as advertised free.

HE WANTS THEM ALL TO KNOW

ABOUT GIN PILLS

They Cured Him and He Knows They will Cure Others

DAVISVILLE, ONT.

"I want to let you know what GIN PILLS have done for me. I had trouble with my Kidneys and Bladder so I got a sample of GIN PILLS and followed directions. I felt better after the first dose and I kept taking them for a month.

One day, Mr. Simpson of this town, told me about the trouble he had with his kidneys and I recommended him to try GIN PILLS, and gave him one to take. The next day he bought some for himself and both he and his wife have received great benefit from them. I have also induced many others to try them.

I am trying to get my sister-in-law to try them. I wish you would send me a sample box to give her."

HERBERT H. BAUER.

If you have a friend who is suffering from Kidney or Bladder Trouble or Rheumatism, send name and address, and we will gladly mail a free sample box of GIN PILLS. At dealers, 50c. a box, 6 for $2.50, or sent on receipt of price. Remember—GIN PILLS are guaranteed to give relief or money refunded. National Drug and Chemical Co. Dept. M. F. Toronto.

National Lazy Liver Pills regulate liver and bowels, and cure Constipation. 25c. a box.

PIES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Every Woman

is interested and should know about the wonderful

MARVEL Whirling Spray

The new Vaginal Syringe. Best—Most convenient. It cleanses instantly. Ask your druggist for it.

If he cannot supply the MARVEL accept no other, but send stamp for illustrated book—sealed. It gives full particulars and directions invaluable to ladies.

WINDSOR SUPPLY CO., Windsor, Ont. General Agents for Canada.

Flax as a Stock Food.

Flax seed is the greatest stock food in existence. It will actually do most of the things patent stock foods are claimed to do. It is a very satisfactory substitute for butter fat when fed with skim milk to calves. It has a great power of toning up the system of an animal. It puts a horse in good physical condition in a very short time.

The high price has made its use prohibitive on most stock farms. Some farmers, however, raise a small patch of flax each year and they find it one of the most profitable crops they can raise. Flax seed is commonly boiled a short time and allowed to cool. It then forms a thick, oily, jelly-like mass. This is mixed with milk or grain and fed. Another common practice is to grind it. Some preparation is always necessary, as its thick, leathery coat causes it to pass through the body undigested.

Interesting the Boys.

We have the following letter from a prominent farmer in Inverness Co., N. S., which contains an idea that other fathers might adopt.

Editor Maritime Farmer'—

Enclosed please find eighty cents in payment of subscription to your paper for 1911. Please address this year to Donald S., instead of Archibald S. Donald is the oldest of my boys and I want him to take an interest in farming. I sent him to the short course this year and he is since taking more interest in matters relative to farming.

Wishing you every success with your paper for 1911. I remain,

Yours very truly,
J. ARCH MACDONNELL.
Port Hood, N. S.

A Progressive Firm.

One of the most progressive firms of meat dealers in Prince Edward Island is the firm of Blake Bros., Charlottetown. It was a rare treat to those who have been eating the beef of dairy bred steers to visit this firm's stables, near Charlottetown, and there see some excellent Shorthorn steers that were imported from Ontario last fall and are being fattened for the Easter market. Five of these steers were exhibited on the Market Square, Charlottetown, on one of the days during which the farmers were in session. Their weights were 1950, 1900, 1800, 1680 and 1650 lbs. This progressive firm has also recently imported a carload of steers to fatten for their spring and summer trade. Metsrs. Blake says they would handle all the stock of similar quality that Prince Edward Island farmers could produce and they have no hesitation in saying that it is a pity that more of the farmers do not try to raise, at least, a few good steers every year.

$5 00 Free.

To the reader who finds the words "seed or seeds" in advertisements in this issue of The Maritime Farmer the largest number of times, we will give $5.00 in cash. If there should be a tie the money will be equally divided between those having correct counts. The words "seed or seeds" in The Maritime Farmers' own advertisements or in the reading matter will not count. The contest closes May 30, 1911. Send in your count. You may get the $5.00. Mention the names of any advertisers to whom you have written or of whom you have bought goods, also tell about how much you or your family have paid for seeds or trees of any kind that your family has bought within the last year.

I H C OWNERS ARE PROUD OF I H C WAGONS

There is a certain pride in owning a wagon that you know is built of the highest quality materials obtainable—a wagon that is not only attractively finished with the best paint and varnish, but which also gives perfect service, day after day, and year after year. That's why I H C owners are so proud of their wagons.

If you want to be proud of your next wagon—choose one of these two in the I H C line—

Chatham or Petrolia

The loads they carry, the roads they traverse, and their wonderful durability make others wish they had bought a Chatham or Petrolia.

Chatham Wagons have a long record for satisfactory service in Canada. Made with hard maple axles, oak bolsters, sand boards; rims, and spokes, and oak or birch hubs—they represent the highest standard of wagon construction. When you buy a Chatham wagon it is with the assurance of getting the utmost service and satisfaction out of it.

Petrolia Wagons are constructed of first quality woodstock which is thoroughly seasoned by being air-dried. The ironing is of the very best. The inspection of each part is most rigid.

Be sure to call on the I H C local agent, get a pamphlet, and let him show you one of these wagons. If you prefer, write the International Harvester Company of America at nearest branch house for any information you want.

IHC Service Bureau

This Bureau is a clearing house of agricultural data. It aims to learn the best ways of doing things on the farm, and then distribute the information. Your individual experience may help others. Send your problems to the I H C Service Bureau.

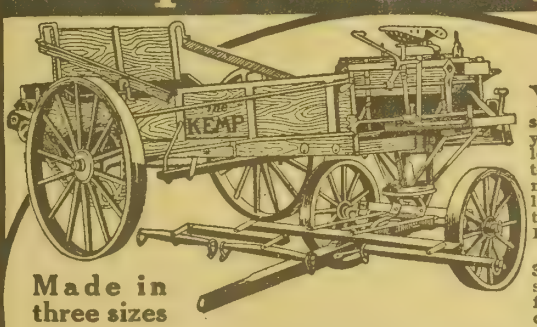
Inside Facts About Kemp Manure Spreaders



Strong Where Others are Weak

YOU who continue to spread manure over your land by hand, learn how it is possible to cover three times as much ground with less labor and increase crops 10 to 15 per cent by using the Kemp Manure Spreader.

This spreader is the result of 39 years' experience in building spreaders of all kinds. It is the first one that will handle all sorts of material, thoroughly pulverize and distribute it evenly, and has one-third lighter draft than any other spreader ever built.

Made in three sizes

The secret of the wonderful success of the Kemp Manure Spreader lies in the Flat Teeth used on the Cylinder Bar. Because these teeth are wide and graded, we need only have one-third as many used on other machines. This does away with the manure backing up and clogging, reduces friction on the cylinder—and correspondingly lightens draft.

The machine is also equiped with the strongest and most practical change of feed ever put on a spreader, while the Apron has a friction return so the operator has it always under control. The Kemp Manure Spreader will economize labor more than any other farm implement and, by increasing the fertility of the land, will pay for itself in no time.

Settle your doubts, once and for all, concerning what kind of a spreader you want on your farm, by writing for our free book 75 which tells the inside facts about Manure Spreaders. Write today—address,

Frost & Wood Co. Limited 75
Smith's Falls, Canada

1/3 Lighter Draft

Handles All Kinds of Material

The Passenger Pigeon

NOT DISCOVERED LAST YEAR—RENEWAL OF SEARCH. A REWARD OF $1,000 FOR FIRST INFORMATION AS TO THE LOCATION OF A NESTING PAIR, WHEN PROPERLY CONFIRMED.

The search for the Passenger Pigeon will be carried on for another year. No person was successful last year in finding this finest and noblest of all wild pigeons. Whereas forty or fifty years ago great flocks comprising hundreds of thousands, or even millions, were frequently observed, much doubt exists as to whether there are any left today. Its range extended over the portion of the American continent east of the Rocky Mountains and as far north as Hudson Bay.

Last year many reports were received to the effect that the long-lost pigeon had been found, but on further inquiry, and on demanding a deposit of $5.00 as an evidence of good faith and care in its identification before we incurred any expense in confirming the discovery, it turned out that some other bird had been mistaken for it, and nothing more was heard of it.

All finds are to be reported to Dr. C. F. Hodge, Clark University, Worcester, Mass., or to the undersigned. The awards are offered solely and only for information of location of undisturbed nestings. We do not desire to obtain possession of any birds dead or alive, but we are working solely to save the free wild pigeon.

To insure intelligence and good faith informants of nestings are advised to enclose, or agree to forfeit, at least $5.00, in case they have failed to identify the birds correctly. This is only fair, since the amount may cover only a small part of the costs occasioned by a false report. The money will be immediately returned if the birds are found to be the true wild passenger pigeons.

In sending reports give exact date, hour, number in flock, direction of flight and descriptions of the nest, the eggs and the birds themselves.

Last year the Mourning Dove, the Band-tailed Pigeon of the Pacific Slope and Cuckoos, were mistaken for Passenger Pigeons.

Passenger Pigeons nest during April or May, making rude scanty platforms of twigs through which the eggs can be seen. The nests are usually from 10 to 30 feet above the ground and are apt to be found in any woodland. There is usually one, sometimes two, elliptical white eggs, 1½ inches by 1 inch, in each nest. The Passenger Pigeon is 16 inches long from bill to end of tail, of slender build, and has a long graduated tail, that is, the central tail feathers are about twice the length of the outer ones. The male is blue-gray above and on the head and ruddy underneath; the female is duller colored, inclining to brownish.

The Mourning Dove is shorter by 4 inches, and both sexes have black spots on the ears and brownish backs The forehead of the adult is vinaceous brown, and the nest is usually less than 10 feet from the ground.

Observers should be absolutely sure of the identity of the bird before making a report. If the nest contains eggs, haste in reporting is unnecessary as the young birds will remain in the nest for three weeks or more before leaving.

It should be remembered, too, that the rewards are offered for undisturbed nests. The birds must not be molested in any way, watch them closely from a concealed position with a field glass and ascertain for a certainty that they are Passenger Pigeons before reporting.

W. LOCKHEAD.
MacDonald College, P. Q.,

The Double-Action Cutaway Disc Harrow Doesn't Have To Run On The Half Lap

ALL farmers know what that means—that this harrow does not have to run in the half lap—know the saving in time and labor. The Double-Action Cutaway Disc Harrow runs true in line of draft and keeps the surface of the land true.

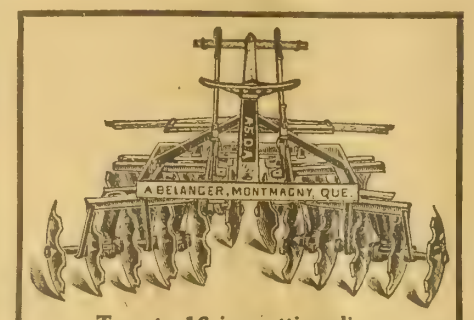
On light sod or tough stubble land, it may be driven in the half lap and will make a perfect seed-bed in one operation.

Drawn by two medium horses, it will move 18,000 tons of earth one foot a day.

The condition in which it leaves the land means an increase of 25% to 50% in crops; and there is only one operation—it is a plow and harrow combined.

The discs are adjustable—can be set to move soil any distance from an inch to a foot—thoroughly pulverize and aerate the land—stir up the soil—let in the air and sunshine—purify and vitalize it—make it just right for crops.

Hon. Sydney Fisher, Minister of Agriculture, recently ordered a second one for his own farm. That looks like satisfaction, doesn't it? Thousands are in use.



Twenty 16 in. cutting discs placed in two rows.

If your dealer won't supply you, write us and we will tell you where you can get one. Send us the letter to-day.

A. BELANGER
Established since 1867
at MONTMAGNY Que

THIS book, well worth a dollar if you had to buy it, will be given FREE to any farmer who is interested and who will fill out the coupon as an evidence of good faith. It is a scientific treatise on the preparation of the ideal and perfect seed-bed,—tells about "Soils and Fertilizers," "Plowing and Plows," "Seeds and Seeding,"—facts you owe it to yourself to know.

Use The Coupon For The Free Book

and it will come to you by return mail—the first copy FREE; extra copies will cost you one dollar. We want you to have it if you own or operate a farm—don't put off sending—the edition is limited—send to-day—NOW. Use the coupon.

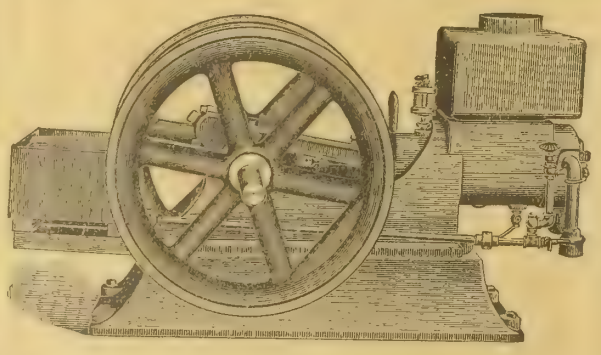
Don't Wait for a Gasoline Engine Agent



to come to your house if you are thinking of buying. Write to the different makers or their representatives and get catalogues. Investigate the different makes thoroughly before you buy. You will have to pay good money and do not want to be disappointed. Remember, that if you make a mistake in purchasing it will worry you as long as the engine lasts. You cannot afford to take chances. These are the things that confronted us when we went into the markets of the world to select an engine that would give you satisfaction. Our experts went not to the factory where they were made, but out in the fields, the workshops and other places where they were being used, and found out just how each make of machine was doing. Every working part was thoroughly inspected. Not one dollar of expense was saved in order that we might get the best. We could not afford to take chances. Our organization is too big, our interests too great, our reputation too dear to us to allow even the slightest defect to creep in. We went at the Gasoline Engine business thoroughly and we believe you should do the same. We want you to find out for yourself just how good our Gasoline Engine is. We have 200 agents in the Maritime Provinces. Every county is represented. We can have a man call on you any day, but before we have him call we would like you to write us for our catalogue. It explains the things you should know about Gasoline Engines. Other information regarding our selling plan will be given you by our representative.

J. D. FRIER, - - Sussex, New Brunswick

Quality Butter

That's the kind you make with Maxwell's "Favorite" Churn.—

Maxwell's "Favorite" is used all over the world—in Denmark, the butter country of the world—in the United States, in spite of high tariffs—and in every Section of Canada. Our Agricultural Colleges and Govt. Inspectors recommend it, because it is the finest butter-maker in the world.

Write for catalogue if your dealer does not handle it.

C. A. KING, M. D.

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 309, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

Prompt relief in all cases of throat and lung trouble if you use Chamberlain's Cough Remedy. Pleasant to take, soothing and healing in effect. Sold by all dealers.

For Pure Maple Products.

Following is the text of a widely circulated and extensively signed petition that the maple products manufacturers of Canada have forwarded to the Minister of Agriculture:

To the Honourable Sydney Fisher, B. A.,
Minister of Agriculture,
Ottawa, Canada.

Sir,

We, the undersigned PURE MAPLE SYRUP and PURE MAPLE SUGAR manufacturers, of the Dominion of Canada, do respectfully beg to petition the Government of Canada, and particularly you, as Minister of Agriculture, to so amend the Adulteration Act as to give greater protection against having our pure maple products sold throughout Canada in open competition with adulterated syrups and sugars.

We wish to express to you our greatest appreciation of the keen interest you take in all matters pertaining to Agriculture. We appreciate what you have done for the Maple Sugar Industry in the way of publishing Bulletins, and using your influence with the Minister of Inland Revenue to have an analysis of maple products made each year. The combined actions of these two Departments of the Government Service has greatly stimulated the production of pure maple syrup and pure maple sugar.

While these two Departments have been active towards assisting the manufacturers of maple products, the adulterators have at the same time been active in trying to work out some syatem of adulteration whereby, by the careful blending of foreign sugars or foreign sugars and maple products, it has been somewhat difficult for the analytical chemists to determine just what should be classed as "adulterated" and just what should be classed as "pure". This action on the part of the adulterators is causing the pure maple syrup and pure maple sugar manufacturers great annoyance and it is with this idea in view that we are hereby petitioning you to amend the above named act.

You have, by legislation, assisted the butter and cheese industry of Canada; you have, by an act of Parliament, prohibited the manufacture and sale of olemargarine, butterine, and spurious butter; you have, by the Fruit Marks Act, given protection to the honest fruit packer, and by the Seed Control Act, made it illegal to sell bad seeds. We, therefore, do not consider our request unreasonable, and would humbly pray you to grant our petition, and so amend the Adulteration Act by making it illegal to have the word "Maple" or any of its deritatives appear on the labels of any packages of maple syrup or maple sugar unless the same be guaranteed absolutely pure, and not a mixture containing compounds of foreign sugars.

And your petitioners will ever pray.

A Prize of $5 00

We will give $5.00 to the school boy or girl who makes the most number of words from the letters contained in the word "Alfalfa." No letter is to be used in one word oftener than it appears in the word "Alfalfa". The only condition is that each person competing must send in at least one paid in advance new or renewal subscriber to "The Maritime Farmer." Make up your lists boys and girls, show them to your friends, get them to help you win the prize by subscribing for The Maritime Farmer. Contest closes May 30th. Address Circulation Manager, Maritime Farmer.

Lunenburg, N. S.

Potato Quality.

What the market wants and needs is a potato of quality. The market does not actually realize that want, and the people who look to the market for that chief article of food do not yet,)as a general thing, know their need. The question of quality in the potato is beginning to burn, however, and various movements, looking to the end of establishing an aristocracy of the potato, are under way. It was but a short time ago that we suggested in this column an organization of potato growers, the object of which should be to improve the quality of the vegetable and regulate the marketing of the product. Now we notice that such organizations are being formed or considered. The effect must be beneficial

For so long a time that it may be said to be always, there has been no attention paid to the quality of the potato, except)to see that it was not rotten when it was sold. Now, however, there are more than a few people who want a potato that will come up to a certain standard of pleasing cooking and eating qualities and the growers must pay attention. If Maine heeds this growing demand and enlarges the demand by educating the people up to a desire for quality potatoes, the state may maintain its leading place as the potato state, and at the same time make the potato growing portion of the farming industry much more profitable.

The character of a quality potato is not difficult to determine. It should be only moherate size, with shallow eyes, smooth and perfect skin and regular shape. In texture it must be mealy and free from water after it has been boiled, while retaining its firmness until crushed. When taken into the mouth, it should have a pleasant, rich potato flavor, such a flavor as would make it thoroughly palatable to a hungry person without either gravy, butter or salt. That's the kind of potato Maine should produce and stake her reputation upon.—Maine Farmer.

The Island Seed Oat House.

THE BOOK DESCRIBES EVERY STEP IN DETAIL

IN the organization and construction of rural telephone lines, this book, "How to Build Rural Telephone Lines," is a practical guide. It is a carefully classified volume, covering everything you need to know, from the inception of the idea to the moment the telephone is hanging on your own wall, ready for you to use. No question on the building of rural telephone lines can possibly arise without your being able to find the answer to it in this volume. It offers explanation on every point—the solution for every problem. If you are even the least bit interested in the subject, all you have to do is to clip, sign and mail the coupon and

We Will Send You FREE This Book on "How to Build Rural Telephone Lines"

Bear in mind that **you have to ask** for this volume to get it. This book represents 100 profusely illustrated pages of vital facts, bound in stiff, cloth-covered binding. Apart entirely from the cost of printing and binding, this book represents the brain work of experienced telephone men—has cost us so much money that we really ought to make a charge for it. So long as the edition lasts, however, we are willing to send it FREE to every farmer who, by using the coupon, signifies that he is interested in the subject. This book is very frank, it tells you exactly what you can do, what you must do and what you cannot do; you will be interested in the straightforward way in which it comes out with vital information. Systems of rural telephone lines are spreading a network throughout the Dominion in the form of community-owned companies. Sooner or later someone will organize such a system in your locality. Why shouldn't **you** be the man to do it? In any event you owe it to yourself to know all there is to know about this subject. Better send the coupon NOW, while you are thinking about it.

A PREMIUM THAT BEATS ALL

YOUR OPPORTUNITY!

NEVER before in the history of The Maritime Farmer has there been shown such a rapid increase in the circulation as during the past season. Read the description found below of one of the most remarkable premium offers that has ever been put on in this part of the country. It is sterling worth, a real premium and something that nine out of ten homes will welcome. It costs you practically nothing to have The Farmer and at the same time fit your kitchen for quicker, more pleasant and efficient service. Housewives see to it that you do not fail to get one of these handsome premiums while they last. The supply is limited and this offer may not appear again.

Description of the 8-piece Set

No. 1—A 7-inch Meat Cleaver, one of the handiest of kitchen tools, well balanced and of tempered steel. Light enough for anybody to handle, yet heavy enough to be very effective.

No. 2—An 8-inch blade Kitchen Knife; no better knife can be had; made of tempered steel and a keen edge and a knife that will do valiant service as long as there is a strop of it left.

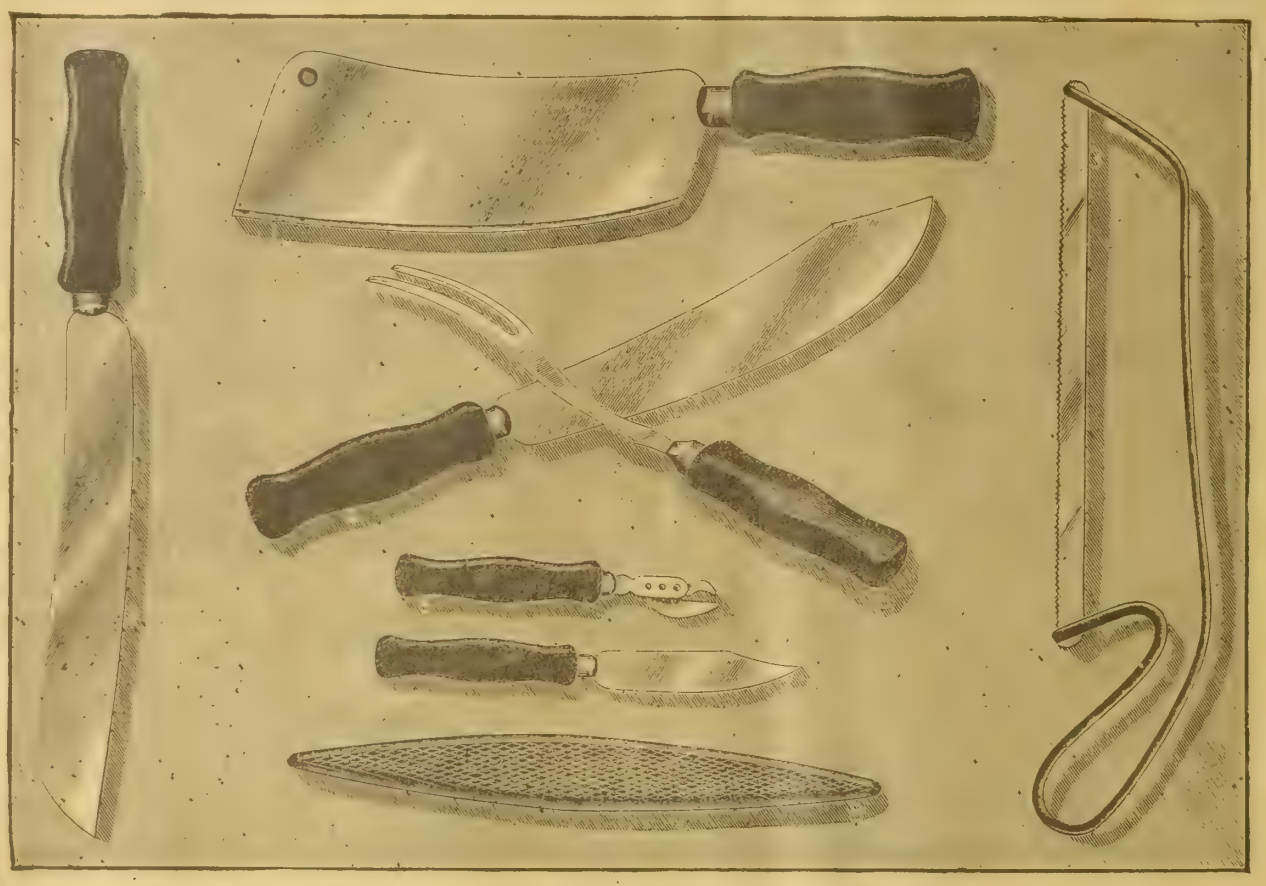
No. 3—The handiest of kitchen tools, a real Meat Saw, 8 inches in cutting service. It is sharp and set wide so as to cut with ease. No kitchen is complete without it.

No. 4 and 5—A serviceable Carving Set; just the thing for actual service; handsome enough to use on the table if you desire; sharp enough to carve any meat and made of best tempered steel. A valuable part of this set.

No. 6.—A Can Opener that will open cans. No danger of cutting your hand on the tin; strong and substantial; will cut any can top; made of best steel; will last a lifetime.

No. 7—A keen, properly shaped Paring Knife. Will pare the thinnest peel and do it quickly; sharp-pointed for cutting out cores, etc. No kitchen is complete without it. A beauty and a dandy.

No. 8—Every housewife wants something to keep her knives sharp. This whetstone, made of the finest material, will put an edge on any knife with a few strokes. Nothing so handy in the kitchen as the real whetstone. This one is the best for kitchen use that can be found.



THIS IS THE SET

Our Kitchen Set Outfit consists of the following:

One Kitchen Cleaner, best cutlery steel, fully warranted,	$0.65
One Bread Knife, best cutlery steel, fully warranted....	.50
One All Steel Butcher-Web Kitchen Saw, strong and durable.....	.65
One Butcher and Carving Knife, extra guaranteed.....	.50
One Carving and Flesh Fork, handsome and guaranteed	.50
One Can Opener, small but powerful, guaranteed.....	.25
One Paring and Peeling Knife, razor edge, guaranteed,	.15
One Imported Aluminum Diamond Sharpening Stone..$	.25
Total value of above at retail	$3.45
One year's subscription to Maritime Farmer (in advance)	.80
Total value	$4.25

All of these articles for $2.50

This offer applies to either New or Renewal Subscriptions. Neither article can be purchased Separately.

Live Agents Wanted in Unrepresented Territory.

THE MARITIME FARMER, - Sussex, New Brunswick

YOU Can Furnish Your Home FREE!

ANY housewife buying goods at the stores mentioned below may have their cash purchases apply on **Asepto Soap Premiums.** Every cent you spend counts toward a premium. A sure and mighty convenient way to save without increasing living expenses. Over 300 premiums of honest value to select from. The list will be increased every few weeks. Furniture will be offered next. The old way was to allow premiums to apply on Soap Wrappers only. Now at any of these stores—no matter what you buy—everything has its equivalent in Soap Wrappers. That is every five cents spent counts the same as one wrapper, while purchases of our goods as here advertised entitles you to two coupons—the one the merchant allows and the ones found in or on our goods themselves.

Dr. White's Honey Balm.—A cough syrup that is safe and sure. We are positive that no other cough syrup equals it. Price 25c. Equal to 5 soap wrappers.

Pendleton's Panacea.—The best hot medicine, in use nearly 100 years. Every person knows it is good. Price 25. Equal to 5 soap wrappers.

Brown's Cutilive.—A witch-azel cream for chapped hands, sunburn, etc. Price 25c. Equals 5 soap wrappers.

Scott's.—Salts, Senna, Sulphur, Saltpetre, Borax and Alum in 5c packages. Equal to 1 soap wrapper.

Brown's Spearmint Tooth Paste—Sweetens the breath, prevents decay, hardens the gums and whitens the teeth. Price 25c. Equals 5 soap wrappers.

Napatho Soap.—A pure laundry soap, containing naptha and incorporated by a process that prevents it from hurting the hands, as other Napatho Soaps do. The wrappers count for Premiums.

Sapid Tea.—A blend selling at 40c, in 1 lb. packages only. Blended by J. Harvey Brown, one of the most competent tea men in Canada. Each package carries a coupon equal to 8 soap wrappers.

Dr. Scott's White Liniment.—The largest bottle and best liniment. Price 25c. Equal to 5 soap wrappers.

Banner Flavoring Extracts.—All flavors and from 10c to $1.25 per bottle. Coupon on each bottle.

Herner's Dyspepsia Cure.—The only kind that tells you to eat what you like while taking it. Money back if not good. Price 35c. Equal to 7 soap wrappers. Price $1.00. Equal to 20 soap wrappers.

Brown's Stomach and Liver Pills.—A good family pill. Price 25c. Equals 5 soap wrappers.

Scott's Furniture Polish.—Renews the life of old furniture. Price 25c. Equals 5 soap wrappers.

Asepto Soap.—Is equal to the best and contains the same anti septic features that Asepto Soap Powder does. The wrappers count for premiums.

Scott's.—Nitre, Glycerine, Iodine, Iron, Squills, Friar's Balsam, Carbolated Oil, Camphorated Oil, Castor Oil, Sweet Oil, Oil of Tar, Sewing Machine Oil, Spirits of Camphor. Price 10c per bottle. Equal to 2 soap wrappers.

Scott's Fruit Syrups and Lime Juice.—Pure and excellent flavor. 10c, 15c and 25c. Coupon on the bottle.

Ebony Polishes—None better, bothpaste and lustre. Coupon on each box. Try them.

Banner Spices.—In packages only. Absolutely pure. ¼ lb. packages carry coupon equal to 2 soap wrappers.

Venus Floating Soap.—Made from pure vegetable oils and unexcelled for the toilet and bath. Price 25c. Coupon counts for premiums.

Asepto Soap Powder.—Has been the greatest success of any soap or powder ever put on the market. This is the best evidence of its quality. It is antiseptic as well. It absolutely sterilizes every article washed. Think what this means to a family. Price 5c, and the trade mark counts for premiums.

The following stores are now in a position to explain to you what this offer means :—**McLeod & Spence, Port Elgin, N. B.; F. L. Rayworth, Bayfield, N. B.; W. H. ALFALFA.

Alfalfa—Root and Branch.

If you prepare your soil and seed properly you can grow from three to four crops per year, yielding at least $100 per acre in feeding value Are you going to give it a trial?

Feeding value of Alfalfa Hay as compared with other feeds. This shows what a ton of each is worth comparatively for feed.

Alfalfa Hay,	per ton,	21,66=20,16
Clover Hay,	do	14.12
Timothy Hay,	do	9 80
Wheat Bran,	do	24.50=22,80
Shelled Corn,	do	20.16

—N. S. Bulletin, No. 339.

THE enthusiasm in Alfalfa growing that is being manifested by readers of **The Maritime Farmer** since the inauguration of our campaign, "How can Alfalfa Growing receive a Boost in the Maritime Provinces?" is simply marvelous. From every part of the Maritime Provinces we hear that farmers are going to give it a trial. We want to assist further and are, therefore, offering a one pound package of Alfalfa Seed to anyone who will send us one new cash-in-advance subscriber at 80 cents the year. Or if you can send us two new cash-in-advance subscribers we will send you as well a bottle of Nitro-Culture. Will you make an effort to get one or other, or both?

A FEW ALFALFA DON'TS.

1. Don't fail to provide for ample inoculation, soil from an old Alfalfa field is best.
2. Don't sow poor or weedy seed.
3. Don't sow on a weedy soil.
4. Don't sow on any but a sweet limed soil.
5. Don't sow on poorly drained soil.
6. Dont sow on any but a finely prepared, well settled seed bed.
7. Don't pasture the first or second year.
8. Don't lose the leaves; they constitute the best part of the hay.
9. Don't seed a large acreage to begin with. Experiment on a small acreage first.
10. **Don't give up.** Many prominent Alfalfa growers finally succeeded only after many failures.

Lime and Its Effect on Soil and Plant.

Its Use and Abuse.

Direct and Indirect Fertilizers.

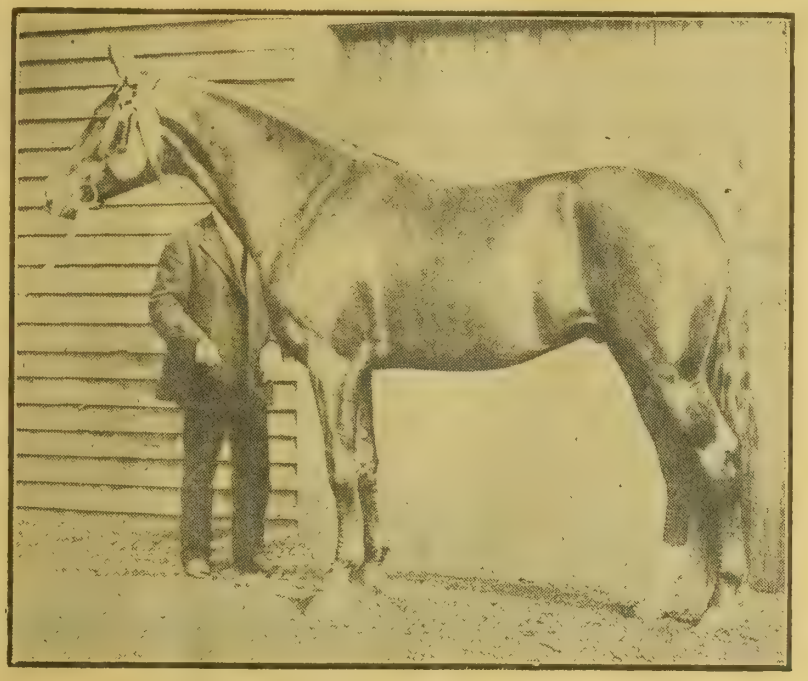
THE three principal constituents of a complete fertilizer are Nitrogen, Phosphoric Acid and Potash in varying proportions. A fertilizer of this kind adds plant food to the soil and may be called a direct fertilizer.

A fertilizer which does not furnish either Nitrogen, Phosphoric Acid, or Potash, but which nevertheless, increases productiveness because of some chemical or physical effect upon the soil, or upon some of the constituents of the soil, is an indirect fertilizer. In this connection attention may be called to the fact that many of the direct manures and fertilizers also exert indirect beneficial influences.

THE MOST IMPORTANT INDIRECT FERTILIZERS are lime in its various forms, marl, land plaster, common salt, and Sulphate of Magnesia. Numerous other materials such as Sulphate of Iron and coal ashes might be added to this list but they are of very little importance.

LIME.—One of the elements, useful for plant growth is Calcium, a solid which can be easily burned. As it burns it unites with oxygen forming lime. Lime is composed of one part Calcium to one part Oxygen. It is in the lime form that Calcium is important in agriculture. As in the case with Potash, however, uncombined lime would burn and injure the plant tissues as it burns the skin. Lime, therefore, like Potash, must be combined with an acid before plants can take it up. The most useful salts of lime are Sulphate of Lime (land plaster), Phosphate of Lime, and Nitrate of Lime. These salts must be dissolved and taken out of the soil by the roots. The quality of lime in most plants is large, but lime being found in quite large amounts in practically all soils, it is seldom necessary to apply salts of lime to the soil as a direct source of food for the plant. There are many soils to which an application of lime in some form is essential, but this is not in most cases because the plant cannot find as much lime in the soil as it actually needs, but because the lime improves the general condition of the soil.

The application of lime in any of its various forms is commonly beneficial rather because of some special effect or effects upon the soil than for the reason that it supplies a deficient element which the plant must take up as a food. Frequently soils are found, which although tilled with the utmost care and supplied with liberal amounts of th? ordinary manures and fertilizers, are yet very unproductive. This may be the case even when the field is not apparently in special need of drainage, although it must be admitted that in many instances it will be found that insufficient drainage has been an important factor in producing the existing conditions which are unfavorable to fertility. Experiments conducted on such soils have shown that the application of lime in some form has often proved highly beneficial. How best to determine whether soils will probably be benefitted by liming is a most important question for our Maritime Province farmers. Before delving into this problem it is well to consider, first the effect of lime on plants, and second the effect of lime upon the soil.



King Dodds.

Champion Standard Bred Stallion at the 1910 and 1911 Maritime Horse Shows, also winner of first prize for Roadster Stallion in harness. King Dodds is owned by Mr. Dodd Dwyer, Pictou, N. S., who must feel rather chesty when he considers that he imported King Dodds' dam and bred, raised and developed this handsome horse. While King Dodds was being shown for the sweepstakes prize, Kaintuck, Grace Abbott's handsome colt, was shown by his side to show that he is a sire of high class colts. There are many first class King Dodds' colts in and around the town of Pictou.

THE EFFECT OF LIME ON THE PLANT.

1. Lime is absolutely necessary as shown by the fact that, if it be not supplied, the growth of the plant ceases as soon as it has made use of the small amount of lime contained in the seed.

2. The amount of lime in plants depends upon the quality in the soil. No plant can develop without a certain minimum quality, but if lime be abundant in soil the plant takes more than this minimum, and within certain limits the more abundant lime is in the soil the larger is the percentage of lime in the plant. Fodder grown upon a soil rich in lime contains a larger quantity of that element than fodder of the same kind grown upon a soil poorer in lime, and the fodder richer in lime is better food, especially for growing animals than is that which contain less lime. Limestone regions are generally noted for fine stock.

3. The form of the plant differs with the amount of lime in the soil. The experienced eye recognizes at once whether the soil is rich or poor in lime by the growth of the crop. On soil rich in lime the plant is compact, short jointed, stouter in stem, and the general development far mare luxuriant than in soils poor in lime. In the soil rich in lime, moreover, the plants incline to far greater fruitfulness. Plants on soil poor in lime are long-jointed, slender and comparatively feeble. They may blossom abundantly but produce little seed. Grains and grasses on soils poor in lime, because of their more slender form, are far more likely to lodge than on soils rich in lime.

4. Different plants require different amounts of lime in the soil The various species of plants differ extremely in respect to the amount of lime required in the soil for good growth. Most of the plants belonging to the clover family require large amounts of lime in the soil. Peas, beans, vetches, clovers of all kinds and alfalfa require abundant lime. The cereal grains, and in short all grasses, require less lime. Most of the latter will do better with abundant lime but they can nevertheless perfect themselves if comparatively little be present in the soil. If the soil on which a variety of plants is growing be limed, the effect upon the relative number of the different species is very marked. Thus, if a portion of a field in which the soil is not naturally rich in lime receive an application of this material while another portion is left without lime and then a mixtdre of grass and clover seed be sown, it will appear after the seeds are well started as though clover had been sown on the limed part of the field and grass on the unlimed part. The difference will be more marked if some Nitrate of Soda be applied. This will help the grass greatly but will not particularly benefit the clover. The character of the seed sown for ingrowing is not the only factor which influences the character of the growth. The chemical condition of the soil determines in a large measure which species will thrive. Clover and timothy will start well if the soil is well stocked with lime, while red top may predominate if this is not the case. Professor Wheeler of the Rhode Island Experiment Station, has made extensive experiments to determine the relative need of lime by different crops. He has published lists of crops respectively benefited and injured by liming. Following are a few of the most important.

BENEFITED BY LIMING.—Beets, Cabbage, Turnips, Barley, Buckwheat, Oats, Carrots, Onions, Strawberries, Timothy, Clover.

USUALLY INJURED BY LIMING.—Millet, Redtop, Blackberries. A number of investigators have found that potatoes following too closely after an application of lime are likely to be scabby. It has also been found that corn is less benefited by liming than the other grains.

THE EFFECT OF LIME UPON THE SOIL.

The beneficial effect of lime are usually due to some special action on the soil. The effects which may follow a heavy application of lime are

numerous. They are best considered under two heads: Chemical Changes, and Mechanical Changes. Under the first head are included changes which render plant food more available; under the second, changes which bring the soil into more favorable relations with water, air, etc.

CHEMICAL EFFECTS. — Lime renders the potash of the soil more available. A large part of the potash of our soils is present in comparatively insoluble silicates. Lime may decompose soil silicates, setting the potash in them free and thus greatly increasing its availability. Experiments have proven that when lime is applied to a soil originally poor in this constituent the plant is not only richer in lime but also in potash. The use of lime may, then, for a time, have a similar effect to that of potash-contained manures, but it must be remembered that the lime does not supply potash— it simply renders the potash in the soil more available and if the store of potash naturally present in the soil is small it will need liberal potash manuring all the sooner because of liming.

2. The presence of sufficient lime in the soil prevents the soluble phosphoric acid applied in fertilizers from satisfying its hunger for a base by combining with iron or alumina, which is undesirable because phosphates of iron and alumina are very insoluble. When lime is present the phosphoric acid will take this by preference and the reverted phosphate thus formed is much more valuable than would be the phosphate above mentioned.

3. Lime promotes the decomposition of organic substances—humus, sod, stubble, etc.—and thus hastens the time when the valuable constituents of these materials are ready for the use of the next crop. This effect of lime is particularly valuable on the heavy, moist soils in which organic matter naturally decays slowly.

4. Lime favors the change of ammonia into Nitric Acid, that is, it makes ammonia nitrogen more quickly available. Where Sulphate of Ammonia is used as a fertilizer, the nitrogen in it must be acted upon by nitric acid ferments before the nitrogen becomes available for plant food. The action of these bacteria appears to be greatly favored by the presence of abundance of lime or other alkalies in the soil.

5. Soils needing lime often contain free acid. Such soils are sour. Lime is the most effective agent which can be used to sweeten such soils. It is the heavier or poorly drained soils, those rich in humus, those imperfectly worked and aerated and those on which such fertilizers as Kainite and Muriate of Potash have been largely and continuously used, which are more likely to become sour and on such soils lime may be used with favorable results.

6. Soils sometimes contain injurious compounds of iron and these may be rendered harmless by the free use of lime.

MECHANICAL EFFECT OF LIME.

Lime makes soil more mellow. On working, on the one hand, a soil poor in lime, or, on the other hand, one rich in lime, it will be noticed that the two soils behape very differently. The loam which contains little lime is made fine only with great difficulty. It adheres to all the implements used in it. A loam rich in lime crumbles far more easily. It is readily brought into good tilth, it does not adhere to such an extent to the implements used in it. If loam containing much lime is exposed to the action of frosts the influence is highly beneficial. It becomes more mellow. Loam poor in lime, on the other hand, is not benefited to nearly the same extent. Loam of this kind turns up in tenacious clods. On lying undisturbed in spring or summer it forms a hard crust. Soil rich in lime crumbles on being turned over by the plow. If rich in clay and moist, it may be somewhat lumpy when turned but these lumps are not tough, they are readily broken. An open porous soil allows water to penetrate quickly. Surplus water passes into the subsoil. Soil poor in lime and rich in clay is very impervious to water and after a heavy rainfall remains wet too long. The air cannot penetrate a soil of this character and the absence of sufficient air as well as the stagnant water is injurious. As the result of an experiment it is reported that a layer of water about two inches thick required 26 days and 19 hours to pass through the clayey soil. After the soil was mixed with 2.5 per cent. of lime the same quantity of water passed through in 7 hours. The explanation of this remarkable effect of mixing lime with clayey soils is that it causes the exceedingly fine particles to gather in little balls.

Between these little balls of clay, air and water circulate as between grains of sand, and it is to this particular effect chiefly that the great improvement in the heavy soils resulting from this liming is due. Certain fertilizers, among which Kainite, Muriate of Potash. and Nitrate of Soda may be named, when freely used make the soils compact and increase the tendency to formation of a crust at the surface. If such a crust be broken up by cultivation or hoeing, it forms after the next rain. It is practically impossible. under these circumstances to keep the soil in suitable tilth. The use of lime in connection with such fertilizers will prove an effectual preventative of crust formation. In European agriculture air-slaked lime is generally employed in connection with Nitrate of Soda or Potash salts.

Baron Majestic.

Champion Clydesdale Stallion at the Maritime Horse Show.

Bred, owned and exhibited by Messrs C. R. H. Starr & Son, Port Williams, N. S. Sold after the fairto Mr. H A. Moffatt, North Sydney, N. S.

ON WHAT SOILS WILL APPLICATION OF LIME PROVE BENEFICIAL ?

There are three leading methods which may be followed in attempting to determine whether the soil of a given locality or the soil of a particular field needs lime. These are: 1. Chemical analysis; 2. A study of the natural indications; 3. Special tests and experiments.

1. CHEMICAL ANALYSIS.—It is held by some authorities that every soil should contain at least 0.2 to 0.3 per cent. of lime. If chemical analysis shows a soil to contain less than the lower of these percentages, liming is believed to be called for. It is not denied that soils containing somewhat less than .2 per cent. of lime may give good crops of certain kinds, but simply that if they have less than this they will give uncertain results with some crops; as for example, clovers. It is not the belief of the writer, however, that chemical analysis to determine whether lime is called for will usually be necessary.

2. NATURAL INDICATIONS. — The best natural indication as to whether lime is probably needed is afforded by the character of the spontaneous vegetation. Plants need very different amounts of lime. We have lime-loving and lime-hating plants. Among the former are vetches, red and other clovers, and when these are naturally abundant in grass lands lime is probably not required. Among trees the oak, beach and locusts are lime-lovers, and when these grow spontaneously and attain good size in a neighborhood it is an indication that the soil is rich in lime. On the other hand, sorrel is one of the commonest of those plants which thrive where there is little lime. It should not be concluded that where we see only here and there a few plants of sorrel lime is required, but simply that where this plant tends to come into mowings, crowding out the grass and clover and making the fields in June actually red, lime is almost certainly needed.

3. SPECIAL TESTS AND EXPERIMENTS.—The use of litmus paper. Take a small sample of moist soil from the field and without touching the paper with the fingers place a piece of blue litmus paper on the soil. If the soil contains much free acid or is sour this paper will quickly turn red, and when this is the resdlt of such tests the soil will almost certainly be benefited by liming.

The ammonia test. Put a few drops of common ammonia water in a glass holding about a teacup of pure water. Into this stir a teaspoonful of the soil to be tested. If the soil contains any considerable excess of carbonate of lime or magnesia of water standing above the soil after it has settled and stood for a few hours will be clear. If the soil needs lime, on the other hand, it will have a darker, reddish brown or black appearance, the depth of the color depending upon the amount of soil taken and its need of lime. This change in the color of the water is due to the formation of a compound of ammonia and some of the acids in the soil.

For experimental test, select two small plots of land in a part of a field which is apparently uniform in the character of its soil, leaving between the two a strip of land a few feet in width. A convenient size for the plots, according to Wheeler, is 13½ by 27 feet. To one of the plots apply, says Wheeler, 41 pounds of lime, which is at the rate of 2½ tons per acre. This should be thoroughly mixed with the soil. Next apply an equal amount of fertilizer containing all the ordinary elements of plant food to each plot, and plant both. One of the best crops for this use is the beet, and an equal quantity of seed should be planted on each plot. The seed will generally germinate equally well on both plots but if the soil needs lime many of the plants will die very young on the plot to which no lime has been applied, while the other will make a good growth. This method of determining whether a soil is in need of liming is doubtless the safest which can be employed. Other crops selected from the list of those usually benefited by liming may of course be used in this experiment if preferred.

Model Performer

Champion Hackney Stallion at the 1911 Maritime Horse Show

Owned by Mr. R. A. Snowball, Chatham, N. B.

FERTILIZRRS WHICH MAY BE USED TO SUPPLY LIME.

1. SUPERPHOSPHATES contain considerable land plaster, which is a

salt of lime. These may be useful as a source of lime when that element is needed as plant food, and the plaster in them may have some of the chemical and physical effects produced by lime; but it will not be effective in sweetening sour soils.

2. NATURAL PHOSPHATES.—All the natural phosphates, including bone in the various forms and the fine ground rock phosphates, contain a great deal of lime in combination with phosphoric acid as three-lime phosphates, which are insoluable but slowly made available. The application of such phosphates may lessen the acidity of the soil because a part of the soil acids may combine with a portion of the lime, thus becoming harmless. Such phosphates, therefore, may help to sweeten sour soils, but they cannot produce the other useful effects of liming.

3. BASIC SLAG contains a large amount of lime in the four-lime phosphate forms. A portion of this lime may combine with the soil acids, thus helping to sweeten sour soils.

4. WOOD ASHES.—These commonly contain about 35 per cent. of lime together with considerable magnesia and potash. All these elements may be useful in helping to sweeten sour soil, and they will have, to a considerable degree, beneficial chemical and physical effects on all soils which are rich in humus. which they will help to disintegrate, and for those which may be sour, which they will help to sweeten. At current prices the lime in wood ashes costs more than lime in some other forms.

5. LEACHED WOOD ASHES.—Such ashes contain relatively less potash and more lime than unleached, and they may be fairly effective for most of the purposes for which lime is employed.

6. LIMEKILN ASHES.—If wood is the fuel employed in burning lime, such ashes, which will contain relatively more lime than common ashes, may prove very useful for application to soils which need liming.

7. GAS HOUSE LIME AND DYE HOUSE LIME. Lime which has been used in gas or dye houses is commonly wet and difficult to spread. Owing to the large amount of water they contain, transportation costs heavily in proportion to value. Gas house lime requires exposure to air before being used, as it often contains harmful compounds. These forms of lime are less effective than the lime in ashes and in many other substances. They can be used to advantage only near the places of production.

8. FINE-GROUND LIMESTONE OR OYSTER SHELLS.—Lime in these forms, if obtainable at low cost and very finely ground, may prove useful. They are most effective upon the lighter soils but are not equal to burnt lime upon the heavier soils.

9. LAND PLASTER is sulphate of lime. It is manufactured from the mineral gypsum which is simply ground fine, to fit it for agricultural use. Plaster is not equally beneficial with quicklime or air-slaked lime for the sweetening of sor soils but it may have most of the other effects of lime, as has been pointed out in Section (1).

10. MARL contains a large proportion of carbonate of lime. This is the same compound which is formed in air-slaked lime and the application of Marl has very similar effects to those which follow the use of air-slaked lime. The clay usually mixed with the carbonate of lime, moreover, will in itself benefit the lighter soils. When these soils, therefore, need liming, Marl, if it can be readily obtained, should be employed.

11. QUICK OR BURNT LIME is the form of lime used by builders, but as put up in casks for builders' use the cost is relatively high. It should, if possible, be obtained direct from the producers or wholesalers. In putting up lime for builders' use the burnt lime as it leaves the kiln is handled with forks. All pieces which will lie on the fork are put into the casks but the fine lime and the pieces small enough to pass between the tines, since they will slake within a short time, are not regarded as suitable for builders' use. Such fine lime is designated "forked lime" and if this can be obtained resonably fresh it is excellently adopted for farmers' use. It is sometimes practically all quicklime and will slake as perfectly as builders' lime. The price at which forked lime can be obtained makes it particularly desirable. Quicklime acts more energetically than any other forms and is the best kind of lime for soil improvement. It should be slacked either by exposure to air and weather or, better, with water; and after slaking it should be immediately spread. After lime has been slacked it will be found best to allow it to stand for one or two days and it is advisable to screen it for the removal of lumps before application. Care should be taken in slaking not to use water in too large quantities lest it become pasty, in which form it cannot be spread. The quantity of water required cannot be definitely stated since different samples of lime vary. As a rule from two to two and one-half pails is enough for a cask.

12. AIR-SLACKED LIME.—This is produced when quicklime is long exposed to damp air. It can often be purchased at limekilns, being produced by the action of the air on the fine lime, which has been described in Section 11. It can also sometimes be purchased from dealers or builders who have had it slake while in storage. Air-slaked lime often contains some lumps of imperfectly slaked lime, or, when bought from limekilns, pieces of imperfectly burnt lime. Before purchasing it should be understood that the last should be screened out as they would have no value to the farmer. Lumps of the burnt lime should be screened out before applying air-slaked lime because should seed come in contact with them in the soil, where they would take up moisture and slake, its vitality would be destroyed. If, however, such lime can be applied some time before planting the seed and the soil is thoroughly harrowed after the lumps have had time to slake, screening will be unnecessary. The air-slaked lime which has been long exposed to the air is in the form of carbonate and its action upon the soil is less effective than that of freshly slaked burnt lime. If this form of lime is employed larger quantities are required than of burnt lime.

13. LIME WHICH CONTAINS MAGNESIA.—Quicklime, air-slacked lime, etc., sometimes contains considerable quantities of Magnesia in the form of Carbonate. Such lime is nearly if not quite as effective as that which is more pure. There need be no fear that Magnesia will injure either crop or soil.

SEASON FOR APPLYING LIME.

Since the benefits of liming are mainly due to some special effect upon the soil, it will be found best to apply the lime some little time before the field is to be planted. The autumn is in most cases the best season although early spring will answer. If manure or fertilizer containing ammonia or organic nitrogen is to be used in connection with lime, the latter should be put on and mixed with the soil by plowing or deep harrowing before the manure or fertilizer is applied. If either of these should be spread first and lime should be later applied in such a way as to come into contact with them, there would be loss of ammonia. The crop which is to follow, as well as the time of year, should be considered. Lime should by preference be applied first berore one of those crops which have been mentioned as particularly benefited by it is to occupy the land. Liming should not immediately precede a crop of potatoes or sugar beets. Lime is especially beneficial just before a crop belonging to the Leguminosae, such as clovers, alfalfa, peas and beans.

Necitas.

Caampion Thoroughbred mare at the 1911 Maritime Horse Show.
Owned by Mr. G. W. Fowler, Sussex, N.B.

QUANTITY OF LIME TO BE USED.

Lime is applied in widely varying amounts from a few hundred pounds to several tons. Less than one ton to the acre of quicklime will commonly not be sufficient to effect much improvement if the soil is sour or for any other reason stands much in need of liming. Smaller quantities will answer for light soils than for the heavy ones. For the lighter soils 1000 to 3000 pounds per acre is the usual range. If the air-slacked lime is used it should be employed in from and one-half to two times the above amount.

FREQUENCY OF APPLICATION.

If the lime be used in such quantities as have just been named, it is unlikely that an application will be required oftener than once in from five to seven years. Soils which have long been neglected may at first be benefited by more frequent liming.

METHOD OF APPLYING.

In most cases it will be found best to plow the land, then to spread the lime as evenly as possible broadcast, and to work it in deeply with disc or other deep working harrow. On old grass land on which there is an abundant growth of moss it is sometimes regarded as best to spread a part of the lime before plowing in order to secure more energetic action upon the vegetable matter. Lime can be spread by the use of a shovel from cart or wagon but the work is disagreeable on account of the large amount of fine lime which fills the air. Lime-spreading machines have been so far perfected that they do very good work. The tendency of the lime to fly into the air can be in a large measure prevented by attaching an apron of burlap, which should reach the ground, to the back of the spreading machine.

A Magnificent Four in Hand.

The property of Logan Bros., Amherst Point, N. S.

This beautiful four-in-hand composed of pure bred Clydesdale mares was one of the interesting features at the 1911 Maritime Horse Show.

Spring Pasturing.

As soon as the warm days of spring come, many farmers are tempted to over-pasture their cows, especially where there is too much clover, or the cows are turned into a field covered with a catch-crop of rye. This is the time to look out for bloating. Cows that are given free access to rye or clover, especially early in the season, before their systems have experienced the change from dry to green feed, will bloat, often with fatal results.

Cows that have been fed regularly during the winter on silage and roots are in better condition to turn out to pasture than cows that have been fed nothing but dry hay and grain. The change from dry feeding the good of the cows. Better to let to green pastures is too abrupt for them out an hour or two for the first two or three days before giving them the freedom of the pastures.—Maine Farmer.

THE DIPPING OF SHEEP.

The strongest argument for the dipping of sheep lies in the fact that it is the best way of freeing them from external parasites. This is so generally accepted that it is only necessary to mention it. Sheep are very frequently troubled with red lice which can hardly be seen, and yet they cause the sheep unlimited annoyance. Dipping will completely destroy these. Ticks cause the farm flocks of this country untold annoyance, and for these dipping is thoroughly effective. Ticks and red lice do more damage than we are aware of, because the evidences of the annoyance that they give the sheep are not so marked as in some other troubles, but they are none the less a severe check to their well-doing. Dipping, followed faithfully each year, will completely remove the baneful results from the presence of these parasites. For the eradication of scab, thorough dipping stands first among remedial measures.

While the destruction of these pests is usually the mainly accepted argument for dipping, yet there are others that, grouped together, make a more favorable indorsement for the operation. Among these may be briefly mentioned cleansing the skin, cleaning the wool, and, particularly, encouraging the best growth of the latter. To get the fullest returns in these directions, the dipping should be done twice each year—in the spring shortly after shearing, and again in the fall just before the advent of winter.

Shortly after shearing it is an advantage to dip the flock thoroughly so as to cleanse the skin. This does not only add to the thrift of the sheep and the lambs, but in all instances it favors the growth of wool and secretion of yolk. Not only is the growth of wool better from it, but it adds indirectly to the function of the fleece as a protection to the sheep. The fleece of a sheep that has been dipped is more likely to remain intact throughout the season, as there is no cause for the sheep rubbing or otherwise breaking the compactness of it. Another advantage to the fleece that seems to follow dipping at this time is that it seems to lessen the tendency for the sheep to lose their wool in spots, too early in the season. When the fleece is clean and heathy it seems to continue growing longer and the wool does not peel in patches.

Dipping in the fall is more for the purpose of removing from the fleece such foreign matter as may have been gathered during the summer, and also freeing it from any of the parasites that prove such an annoyance during the winter season. Even under the best conditions the fleece is likely to become filled with sand and other foreign matter, which during the winter would produce such irritation as causes the sheep to rub against sharp surfaces and destroy the compactness of the fleece. By dipping them late in the fall when the ground is frozen, and then keeping them away from the straw racks, feeding them in racks that prevent the chaff from falling into the wool, it is possible to put a clip on the market in the spring just as clean as if the sheep had been washed previous to being shorn.

While the foregoing applies especially to breeding flocks, there are just as forcible reasons for dipping feeders. In feeding sheep it is of prime importance to have them reach as rapidly as possible that sappy and thrifty condition which is conducive to good gains. Dipping will hasten this, and it also removes the risk of unlimited losses through an outbreak of scab. It is good policy to take it for granted that the feeders are in need of dipping, rather than wait for the evidences of it, which usually come when the sheep should go to market.

TIME FOR SEED-TESTING.

The farmer who, in these days, sows his seed without testing the germinating power of the seed, enters into a gamble with Fortune, in which there is a fair chance that he may come out a loser. Scientific farming means the substitution of certitude for a gamble—the elimination of chance, and the planting of seed with a moral certainty that a crop will follow.

Among the in-door activities to which the weather will invite between now and seed-time, none may more fitly occupy the farmer than the careful selection and testing of the seed for the prospective "crop of 1911." Done now, the work may receive an amount of attention which it may be impracticable to bestow upon it if it is postponed until the rush of work begins in the spring; and the extra care is likely to be reflected in a larger crop.

The man who is to have the best crop of wheat next summer is the one who, among other things, this winter uses his fanning-mill to "sort out" for seed, from the bin where his best wheat is stored, the largest, densest and heaviest kernels, and who then tests their germinating power, lest appearances may be, after all, deceptive. If he finds that only 90 per cent. of his selected kernels germinate, he will add enough seed to the amount he expected to sow, to compensate for the 10 per cent. which will fail to grow. If the germination is below 90 per cent., or the sprouts lack vigor, he will procure other seed rather than risk getting an inferior crop

PLANTING TIME.

"While the earth remaineth, seed time and harvest, and cold and heat, and summer and winter, and day and night shall not cease."

Each returning season reminds us of this wonderful promise that has been kept through the thousands of years since it was given. It is again seed time with us, the winter is passing, and if we are ready for the harvest that shall surely come, we must prepare for planting, and in season plant.

Fruit and shade trees: there is yet ample time to plant fruit and shade trees, and there is nothing that adds more to the comfort and beauty of the home than a liberal planting of both. Fruit should not be a luxury in any home, when there is even small space for trees, it is a necessity for the health of the family. In many of our homes the long, warm summer passes without fruit, the family menu furnishes the small bill of fare as that of the winter, bread, bacon, a few vegetables, probably an occasional chicken, and sometimes even the products of the cow are lacking—when a few fruit trees, a patch of berries and a well cultivated garden would add comfort, pleasure and a decided improvement in health and spirits to the entire family.

The vegetable garden should furnish a large part of the family living in warm weather; there is such a great variety of vegetables, all of which are easily grown in our climate, and requiring comparatively little time, and effort, that the head of the household is derelict in his duty when he does not provide vegetables in abundance.

When the orchard and garden are attended to, some time should be given the culture of flowers for their refining influence, for no one can live among flowers, minister to their needs, watch them come into bloom and not be made happier. This is especially true of children. Children brought up to love flowers, to grow them, to know them as they know friends and family, feel the influence of their beauty and fragrance through life.

Memory binds the heart of the wanderer to childhood's home more than any other, except the natural tie, and how often just the sight or the odor of a blossom will take one back, far back, to some scene of the old home, a beneficent and refreshing memory.

Give the children flower seed, or vegetable seed, teach them how to cultivate them. and encourage them to care for them in a way to get best results. The care of a little garden—a child's very own—will give children pleasant employment many an hour when they otherwise might be discontented and unhappy.

A COAT OF PAINT.

It is extraordinary what a coat of paint will do both in hiding defects and assisting the preservation of woodwork, and an able assistant in these matters is a piece of putty. We do not, of course, write this paragraph purely and simply for the purpose of making the above statement, but rather as a reminder that at this time of the year there are days when the weather is bad, outdoor work is impossible, and it is not an easy matter to find occupation for men who want their money on Saturday night. Just so, but what about the farm implements? Are they all clean and in the pink of condition? Let every farmer answer the question for himself, but implements cost money and are worth looking after. He is a poor man, indeed, who cannot at a pinch handle a paint brush and a worse still who cannot clean up an implement ready for the painter. Paint does not cost much, neithor does the putty, which is capital for filling up crevices in woodwork, and after the overhauling an implement not only looks pounds the better, but it will last longer and save over and over again the value of the time spent in doing it up.

REPAIR THE FENCES.

Before turning live stock out to pasture, see that the fences are properly repaired. A fence is no better than its weakest point. All classes of live stock are inclined to be a little curious. As a rule, when they are first turned out to pasture, they will start on a tour of inspection all along the fences. If they find a weak spot where they can break through, while they are on this tour of inspection, they will be looking for similar advantages all through the season and will cause no end of trouble. If they fail in their first attempt they settle down to feeding, and, as a rule, there will be no further trouble with breachy animals.

How Can Alfalfa Growing Receive a Boost in the Maritime Provinces?

Alfalfa, its Uses and How to Grow it.

It is now generally conceded that alfalfa has been grown for a longer period than any forage plant now in common use. It is a perennial and will live for a longer period in the soil than any other plant that has been grown under domesticated conditions. It belongs to the same family as clover, but it exceeds all of the clovers in the rapid growth which it makes; in its ability to stand drought, in the number of the annual cuttings which it produces and in the duration of its existence. Under favorable conditions of growth, it is the first forage crop of high palatability that is ready for such a use, and the number of the cuttings which it produces runs all the way from one to ten each season, dependent upon the favorable character or otherwise of the soil and climate, and also on the abundance of the water supply.

THE USES OF ALFALFA

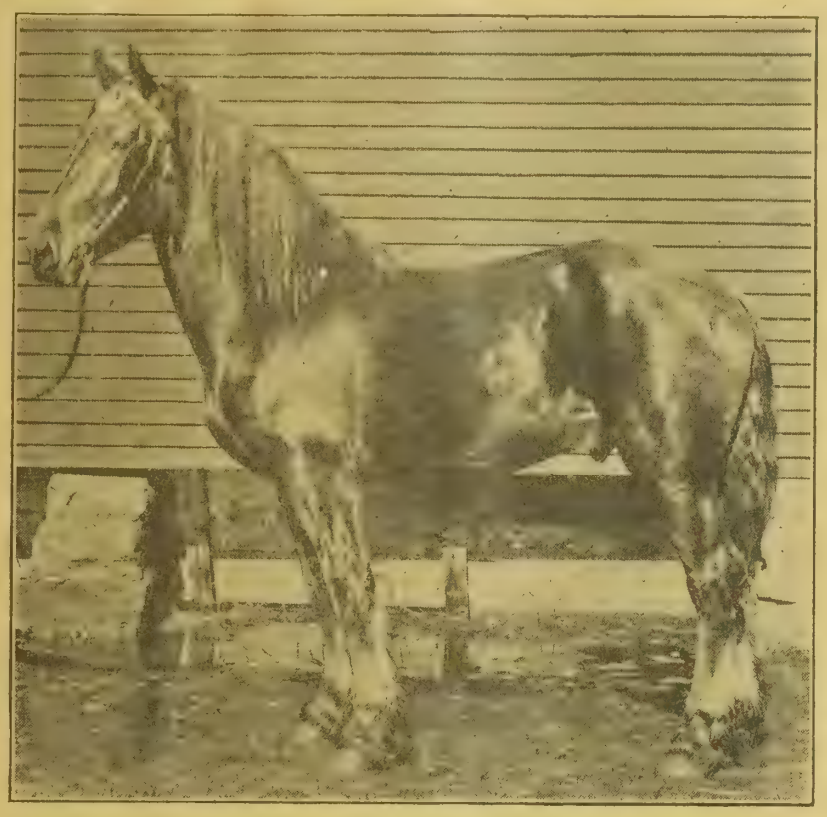
Alfalfa is a useful pasture plant under certain conditions of growth and for some kinds of live stock. It is also an excellent plant to furnish soiling food of a valuable character and during the greater portion of the growing season. But its highest use is in furnishing hay that is unexcelled in its palatibility, in its high nutrition, in the yields that that may be obtained from growing it and in the duration of its production. There are fields of Alfalfa on this continent that have been producing for more than half a century, and the crops that are still reaped from them show no signs of waning. Alfalfa is also a great soil enricher.

DISTRIBUTION OF ALFALFA

Aflalfa is grown with much success in all the continents. On this continent it may be successfully grown from the vicinity of the Arctic circle to the isthmus of Panama, but not on all soils and not under all peculiarities of climate. Generally speaking the soils west of the Mississippi river have shown higher adaptation than the soils east of the same for growing Alfalfa, and the same is true of the soils west of the great lakes rather than those east of them. While of course a long season is more favorable to production than a short one, it is true nevertheless that in many portions of Western Canada, two and even three cuttings of Alfalfa may be obtained in one season. Where moisture is much lacking, however, in some seasons not more than one cutting of the Alfalfa can be obtained. The yields run all the way from one to twelve tons per acre per year. In Western Canada, without irrigation they would probably average about two tons a year, and with irrigation from four to five tons. The northern limit for the growth of the hardier strains of Alfalfa will be about the same as the northern limit for the successful growth of wheat. The indications at the present time would seem to show that for all of Canada west of the great lakes, Alfalfa will be the leading hay crop after a few years go by, and for all time.

SOILS FOR ALFALFA.

Where Alfalfa can be irrigated, the soils with highest adaptation for its growth are sandy loam and porous silty soils such as are so frequently found in the river valleys of the West. Such soils are easily penetrated by the deep roots of the Alfalfa, and they readily carry away drainage water from the same, should it be present in excess. Where Alfalfa cannot be irrigated, the favorite soil conditions where these may be found, are sandy loams underlaid with ground water that does not come up nearer to the surface than say six feet. The Alfalfa plants obtain moisture in dry weather from this subterranean source. But the average loam soils of the grain growing areas of the Western prairie are also well adapted to the growing of Alfalfa, provided they are not underlaid with hardpan or coarse gravel coming up near to the surface, and this will hold true of them even though the ground water should be not less than 500 feet or indeed any distance below the surface. Under these conditions, the best subsoils are such as may be termed mild clays, that is clays that one may dig down into to the depth of a few feet without using the pick at that season of the year when the soil has in it the largest amount of moisture, which would be in May or June in the West. Stiff clays will also grow good crops of Alfalfa, but on these it is more difficult to get a stand and the plants grow less rapidly than on other soils. Low wet land on which the water rises above the surface for any considerable length of time during the year are ill adapted to the growth of this crop, and the same is true of raw peat lands, as these dry out too readily and they are also low in plant food.



A Grade Clydesdale Colt.

Second prize heavy draught three year old colt at the 1911 Maritime Horse Show. Owned by Roper Bros., Charlottetown, P. E. I.

It is true nevertheless that Alfalfa will not grow well on many soils where the plant food may rank high and where the mechanical and moisture conditions may be correct, and for the reason that the Alfalfa bacteria are not present in the soil, which are essential to the growth of the plant. These minute forms of insect life are usually present in abundance in soils such as are found adjacent to the Western mountains and within the valleys of the same, but farther eastward they are frequently absent. Their absence may be known by the behaviour of the plants in the progress of growth. When good seed is properly sown, under favorable weather conditions it will never fail to grow for a time, but if the bacteria are absent it will soon cease to grow. The leaves will lack the deep green tint that characterizes the growth of healthy plants, and if the roots are examined, they will be found lacking in the nodules, that is the little specklike or warty like substances that are always found growing more or less upon the roots of healthy Alfalfa plants. It is a case of hunger, the plants being unable in the absence of these nodules to draw supplies of nitrogen from the air to sustain their growth. They may live for a year or two, but they will not produce crops that are remunerative.

Of the various ways of introducing the bacteria, the following is the best: Secure about 200 pounds of earth from a field where Alfalfa has grown vigorously, preferably for a longer period than one year. Sow the same over each acre of land to be sown to Alfalfa, and preferably just before the Alfalfa has been sown, or it may be drilled in with the seed. The bacteria thus brought to the soil multiply rapidly, and as they do such multiplication is more and more favorable to the growth of Alfalfa. This explains in part at least why Alfalfa may come to produce very large crops annually where at one time the yields were small, and where it may not have been possible to grow the crop. When one good acre of Alfalfa has been thus established, the inoculating material is thus at hand for an entire farm.

PLACE IN THE ROTATION.

As usually grown, it can hardly be said that Alfalfa is a rotation plant, as when once established in the soil it is usually desired to leave it undisturbed by the plow as long as it will produce well. Of course while it thus occupies the land, other crops are excluded from the same. But where it is easy to get a stand of Alfalfa, it may be broken up if desired every few years, as often perhaps as every fourth or fifth or sixth year. It would then become a rotation plant in somewhat long rotations. Where clover will not grow well, and the rotation is of prime importance, where the growth of grain crops in as it usually is on prairie soils, it may be an excellent plan to grow Alfalfa thus. When Alfalfa is sown on irrigated land, it may be given virtually any place in the rotation, for there is really no hazard in securing a stand, but when it is sown on other land, and especially where the rainfall is not always ample, it may be best sown on land summerfallowed or that has grown a cultivated crop, as corn or potatoes. It may be started on breaking that has been plowed early and deep and that has been given good pulverization on the surface, but that is not so good a method of planting the crop as putting it on older land. But, howsoever sown, it ought to be on clean land, as weeds and grass may easily crowd out the plants when they are young. The best crops to follow immediately on Alfalfa sod, are corn, potatoes and flax. On strong lands other grain crops than flax may produce an excess of straw when these are the first crops grown. They come in nicely, however, for the next two or three crops, and the same is true of sugar beets on irrigated lands.

PREPARING THE LAND.

After grain crops the land should usually be summerfallowed, especially under dry conditions, before it is sown to Alfalfa. The object thus sought is to clean the land and also to conserve the moisture necessary to give the Alfalfa a good start the following year. If say ten to fifteen loads of good farmyard manure are applied to the land before the plowing is begun, the influence on the stand of Alfalfa will be very helpful. It has been noticed that the application of manure thus or even as a top dressing, tends greatly to increase in the bacteria so essential to growth in the life of the plant. Such fertilization will be equally helpful, if corn or potatoes are made to precede the Alfalfa. In the spring following, the land should not be plowed again, but simply disked and harrowed so as to make a smooth and fine seed bed on the surface, to the depth of two or three inches, leaving the land firm below the seed bed. Preparation thus careful will much more than pay the cost in the increased production in the Alfalfa, as compared with what would result from preparation less careful.

SOWING THE SEED.

On irrigated land, from twelve to fifteen pounds of seed per acre are uaually enough, (although many successful growers recommend twenty pounds.) On other land where the rainfall is more than fifteen inches per year ten pounds per acre will be ample. Where the rainfall is not more than fifteen inches, eight pounds will be ample. If, under dry conditions, too many plants are present, they will not grow sufficiently to make a good crop. The aim should be to sow the seed with a grain drill burying it to the depth of one to three inches according to the soil and moisture conditions. From one to two inches is deep enough as a rule on ordinary prairie soil. The more dry the weather conditions the more important is it to bury the seed with the drill. Except on sandy lands that blow, the Alfalfa should be sown alone in the absence of irrigation. If sown with a nurse crop under dry conditions, the nurse crop

will take away so much moisture that the plants will be unduly weakened, which will militate against future production. On sandy lands that lift with the wind, a few quarts of grain may be sown to aid in resisting the action of the wind. The best time to sow the Alfalfa should be determined by the time when the killing spring frosts usually cease. Alfalfa plants are easily killed by frost when young. In the Canadian West, late May to middle of June will probably prove the best time for sowing the seed. There is much controversy at the present time with reference to the best strains of seed to sow. While the scientists are trying to settle that point, it may be safely said that the best plan to be followed at the present time is to obtain seed that has been grown far northward, no matter what the strain is. The plants from such seed will stand the cold of Northern winters much better than those from seed grown farther south. The plan is good which cuts off weeds and Alfalfa plants when say six to eight inches high with the mower, if the season is not advanced, but leaving the residue thus mown on the ground. The mower should not cut below the crowns of the plants. The mowing at that stage is good for both root and crown development in the plants. They should then be allowed to make top to aid in carrying them through the winter. In dry areas, when the plants are about four inches high, they may usually be helped in growth by running an adjustable steel harrow over the land. This will destroy many weeds and will aid in conserving moisture.

HARVESTING ALFALFA

In dry areas no crop is usually obtained the year that the seed is sown, but sometimes under irrigation one and even two crops are cut. The best time to cut Alfalfa to make winter food for swine and lambs is when the first buds appear, for milch cows and other cattle when just beginning to bloom freely, and for horses at a stage just a little more advanced. In moist areas the best way to cure Alfalfa is by putting it up in small cocks and curing it like clover. The aid of hay caps may prevent much loss, as Alfalfa is easily injured by rain. The crop should be raked in any case into small winrows as soon as it will rake, to prevent the shedding of the leaves. In dry areas it is frequently lifted from the winrows into small bunches in which it dries. In other instances it is taken from the winrow to the stack by the aid of such machinery as may be on hand. Even though the weather should be moist, cutting should not be long deferred or the loss in the next cutting may be serious. Where irrigation is practised, it is usual to apply water just after each cutting. The intervals between the cuttings is about 30 days. In dry areas and especially northward, the plants should have a growth four inches and upward to protect them on going into the winter.

ALFALFA AS A SOILING FOOD.

Alfalfa has peculiar adaptation as a soiling food, because of the quickness with which it grows, because of the continuity of the growth, and because of its high nutrition and marked palatability. It has special adaptation in providing such food for dairy cows. Where the area is large enough no sooner has the field been cut over once than it can be cut over a second time. Such food is also excellent for swine in the absence of pasture.

ALFALFA AS A PASTURE

Alfalfa may be pastured by horses or swine without any hazard, but there is some hazard that bloat may occur when it is pastured by cattle or sheep. The more dry the climate the less is the degree of such hazard. In many areas it is pastured frequently by cattle and sheep, notwithstanding especially where the crop is much grown. In Western Canada the best use of Alfalfa as a pasture plant when sown alone, will be in providing grazing for swine. But when thus grazed the duration of the life of the plant will be shortened. It will also be found unwise to pasture Alfalfa meadow in the late fall or winter in Northern areas. It may be grown, however, with profit in dry areas, when made one factor in temporary pastures. In such areas the following mixture should make a good temporary pasture:—four pounds each of brome grass, Western rye grass and Alfalfa. On irrigated lands it could be grown with timothy and orchard grass. The advantage from growing it thus would be, first, to add to the pasture product, and second, to take away the element of danger from grazing cattle and sheep on it.

ALFALFA AS A FERTILIZER

Alfalfa is a great soil enricher, that is, in the sense of bringing nitrogen

Consider the Advisability of Your **Fertilizer**

Before you buy Fertilizer, learn what you are going to get out of it. The stuff your crops can't take out is worthless. There is much such nitrogen in most nitrogen fertilizers. There is one form of nitrogen—

Nitrate of Soda

—that has 100% of its nitrogen available: It is the **Cheapest Form of Nitrogen**—also Quickest in effect and Cleanest to handle. Use it as a top dressing or in a complete home-mixed fertilizer. $3.00 worth on an acre of meadow often increases the yield a full ton.

Would such results pay you ? Drop us a card for prices.

to the soil which it takes from the air. It also brings phosphate and potash from the lower soil and subsoil which will come back again in great measure to the surface soils when the Alfalfa is fed on the farm. The humus which it brings to the soil in its roots aids in maintaining the mechanical equilibrium, and in giving increased power to the soil to hold moisture. Furthermore it makes avenues in the decay of its roots which convey water downward into the soil when rain falls that would otherwise run away. This becomes storage water for the next crop. Alfalfa brings these benefits without any cost to the grower.

GROWING ALFALFA SEED

The best methods of growing seed from Alfalfa are not yet mastered. Some seasons a return not much short of $100.00 per acre will be obtained from a seed crop, and the next year a seed crop may be similarly grown on the same land or on other land on the same farm that will give very little return. The season has much influence on the growth of the seed crop. In dry land areas, the first growth, which in many instances is the only growth for the season, furnishes seed if furnished at all. On irrigated land, the seed is more commonly taken from the second crop. The following may be safely stated with reference to growing seed: (1) wet weather is unfavorable to seed production. (2) The same is true of rank growth in the plants. (3) Where seed is grown on irrigated lands, water should be applied sparingly if irrigated at all. It is now thought that seed can be profitably grown in dry areas and under dry conditions, if the plants are sown in rows and cultivated. But this has not been definitely worked out as yet.

FEEDING ALFALFA

When Alfalfa is fed to work horses while at work, a moderate amount only should be fed at first, lest the digestion become too lax. The amount fed to such horses should always be somewhat restricted as in the case of other hay. Less of grain is called for than when feeding other hay. As a food for colts and brood mares, Alfalfa is excellent.

When cattle are being fattened on Alfalfa hay and grain, from 50 to 60 per cent. will suffice of the amount of grain usually fed, and the same is true of such hay when of good quality and fed to dairy cows. One ton of such hay is worth nearly as much as a ton of wheat bran for milk production.

As a hay for sheep, Alfalfa is unsurpassed when of fine growth. It will produce and maintain a larger standard of growth than other forage, and the same reduction may be observed in feeding grain as when the the hay is fed to cattle.

Brood sows may be wintered on Alfalfa hay alone and water, where the winters are not quite severe. Under the latter condition a little grain fed along with the Alfalfa will be equally helpful. The hay is equally suitable for feeding other swine that are being carried through the winter.

NOTE.—On the open prairie, when seeding Alfalfa, we advocate the planting closely together of three or four rows of corn or sunflower at intervals of 20 or 30 yards right across the patch. This when well grown will greatly assist in gathering snow affording needful protection to the young Alfalfa plants during winter and early spring.—Steele Briggs Seed Co.

To Experiment With Alfalfa.

J. B. of Perham, Minn., is going to try to raise alfalfa. He says he notices that we always advise using ground limestone and would like some advise regarding it.

Experience has taught that in limestone regions alfalfa grows very luxuriantly. It has been found also that where alfalfa has failed, a liberal application of ground limestone has made it flourish in the most striking manner. Prof. Wing in his book on "Alfalfa" mentions an experience he had with an eastern farmer. Everything was tried except lime and failures followed until an application of six tons of ground limestone was made. The following season the land produced six tons of cured alfalfa per acre. Such experiences as these have led us to recommend the use of ground limestone on soils lacking in this material.

It is quite possible in the section where our inquirer lives that the soil has abundant supply of lime and does not need it. Limestone is an inexpensive material. If it has to be shipped long distances, however, it is very expensive. Therefore, it becomes quite important that companies should be formed in different parts of the country for the purpose of supplying limestone to farmers with less cost.

It would be well to take a small piece of ground and apply at the rate of two tons of ground limestone per acre and seed it to alfalfa. Observe the results when compared with a piece of land where alfalfa has been sown without an application of the ground limestone. This would determine very quickly whether it would pay to purchase lime for the soil.—Hoard's.

Vanco
LEAD ARSENATE
Is better, in every way, than any other spray for Worms, Codling Moth, Potato Bugs, Asparagus Beetle and other leaf-eating insects.
VANCO sprays easier, sticks to the leaves better, does not burn the foliage, and always kills the insects. Contains guaranteed amount of Arsenic Oxide — of uniform strength and highest quality.
CHEMICAL LABORATORIES LIMITED
VANCO
It is made in Canada. This means no duty to pay, lowest prices, lower freight from a HOME industry.
Our book on Spraying is free. Write for a copy.
FERTILIZERS
We also sell Nitrate of Soda, Muriate of Potash, Sulphate of Potash and Acid Phosphate.

Top-Grafting Apple Trees.

All of us have often seen growing near the house or in the yard apple trees whose lives would be endangered were their records for fruit-bearing investigated. Very often they are healthy thrifty-looking trees in the best of condition so far as wood growth is concerned. In most of these cases there is no reason other than the owner for this unfruitful condition. Simple operations in top grafting would be the cause of such barren trees becoming fruitful and useful as well as ornamental.

Almost any man or boy with the slightest degree of ingenuity and dexterity can saw off a limb, split the stub and slip in a couple of scions, twigs cut from some good apple tree. It may be a rough job, but you will be surprised at the feeling of pleasure experienced when you see the little twigs begin to grow, and later to blossom and bear fruit. The process of top grafting is not so difficult to understand and to perform as the average person thinks. First, go to some apple tree, which you know is a good bearer and of good variety, and cut your scions. Scions are twigs from last year's growth. It is quite practicable to graft several varieties to one tree. Trees have been seen bearing seven or eight different kinds of apples at one time. You may have to get your scions from some neighbor.

The scions should be cut before the growth starts in the spring, or preferably in the fall, as the buds begin to swell soon after Jan. 1. Take for scions the tips of the limbs which have made a growth of from 12 to 18 inches the previous summer. Do not take water sprouts or shoots coming from the trunk or large limbs, as buds from these sprouts are not usually so strong as are those from the normal growth. Cut the scions off back as far as the previous season's growth extends and bury them in moist sand or soil, either in the cellar or on the north side of some building.

About the time the buds on the trees begin to swell, or from about March 1 on, is the best time to do the grafting. The limbs to be grafted should be somewhere between 1 and 3 inches in diameter. They should be sawed squarely off and the stubs split with a chisel down about 2 inches straight through the middle. The chisel is then removed and a wedge about half an inch wide inserted in the middle of the stub for spreading the split. If the wedge is much wider than this, it may not leave room enough on each side to insert the scion. Next, take one of the scion twigs and cut it into several pieces, each having three or four buds. Cut the larger end of the stub so that the third but from the tip comes a little below the end of the stub. Put one scion on each side of the wedge and adjust them so that the inner bark on the outer side of the scion comes in contact with the inner bark of the stub or large limb. Then, pull out the wedge and the wood will spring together and hold the scions. All freshly cut surfaces and the crack in the limb should be covered with grafting wax to keep them from drying out.

A good grafting wax is made by melting together 2 pounds of resin, 1 pound of beeswax and a half pound of tallow. After they are melted the liquid should be poured in cold water and then pulled like taffy until it is of a buff color.—S. Van Smith, Colorado Agricultural College.

KNOCKS SPOTS OFF ANYTHING
Niagara Lime-Sulphur
has the fungous killing power of the mighty Niagara, yet so simple a child can use it. No weighing, straining or clogging of nozzles with NIAGARA LIME-SULPHUR. All sediment is taken out by filter press.
1911 Spray Calenders
Published by the Niagara Spray Co. of Nova Scotia
In getting up these CALENDERS we have endeavored to couple together the best information upon spraying. Extracts are taken from Bulletins, published by Experimental Stations throughout America, including experiments carried on at Cornell University, New York, during 1910.
Every Spraying is Illustrated
Regarding these CALENDERS Mr. John Donaldson, Port Williams, Ex-President of the N. S. F. G. A., says:—"I must certainly compliment you upon the way, manner and style in which it is gotten up. It is the clearest, most easily understood CALENDER I have ever seen, and will, I feel sure, be heartily appreciated by every Fruit Grower in the Annapolis Valley."
Mr. S. B. Chute, Berwick, the largest orchardist in Nova Scotia, says:—"It is the finest thing ever published upon spraying in America"
These CALENDERS can be had on application to **The Niagara Spray Office, Kentville, N. S.**, or by request by Post Card.

Women's Institutes.

Editor Maritime Farmer:

Some time ago I was requested by a friend to express my opinion on Women's Institutes for New Brunswick. The short winter days, and the lack of knowledge of these things so far have hindered. I have been carefully reading the farm papers meantime and trying in this way to gain some information. Recently a notice to the Agricultural Society from Mr. W. W. Hubbard, regarding proposed meeetings for June and July in the interst of Agricultural work, there will be sent in addition to the gentlemen speakers, two ladies who will hold a women's meeting in the afternoon. They will also take part in the evening meeting. This seems a chance for us to learn, if we avail ourselves of the opportunity. Shall we let the government who are trying to help and improve our farm life go to so much expense and we get no benefit, simply because we think we are too busy to attend these meetings? Don't the busy woman on the farm need a day off as much as the man? We have very much to learn. We want to know how to make our homes more attractive. The modern, and in many cases the easier ways of working. Better variety and new ways of cooking. Our grandmothers were good and capable women of their day, but the world is moving on apace, and we would be up-to-date. Need the woman on the farm take a back seat by no means, she is the one who ought to come to the front.

Let us get out of the old ruts and come out together to learn from the strangers, and from each other, by interchange of thought, methods and plans in our every day work.

Last year only a few of us heard Mr. Andrew Elliott, but those who did will make an effort to come out again I feel sure.

A picnic supper is proposed, which promises a good social time; remembering the baskets of course.

Oh, yes, we must plan to be present. Don't be too shy to ask questions on what we want to hear discussed. Then we can go back toiour work with new aspirations and higher ideals. We believe in the near future we see the coming of the organized Women's Institutes.—Sally, Victoria Co., N. B.

Cup Presented by Short Course Students from Prince Edward Island, 1911.

The above cup was presented to the Agricultural College, Truro, N. S., in January of this year, by the Short Course Students from Prince Edward Island, and is to be awarded for the year to the student showing most proficiency in the judging of seed. This cup will be kept permanently at the college and the student who each year wins it, will have his name engraved upon it.

Nakomis, Sask., the commercial and railway centre of the Last Mountain Valley District is one of the substantial new towns on the land of the Grand Trunk Pacific situated in the heart of a rich agricultural district at the junction of the Grand Trunk Pacific and Canadian Pacific's Winnipeg-Saskatoon main line, it has great advantages over other points. And now comes the Canadian Northern, according to their latest folder with a line from Quill Lake country crossing the Grank Trunk Pacific at Nakomis, then leading South-West by the last Mountain Lake in the direction of Calgary. With three railways at the age of five years, Nakomis certainly has a good start in life.

THE ESTABLISHMENT OF APPLE ORCHARDS.

Their Care up to the Tenth Year.

PART II---THE FAMILY ORCHARD.

By A. G. Turney, Horticulturist.

While the first part of this article, which appeared in our last issue, treats only of establishing and caring for young commercial orchards, it must be remembered that the majority of our people are interested in apple-growing from the standpoint of the small home or family orchard.

In but few sections is it impossible provided the necessary precautions are taken to at least raise some varieties of apples, and in others to have a succession of this luscious fruit from summer to spring. Many persons throughout the province have undertaken to plant and grow such an orchard, but either not understanding the essentials of success or through poor nursery stock, unsuitable varieties and lack of attention, their efforts have not been very successful and they have become discouraged. It is therefore in place to refer briefly to some of the more important points.

While many of the principles treated of in Part 1, are applicable in the case of the family orchard, yet there are essential differences and these though quite important are apt to be overlooked. We will therefore treat briefly of these modifications of practice necessary where a person undertakes to raise apples in an amateur way.

The commercial orchardist must of necessity choose the best possible location and site. He has much at stake and cannot afford to take any undue risks. With the intending planter of the small home orchard, however, the case is different. Not only is it often impossible for him to be so particular, but it is not so necessary. In the case of the ordinary farmer the orchard must be planted on his farm and in the case of the small lot holder, it must be planted on the lot. The choice therefore, is narrowed down but the orchard should be located reasonably close to the house and if the position of the house was well selected the soil near it will be fairly well drained. Proximity of the orchard to the house or buildings is not only a matter of convenience but is very important in that it fits in with the home surroundings and adds to the general attractiveness of the house. It is still quite a common sight to see an orchard planted in some snug hollow or ravine in most cases a sure death trap for the trees—frost and wet getting in their work. Gently sloping land capable of tillage, fairly fertile and deep should be sought after. One should remember that slight deficiencies in the site and soil upon which the orchard may of necessity have to be planted may be more than made up for by the close attention and fostering care which it is possible to give to a small orchard.

In approaching the choice of varieties the amateur may exercise a far greater freedom of selection. The points for the commercial orchardist to observe when selecting his varieties are laid down in Part I. In opposition to these the home orchardist who is growing fruit for the use of his family should plant a larger collection of varieties and aim to select those which will give him as far as possible a complete succession of fruit throughout the apple season, from summer to late spring. He should choose family favorites and put quality first. Varieties of special merits may be grown even though the trees possess some defects. Promising new varieties may be tested and some crab and sweet apples grown.

The amateur orchardist ought to give better care and more attention to details to his trees than the commercial orchardist. He should aim to grow really choice fruit without particular regard to the expense of doing so. The situation and soil being favorable, bush fruits and garden stuff should be grown in between the apple trees, thus giving the necessary cultivation and making the orchard a double object of careful attention.

There is but little difference in the feeding of the trees from the course to be followed in the commercial orchard. Well rotted barnyard manure may be used in moderate quantities and commercial fertilizers along the lines suggested. Since home mixing of these in this case is hardly practicable, some of the ready mixed fertilizers may be bought.

The pruning operations will follow the same principles. The spraying should be closely observed and probably better done. A good barrel pump running a single line of hose will amply fill the requirements.

A Spraying Demonstration in a Young Orchard, Riverside, Albert Co., N. B.

Applying lime and lye wash for oyster shell scale. Fresh lime, 30 lbs ; water, 40 gallons; lye, 1 lb. per 40 gallons for old trees and ½ pound for young trees. Note how the tree may be sprayed from all angles by using an elbow to attach the nozzles to the rod. —Photo by A. G. Turney.

It is of but little use to attend carefully to all the different operations and produce a crop of good apples without providing suitable storage. Where the house cellar is used the apples should be stored by themselves and not with other vegetables and other varieties of food. Nothing but good sound fruit carefully handled should be stored as poor and injured fruit rapidly deteriorates and will soon spoil a large percentage of the sound fruit. The coolest part of the cellar should be selected and a temperature obtained as close to 32 degrees as possible without dropping below it. Perhaps the best way of storing apples for this purpose is in boxes and barrels unheaded. Cellar storage in this climate should give good results but the main points to observe are first; very careful and thorough sorting before the apples are placed in the storage; and, secondly, as cool a temperature as possible without freezing.

The family orchard established under favorable conditions and diligently cared for will play a very important part in making the farm home more attractive, and in the case of the town or city worker with a country residence, its care and the interest it arouses are in pleasant contrast to his daily occupation.

The Relation of the Nursery to the Farmer.

The subject of my talk is, "The Relation of the Nurseryman to the Farmer." This relation should be so close and harmonious that the one could whisper in the other's ear at any time. Such, however, is not the case. They have really fought each other. The nurserymen seem to class themselves apart. The farmer resents such an attitude, although the nurserymen may be right in the sense that their self-selection and their trade require more business methods than the farmer is willing to apply to his work.

The fruit grower should be raised up a notch. This can be done only by education. On the other hand, the nurseryman ought to be willing to concede a notch and put himself in the grower's place part of the time. I believe both intend to be honest, but are hardly fair with each other and the one is probably as much at fault as the other.

The practices of some nurserymen are unfair to the fruit grower. It is of these practices that I wish to speak. One is that of substitution, a right claimed by some nurserymen. The purchaser of nursery stock has no assurance of the varieties he is getting until the trees commence to bear. The guarantee of the nurseryman is to replace any tree not true to name. Of what value to the grower is the use of the nursery tree in the place of a bearing tree in the orchard? Unquestionably of insignificent value when compared to the loss of the fruit grower. The nurseryman ought to recognize the grower's position more fully and make a fairer settlement of these difficulties.

Again, some nurserymen are not careful enough in filling orders to select first-class stock only. Especially is this practice true when the trees go to sections where fruit growing is carried on to a small extent. Such discrimination offers an avenue for the disposition of inferior stock where the nurserymen think no objection will be made, but it is a practice which takes undue advantage of the fruit grower and should be stopped. It will be unprofitable for the nurserymen in the end, inasmuch as it discourages future sales in such localities.

There are a few men advertising as nurserymen who in reality buy all of their stock; many who buy part of their stock. Such stock is secured from sources of most advantage to the purchaser. This practice is seriously to the disadvantage of the fruit grower and has made many a customer dissatisfied. It should be discouraged by the nurserymen.

I want to suggest for your consideration the subject of pedigree stock, if it may be so called. Increasing competition in the dairy districts has compelled the weeding out of all but the best cows; cows that are not only of the best breed but are the best in that breed. The time has now come when the fruit grower can no better afford to have unproductive and unprofitable individuals in his orchard than the dairyman in his herd.

We cannot blind ourselves to the fact that an apple orchard possesses individuality just as much as a cow does. Two trees of a similar variety and similarly grown in every respect except that they are from two different scions, differ greatly in the amount and quality of their fruit.

By the time an orchard has come fact that an apple orchard possesses ter for the fruit grower to unwork those trees which prove to be below standard. The place for such selection is in the nursery row and as long as buds and scions are taken from nursery trees and not from the bearing trees of known quality such selection will never be accomplished.

The problems above mentioned seem to me to present the most serious difficulties arising between the nurserymen and the growers, nor is the nurseryman entirely to blame. Too often I find the grower himself is at fault. The solution of these difficulties will lie through a more united effort on the part of the nurseryman and the fruit grower. The fruit grower needs a clearer understanding of the habit of growth of the different varieties of fruits and the necessity of budding from bearing trees of the best type of the varieties. The nurserymen can do much to bring about this understanding, and if done honestly and fairly will work to his interest.

An address by F. B. Wilson, Halls Corner, N. Y., before the recent annual convention of the American Association of Nurserymen.

$5.00 Free.

To the reader who finds the words "seed or seeds" in advertisements in this issue of The Maritime Farmer the largest number of times, we will give $5.00 in cash. If there should be a tie the money will be equally divided between those having correct counts. The words "seed or seeds" in The Maritime Farmers' own advertisements or in the reading matter will not count. The contest closes May 30, 1911. Send in your count. You may get the $5.00. Mention the names of any advertisers to whom you have written or of whom you have bought goods, also tell about how much you or your family have paid for seeds or trees of any kind that your family has bought within the last year.

mportant Announcement in Regard to Wheat Growing in Nova Scotia.

Smut prevalent in Nova Scotia Wheat—Results in poor quality of Flour—Some Millers will hereafter refuse to grind wheat affected by this —Treatment simple and cheap— wheat growers of the province should treat their seed.

The management of the Atlantic Milling Co., of Pictou, N. S., have, during the past few seasons, experienced much trouble from the fact that the wheat sent to their mill, more especially by the farmers of Cumberland, Colchester, Pictou and Antigonish Counties, have been affected by smut. They report the disease as very wide spread and state that it is of such a serious character that, hereafter, they will have nothing to do with this diseased wheat.

This is a serious state of affairs and, in the interest of the wheat growers of the province, the following description of the disease, with methods of treatment, written by Prof. H. W. Smith, is presented. It is hoped that, in their own interests, the wheat growers of this province will treat their seed wheat with one or other of the treatments recommended. The following is Prof. Smith's statement:

"I regret to report to you that "Stinking Smut of Wheat" or "Bunt' "Tilletia foetans, occurs in Nova "Scotia. Specimens of this disease "occur in wheat sold to the Atlantic "Milling Co., Pictou, and forwarded "to me."

"This disease is an extremely seri- "ous one, which if not controlled "may render wheat growing unpro- "fitable. The smutted kernels often "escape injury in threshing and pass "with the good wheat to the mill, "where they render the flour more or less objectionable and unfit for "food."

"The life history of this disease, "which will be called "Bunt" in this brief report, is this: The spores or "seed from the broken affected ker- "nels stick to sound seed and are "sown with the seed. They germin- "ate and penetrate the sprouting "grain and grow up with the plant. "When the grain heads out the "heads of such affected plants take "on and retain a deep green appear- "ance not seen in the healthy heads "and give off a foetid odor, from "which comes both the scientific and "common name (foetans, "Stinking "Smut.") The seeds or kernels be- "come much plumper than the "healthy seed, lose more or less of "the crease and embryo and are of "slightly lighter specific gravity. "They are easily broken open and consist of a firm bran enclosing a "mass of dark spores; these spores "get upon the healthy seed and the "same life history is repeated year "after year. The chaff enclosing the "seed in the spikelet is not affected "thus readily, distinguishing black "'heads' or spike of grain are easi- "ly seen from a distance, while "'Bunt' is indicated only by the "oder and deeper green. With loose "smut the seeds are destroyed and "replaced by a black mass of spores; "with Bunt they retain their shape "nearly, and the spores are revealed "only upon breaking the seeds open. "Loose Smut is easily removed by "the miller, but Bunt ruins the "flour."

"This disease can be effectually pre- "vented by proper care and disinfec- "tion of the seed."

"Wheat to be used for seed should "be removed from the barn in which "it has been stored or threshed "and, after treatment, not returned "to such place again nor allowed to "come in contact with the Bunt "spores in any way. It is advisable "to treat the seed only a day or two "previous to sowing."

"Formalin Treatment.— Prepare a "solution of formalin in water by "adding one pint of formalin to 40 "gallons of water. A pint bottle of "formalin can be bought at any drug "store for about 30c. The grain "should be dipped into this solution "either in coarse jute bags or basket "and then removed and piled up, "covered with cloth or left in the "bags, for about ten hours, then re- "moved, spread thinly on boards, or "other suitable material in the open "air until dry enough to sow, or, "instead of dipping the grain, place "it in thin layers on a flour or plat- "form and sprinkle thoroughly with "the dilute formalin solution. Add "another layer of grain and repeat "the sprinkling until the entire lot "of grain is in the pile. Shovel the "pile over and cover; allow to stand "about ten hours (10 hrs.), spread "and dry. About one gallon of the "dilute solution is required to treat "one bushel of grain. This will "serve as a criterion or guide as to "the quantity of formalin solution "which should be made up."

"Copper Sulphate Treatment.—In- "stead of using formalin, copper sul- "phate (blue stone) may be used. For "this treatment prepare two solu- "tions. First, dissolve two pounds "of blue vitrol (copper sulphate) in "forty gallons of water; also another "solution of two pounds quick lime "in forty gallons water; first slaking "the lime. Place the grain in the "copper sulphate solution for about "twelve (12) hours, then in the lime "solution for five minutes; drain and "dry as with formalin treatment."

"A slight injury results to the germination of the seed with either "treatment, but if care is exercised "not to use the solutions stronger "than stated, or leave in the solu- "tion a longer time, and if such "treated seeds are sown as soon as "possible after treatment little or "no loss will occur."

M. CUMMING,
Secretary for Agriculture.

Spraying Demonstration in an Old Orchard at Riverside, N. B.

The Spirit of the East Aroused.

The next issue of The Maritime Farmer will contain the largest advertisement in a single issue ever inserted in a farm paper in Canada. It will occupy eight pages and possibly more. That we are able to secure such a large advertisement for one issue speaks well for the class of farmers reading The Maritime Farmer, their ability to buy and their willingness to patronize our advertisers. Last fall the advertiser we refer to used several issues of our paper and the response was so general, the prices he quoted so liberal and the call so urgent for this season's quotations, that he was forced to publish his complete price list in our next issue as above stated. He is a firm believer in the possibilities and opportunities for Maritime Province concerns doing a mail order business with Maritime Province people. He is an optimist of optimists; a man who believes in giving a square deal to everyone and does as he believes.

There is no reason under the sun why a Maritime Province business house should not conduct a mail order business, especially when prices are a little better than the best offered by mail order houses outside our provinces. This advertisement will be worth watching for if you are a close buyer and want the best at the cheapest prices. There are a few other things the advertisement contains that are worth looking into. The advertiser to whom we refer is C. B. Pidgeon, Corner Main and Bridge Sts., North End, St. John, N. B. He is a young man with an enormous stock of goods, a wonderfully large number of customers, a fine class of employees and a willingness and sincerity in trying to please those who trust their business with him that is truly inspiring. Watch for his ad. in the next issue and save your orders for boots, shoes rubbers, moccasins, hats, caps, ties, hoisery, braces, gloves, shirts, collars, mens' and boys' clothing, ready to wear or made to measure, of all kinds. We guarantee his reliability and you will be pleased with his goods and prices.

Good Plowing Essential.

In more than one sense spring plowing is more difficult to do right than fall plowing, writes B. E. Dimick, since the conservation of moisture is very important in the spring, while in the fall the moisture will take care of itself. In general, the spring plowing should not be as deep as fall plowing. The aim should be to turn under thoroughly and then to immediately harrow, so as to form a mulch to protect the soil from drying out.

A well-plowed soil, if properly handled, will not dry out as badly in a season of exceptional drought, such as we had the past year, if the plowing is done in the spring instead of the fall, but if neglected and not given proper cultivation, the spring plowing will prove disastrous. I had a piece of spring wheat and a piece of peas last year. Half of the ground was fall plowed and the other half spring plowed. The fall plowing was disked as soon as we could get on it. The spring plowing was followed the day of plowing with the harrow. After the first rain the whole of the ground was harrowed again, and then the whole piece was sown exactly alike. The fall plowing gave us almost no crop at all, while the spring plowing matured a good crop, the season considered. In a very wet season I have found exactly the reverse of this experience to hold good.

There is usually so much work on hand seeding in the spring it is a difficult matter to find time to do spring plowing to any great extent if the old one-team method is adhered to. It is expensive, too, on account of the scarcity of laborers. To obviate this, I make it a practice to put on as many horses to the man as ptacticable. One man with a four-horse team will do twice as much work as two men with the same teams and do it better. A gang plow does the business with the plowing, and the same outfit of horses can be put on a wide harrow or other machinery, so that the whole of the farm operations may be gotten through in half the time, with half the number of men, and one-third less expense. I make it a rule to have all the riding machinery I can use to advantage. Riding plows, riding cultivators and a harrow cart take the leg strain off the hired man, so that he does not kick as much over the milking, the worst enemy he has on the farm.

Fertilizing the Orchard.

The need of supplying some additional plant food to the orchard is realized when it is considered that a crop of 600 bushels apples with the necessary leaf and wood growth draws from the soil 112 pounds nitrogen, 109 pounds potash and 11 pounds phosphoric acid. Of course, considerable of this is returned to the land when the leaves fall and decay, but the fruit actually removes 47 pounds nitrogen, 57 pounds potash and two pounds phosphoric acid.

Where the trees are making unsatisfactory growth there is little need of using nitrogenous fertilizers. On most soils it is unnecessary to add phosphoric acid, as the amount removed is so small and the supplies in most soils are ample.

Nitrogen can be most easily and cheaply supplied by the growing and plowing under of leguminous cover crops such as clover, cow peas and vetches. These are worth growing for the protection which they afford the soil and the trees.

If more nitrogen is needed to stimulate growth some of the quick-acting forms like nitrate of soda or sulphate of ammonia will give quickest returns. Organic nitrogen in the form of ground fish, dried blood and fine tankage, where they can be obtained cheaply, give satisfactory results, but it takes some time before all the available nitrogen is set free. This is desirable in some orchards, but objectionable in others where early maturity of the wood is desired.

Potash is the one element which is most needed and the element which is most likely to be lacking in many soils. Wood ashes are a common source of supply and are unsurpassed for this purpose. Potash is also obtainable in the form of kainite, sulphate and muriate of potash, the latter two being the forms which are most commonly used. A yearly application of 200 pounds per acre should be sufficient for most orchards.

Canadian Ayrshire Breeders Meet in Annual Session.

The 42nd annual meeting of the Canadian Ayrshire Breeders' Association met in Montreal, Feb. 9th, 1911. The meeting was largely attended, breeders being present from Ontario, Quebec and New Brunswick. The president, James Bryson, of Brysonville, Quebec, opened the meeting with a capital address in which he reviewed briefly Ayrshire interests in 1910 and made a touching rererence to those breeders who at great sacrifice introduced the breed and established our institution. He extolled the virtues of the Ayrshire cow and said she was demonstrating to the world her ability as an economical producer of milk and fat.

The secretary, W. F. Stephen, of Huntingdon, Que., presented a most concise report of the work accomplished in the past year. He also made comparisons of the growth of the association during his 5 year term of office. The membership had increased from 258 in 1905 to 632 in 1910. Registrations had increased from 1768 to 2395 and transfers from 685 to 1079 during the same period.

Also the Record of Performance test had been established, which test was demonstrating the value of the Ayrshire cow as a producer. 130 cows had registered, 39 during the past 8 months, and there were a large number of cows now in the test. He reported the best Ayrshire record in Canada was made by the cow Primrose of Tanglewyld, 15943, owned by Wooddissee Bros., Rothsay, Ont., closed her year with 16,196 lbs. milk and 625 lbs. fat. This cow gave 29,782 lbs. milk and 1154 lbs. fat in two years and freshened three times within 27 months. The cow Annie Laurie 2nd, 15,588, owned by E. Conoon, Harriettville, Ont., produced 15,134 lbs. milk and 598 lbs. fat and rates second in general standing. In the 4-year-old class, the cow Molly, 27,600, owned by E. Cohoon, Harriettsville, Ont., holds the record with 11,268 lbs. milk and 327.46 lbs. fat to her credit.

In the three year old class Canadian Princess, 20,108, owned by A. S. Turner & Son, Ryckmans Corners, Ont., still holds the record having given 11,377 lbs. milk and 521.91 lbs. fat. Mr. Turner also owns the two-year-old heifer which holds the premier record in her class, she having produced 10,355 lbs. milk and 437.39 lbs. fat. In membership Quebec led with 325, Ontario 191, New Brunswick 23, Nova Scotia 20, P. E. Island 10, Manitoba 19, Alberta 19, British Columbia 11 and Saskatchewan 7.

145 new members were received in 1910. Registrations had increased by 22 and transfers 114 over the same period. He also reported that in the dairy tests held in connection with the Winter Fairs at Guelph, Ottawa and Amherst, N. S., the Ayrshires had either topped the list or were a close second. At Ottawa, Ont., the cow Barcheskie Luck Girl, owned by R. R. Ness, had won by 16 points over all breeds. She having given 184 lbs. of milk testing 4.2 percent. fat, thus having scored 216 points, the next best was a Holstein which scored 230 points. White Rose 2nd, owned by John McKee, Norwich, Ont., scored 224.7 points.

The financial statement showed cash on hand, Jan. 1st, 1910 to have been $622.02. Receipts— Registrations, $3324.37; members fees, $1194.00; other sources, $226.10, giving cash on hand $5366.49. The expenditure amounted to $3887.69 leaving a balance of $1478.70. The increase in assets during 1910 was $1058.40. The thanks of the members were extended the president and secretary for their excellent reports and splendid work during the past year. A grant of $100 each was voted to the Ayrshire classes in the dairy test at Guelph, Ottawa and Amherst, and $100 to the Dominion Exhibition at Regina, provided the authorities put up a prize list of $1000.00 in the Ayrshire Classes. It was also resolved:

"That $75 for an Ayrshire, $75 for "a three-year-old heifer, and $75 for "a two-year-old heifer, be given as "champion at Quelph, Amherst and "Ottawa Winter Fairs, December, "1911, and January 1912, provided "the highest scoring at three fairs be "made by purebred Ayrshires in the "dairy test, all Ayrshires competing "to be recorded in the Canadian "Ayrshire Herd Book."

A move has been inaugerated to organize clubs of Ayrshire breeders, where a number live in one community. Mr. A. Hume stated one had been organized at Menie, the day previous. The secretary was instructed to go to Menie at an early date to assist in completing the organization. The Minister of Agriculture was memorialized to approach the Department of Agriculture at Washington and endeavor to have the regulations governing the entry of pure bred animals going to that country modified, so that it will not preclude the entry of Ayrshires registered in Canadian Herd Books before the instituting of a Herd Book in Scotland. Also a resolution was passed asking the Minister of Agriculture to allow the records of those cows that have qualified in the Record of Performance test in milk and fat but have not freshened within the 15 months as required by the regulations to be printed in our 'Annual.'

The following officers were elected: Ont.

President, John McKee, Norwich,

Vice-president, Hector Gordon, Howick, Quebec.

Sec-Treas., W. F. Stephen, Huntingdon, Que.

Owing to increased work and for providing an office with a fire proof vault the salary of the Secretary was increased to $1,000, he to supply all office help.

AYRSHIRE MEN BANQUET.

A new feature of the meet of Ayrshire men this year was the banquet held in the Queen Hotel, Montreal. About 50 covers were set and good justice was done the toothsome viands. The new president, Mr. John McKee, presided and introduced the speakers. Letters of regret were received from the Hon. Sydney Fisher, Minister of Agriculture; Hon. J. E. Caron, Prov. Minister of Agriculture; Dr. Couture and others. Among those present and delivered addresses were Hon. Wm. Owens, J. A. Ruddick, Dairy Commissioner; Prof. Arkell, Associate Live Stock Commissioner; Prof. Barton, Macdonald College; James Bryson, Robt. Ness, E. W. Morgan, Mr. Kennedy, D. Drummond, P. Ryan of Brewester, N. Y., and others. This proved to be a most enjoyable gathering and the Ayrshire came in for not a few bouquets.

AYRSHIRE MEN VISIT STE. ANNE DE BELLEVUE.

The following day about 50 of the Ayrshire breeders and their friends accepted the invitation of Dr. Harrison, Principal, to visit the Macdonald College and inspect the herd of Ayrshires kept on the College farm. Also invitations had been received from Mr. James Morgan, the proprietor of Stony Croft stock farm and from Mr. Bibeau, the manager of LaBois des Roches stock farm owned by Hon. L. Dorget, to inspect the Ayrshires kept at these places. The party were met at the station by Prof. Barton and his assistant Mr. Cooley, who had sleighs to convey the party to the college buildings. After a brief visit was paid several of the buildings the party were conducted to the Stock Pavillion, which had been maile comfortable for the occasion, and where all could be seated and inspect the animals as they were brought into the arena. Many fine specimens of the Ayrshire breed were brought out and breeders had an opportunity to pass comment on their merits. Prof. Barton spoke of the work being done in rearing up the young stock and advised farmers and breeders to feed the calves well and not breed too young. The young stock from the Glenora sire were particularly uniform and of good size and quality.

Some of the Holstein, Dairy Shorthorn and French Canadian cattle kept in the College barn were also led out so that breeders could make their own comparisons. After a hurried walk through the stables the party divided, one lot going to lunch in the College dining room and the other at Stony Croft. At the former place Dr. Harrison gave a few words of greeting. At Stony Croft, Mr. Morgan's manager, Mr. McIntyre assisted by his capable wife, served a sumptuous repast, after which speeches were in order and the time was pleasantly passed until the crowd from the College arrived. Votes of thanks were passed to Mr. Morgan, Mr. and Mrs. McIntyre and to the Secretary, Mr. Stephen, for his efficient work during the year. Mr. McKee chaperoned the College party and Mr. J. Bryson, the party that went to Stony Croft. After lunch a short trip was made to the stables and the 54 head of Ayrshires were inspected as well as the splendid Clydesdales and Yorkshires. The party re-embarking in sleighs provided by the College, Mr. McIntyre and Mr. Bibeau, a visit was paid La Fois des Roches. Here we were met and conducted through the stables by Mr. Bibeau, the manager.

At once we noticed a great improvment on the herd over two years ago. Then less than 25 head graced the stables. Today 85 head of the finest Ayrshires to be seen are in these stables. It was with difficulty the lovers of the breed were constrained to leave, but the station had to be reached and another stop had to be made at the farm of R. B. Angus, his Ayrshires had to be inspected, also the dairy, poultry house and the Conservatory. Here the genial manager, Mr. Burrows, donated a bouquet of flowers to the ladies of the party, Mrs. P. Ryan, of Brewester, N. Y., Miss Grace Gebbie, stenographer of the meeting, Howick; and Miss McIntosh, of Montreal. A hurried run back to the station finished up one of the most interesting and memorable days ever put in by the Ayrshire breeders. Mr. and Mrs. P. Ryan, Brewester, N. Y., considered it one of the most interesting and instructive days ever experienced. And Mr. Ryan further expressed himself much pleased with the harmony which existed between Canadian Ayrshire breeders.

A Well Planned Orchard.

Owned by Mr. Benj. Charters, Chartersville, N. B. This orchard is well laid out and has made very good growth.

Formaldehyde for Smut and Potato Scab.

The use of formaldehyde for preventing smut in grain, is a subject that needs stirring up at this season of the year, and, in order to create greater interest and spread a larger amount of knowledge, we republish, by request, the following extracts from "Diseases of Economic Plants," written by F. L. Stevens. Ph. D., Prof. of Botany and Biologist of the Agricultural Experiment Station of North Carolina, and J. G. Hall, M. A., Asst. in Vegetable Pathology in North Carolina Experiment Station. The work referred to is published by the McMillan Co., New York, and is right up to date. Here is what these authorities say:—

FORMALIN—WHAT IS IT?

"Formalin is a very powerful germicide, which came into wide use about 1889. Its interest to the farmer lies chiefly in its power to prevent potato scab, onion smut and the various smuts of cereals.

"This substance appears on the market under two names, "Formalin," and "40 per cent. Formaldehyde." The substances are absolutely identical, and since 40 per cent. formaldehyde is cheaper, owing to the fact that the word "Formalin" is protected by patent, the customers will, of course, do well to purchase the 40 per cent. formaldehyde.

FOR LOOSE SMUT IN OATS.

"Under the name 'Smut,' 'Blackheads,' etc., the disease is known wherever oats are grown. Grain and more or less of the chaff are replaced by a powdery black mass, which shatters out as it ripens, leaving later only the naked branches of the panicle.

"Usually all the spikelets of a head, and all the heads of the affected plant are smutted. There is considerable difference in the resistance offered by different varieties, but in view of the powerful protection afforded by proper treatment, this is of little significance.

"The damage caused by smut is usually under-rated. In 1884, Aubin, in New York, by actual count, found the oat smut to constitute from 8.5 to 10 per cent. of the ordinary crop. By actual count of 11,000 heads, Plumb, in 1886, determined the amount of smut to be 8.4 per cent. In some fields he found as high as 20, 28 and even 30 per cent. Keller-

man and Swingle counting smuted heads in Kansas, found different fields to have 8, 15.3 and 18.3 per cent. of smut, while single portions of a field showed as high as 39 per cent. The annual loss in the country is somewhere between 10 million and 20 million dollars.

The reasons for under-estimations of oat smut, are the dwarfing of many of the affected plants, which thus remain unnoticed by a casual glance over the field, and the fact that many smutted panicles remain invisible unless unrolled from their enveloping leaves.

It was proven as early as 1858, that infection can occur only upon the very young oat plant, the older plants are immune. It was later determined by Brafield that the plants are immune after the leaves have protruded one centimetre (two-fifths From this it follows that the chief, and, as other experiments have demonstrated practically the only infection comes from smut spores, which are upon the seeds when they are planted. These sprout, producing sporidia, which infect the young plant. The fungus develops in these plants throughout the season, without conspicuous effect, until, at the blossoming time, the fungus seeks the ovaries and the gumes, and appears again as the familiar black spore masses.

Any treatment which kills the spores upon the seed without materially injuring the seed itself, results in a clean crop.

The bluestone treatment so widely used to prevent wheat smut, however, is not advisable for oats, since its use is attended with too much danger to the germinating power of the oat seed. The formalin treatment is thoroughly satisfactory and is preferable. The formalin treatment may be made as follows:

One pound is sufficient to treat 45 to 50 bushels of grain. It should be used at the rate of one ounce to three gallons of water, and, in general, one gallon of mixture suffices to treat one bushel of grain. Spread the grain in a thin layer on a smooth barn floor, canvas, or hard ground and sprinkle with the diluted formalin, either using a spraying machine or a watering pot. Sprinkle so as to thoroughly and evenly wet the grain with the mixture. Then shovel the grain over thoroughly a few times to insure even distribution of the solution and thorough wetting of all the seeds, and cover the pile with canvas, carpets, blankets or bagging to keep the fumes of the formalin within. The pile should stand from six to twelve hours in this way. The seed may then be readily dried by spreading it out in layers about five centimetres (two inches) thick, and stirring frequently. The seed is then ready to sow. All bags, bins, etc., with which it comes in contact should also be disinfected with a thorough application of the formalin solution. The drill that is used should also be disinfected with formalin. On a large scale, oats have been treated by the formalin method, at the rate of 500 bushels an hour, by throwing the formalin solution by means of a steam pump against the grain as it fell through elevators, arranged with deflectors so as to give proper mixing.

STINKING SMUT OF WHEAT.

This smut attacks the grain, not the enclosing chaff. The head remains of much more nearly normal appearance, and is often not until the glumes have been opened and their contents examined that the presence of this smut mass is detected, covered with its membrane and resembling the wheat grain in size and shape.

It may be recognized by an expert observer by its peculiar disagreeeable penetrating odor, and by the deeper green color of the diseased heads. The smut masses are often so firm as to remain unbroken through the threshing, but they may be recognized among the grains by their darker color, greater plumpness, absence of groove and germ, and finally by crushing them and liberating the black spores.

The disease is particularly destructive in that its presence signifies not only loss in value to the good wheat which may be largely depreciated in price by the presence of the bunt. Often bunt is worthless for milling purposes and even for cattle food. Bunt constitutes, for these reasons, one of the worst smuts in the world.

Many smut spores naturally find lodgment upon the surfaces of healthy 'grains from smutted fields, or they may be carried from farm to farm upon the threshing machine. Upon planting such seed the following season, these spores are ready to attack the seedling grain plant. The fungus after gaining entrance into the seedlings, grows with it throughout the season, and appears again at harvest time as spore masses within the chaff. Affected plants are usually smutted in every head and every grain in the head.

The seedling age, like that of the oat, is the only age susceptible to smut infection. Treatment of seed wheat with formalin, as recommended for oats, is complete in its efficiency and trifling in cost.

Formalin is safer in its effect upon the germinating power of the seed than bluestone.

The seed should be dried and the drill disinfected.

POTATO SCAB.

"Scab is recognized by all potato growers as a characteristic rough pitting of the tubers. If these are attacked when quite young the scabs are deep. If the attack is later they are more shallow. In very severe cases the tuber is furrowed or cracked.

The scab at first appears as a minute reddish or brownish surface spot, often when the potato is very young. It extends outward, deepens in color, and is attended with the development of an irregular corky incrustation.

The disease is often prevalent to such an extent as to prohibit successful potato culture. The chief loss comes from depreciation in sale value, though there is also loss in yield. Estimates show that from 5 to 75 per cent. of the potato crop is unsaleable on account of scab.

Scab is most prevalent in alkaline soils and is favored by moisture.

Potatoes may be disinfected by soaking in a solution of one pint formalin to 30 gallons water for two hours. This treatment should be applied some time previous to planting, provided the potatoes are not exposed to reinfection by being put into receptacles, bags, buckets, etc., that have previously held scabby potatoes. The treatment should be made before the potatoes are cut for planting."

Formaldehyde and Formalin.

One of our Nova Scotia subscribers wishes to know the difference between formaldehyde and formalin. Practically there is no difference. All formalin is formaldehyde, but in the very strictest sense not all formaldehyde is formalin. The term "formalin," is simply a patent name copyrighted by a firm of German chemists and is used to label their brand of formaldehyde. Unfortunately it has very generally used in speaking and been picked up by the public, and is writing as relating to all makes of formaldehyde. The reason why this came about, we suppose, was because this imported article, with the copyrighted name, was used to a considerable extent by the medical profession and others for disinfecting purposes before its usefulness was superseded covered in connection with killing smut in grain. The early experiments with grain would naturally be made with the imported article, labelled "formalin," and so this name was put into common use. "Formalin" is just a plain 40 per cent. solution of formaldehyde, exactly identical in all practical respects with any other formaldehydes on the market, except for the patent name that it bears. But now we have the Standard Chemical Company manufacturing formaldehyde in Canada, and supplying in a most satisfactory way a very large proportion of our general trade, and we should hope to see the term "formalin" drop into disuse, and the general and correct term "formaldehyde" receive adoption by all.

The Best Farm Paper.

Editor Maritime Farmer:

Enclosed please find $2.00, which place to my credit against subscription to The Maritime Farmer as long as this lasts, and when it is exhausted I will repeat.

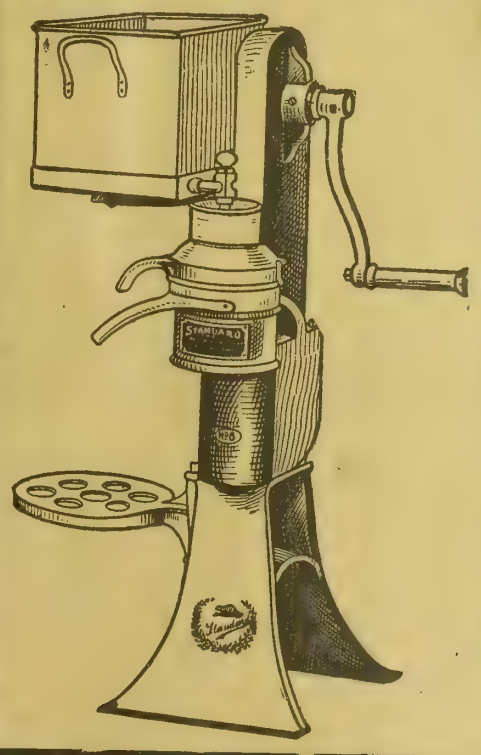
I am reading your publication with great interest, as I regard it as the best publication circulated in the Maritime Provinces so far as agricultural interests are concerned. I have also looked over with pleasure the circular you enclose, headed, "A Chat With Our Readers." Your suggestions are most timely. I have done a little experimenting in the way of crop raising, and am now preparing a piece of land which I intend in 1912 to seed with Alfalfa. If it can be demonstrated that this very excellent grass can be grown in this province, as I have no doubt it can, it will go a long way to solving the feed problem in our country. It would seem a reasonable, as well as an excellent departure, if our provincial governments adopted the policy of the Saskatchewan government in this particular and offered prizes for experimental plots, in the hope of interesting the farmers more generalmatter should be taken up energetily and with this in view I think the cally by our agricultural societies throughout the Maritime Provinces. There is no difficulty in this locality in growing from 800 to 1,000 bushels of turnips to the acre. When less than these quantities are grown, the fault lies with the preparation of the land or in the fertilizer and care of the crop.

Trusting your paper will receive the cordial support of the agricultural community throughout the Maritime Provinces, rendering it possible to continue the excellent work you are now doing. I remain, with best wishes. Yours very truly,

W. G. CLARK.

Digby Co., N. S.

The Most Attractive Agency Proposition



ever offered is the Standard Cream Separator agreement. Although our organization in the Maritime Provinces is not more than a few weeks old, territory is being covered rapidly and every day's mail makes it harder for you to get an agency. Write at once telling us what territory you are in a position to handle. Do not delay. Our proposition is so attractive that even now nearly every territory is taken up.

We help our agents by advertising our machines and turn prospects into agents when replies are received from their territory. Following are a few interesting facts: —

The new "STANDARD" book, just published, tells about the latest achievements in cream separators. It is not made up of FICTION, but of FACTS.

It describes the perfect running, perfect skimming Separator shown here and explains why a Separator that runs in a bath of oil lasts longer and runs easier and steadier than one depending on an oil can and glass lubricators.

It also explains why the "STANDARD" Separator gets more cream from the milk that can be got with any other Separator.

YOURS FOR THE ASKING.

Write us now and you will be sent one of these booklets, postpaid, free of charge; also the facts of a recent contest at Port Rowan, Ont., in which the "STANDARD" demonstrated its skimming supremacy.

WRITE NOW.

Seed time and Seed Potatoes.

That seed time and harvest occur with unfailing regularity is one of the platitudes which have an important part in the regulation of the farmer's system of farm management. That each is dependent upon the other, the farmer well knows, and he is beginning to realize the full significance of the manner in which the harvest depends not only upon the seed time but upon the seed. So much has been said about the importance of good seed that it would seem as though every farmer should have been deeply impressed long before this time with the tremendous importance to himself of having positively first-class seed for every crop which he expects to raise.

So thoroughly has it been demonstrated that seed of good germinating qualities, of strong vitality, high productivity and a settled type, is worth many times more than its cost in the increased yield that it assures, that it would hardly seem necessary to repeat it. Yet it is undoubtedly true that a great many farmers will plant again this spring seed about which they really know very little or nothing, or which ha perhaps been gathered from a field or garden which has produced only fairly well in the year just past.

Comparatively few farmers are giving their seeds any sort of test or are demanding that the seed which they buy shall have been test ed. Those who have made a test for germination qualities before planting have invariably found that the increased yield more than paid for the trouble and expense. These suggestions are all trite, but they are none the less valuable.

The amount of turnips which one gets from an acre does not depend entirely upon the care, cultivation or fertilization which is given it. The kind, quality, fertility and adaptibility of the seed is a most im portant matter and should receive first consideration. The same considerations are applicable in grow-potatoes to a much greater extent than most of us have been realizing.

The potato business can be saved from demoralization by the adoption of wise methods in planting, cultivation, harvesting and marketing, but principally planting and marketing. And take it all together, the matter of planting is not the least important by any means. Potato growers are beginning to acknowledge that the seed potato should be given a great deal more attention than it has ever had before.

For a long time, potatoes for seed have been required to measure up to a little higher quality, especially in appearance, than those which were simply offered for food, but several points have escaped the attention that ought to have been given them because of the former prevalent belief that "potatoes are potatoes." There are varying qualities of vitality and germinating power in potatoes as in every other seed, as every planter should realize when he looks over his field and notices the places where he has failed to get a stand of vines. A potato is a potato, but not every potato which is sound is a good potato, either for food or for seed. Therefore, potatoes which will give a thorough and even stand of vines over an entire field are the only kind which are fit to use for seed. The planter should know the germinating qualities of his potatoes as well as his other seeds before putting them into the ground.

Certain physical qualities as well as what we might term moral qualities are much desired in potatoes these days. We are not finding those qualities to any great extent, but the demand will increase and the man who will grow potatoes which will measure up to those qualities may even now demand and receive a fancy price. One of the first of these qualities is the uniform size, and that size not too large. The potato to be desired is of an even roundish shape and of a size only moderate, perhaps about three inches in diameter, preferably somewhat oblong or flattened in form. The day of large potatoes has passed. Large potatoes and many in the hill will make more bushels for the grower, but it will not be long before the large potatoes will have to take a lower place in the market along with those of too small size. Seed which will grow potatoes of uniform size, no large ones, and as few small ones as possible, is the seed to be required for the future.

Then the matter of regularity in shape and shallow eyes is most important. These qualities make for economy in the table use of the popular spud and are being more and more demanded. At the present time, the man who will grow that kind of potatoes may get a fancy price, but it will not be long before the general demand will be for potatoes with those characteristics, and potatoes which do not have them will be relegated to a place in the rear.—M. F.

A $5.00 Prize

We will give a prize of $5.00 to the person making the largest purchase from one or more of the firms advertising in the February, March and April issues of The Maritime Farmer. Send for catalogue and information to each advertiser and see if they have something that you want. The only condition attached to this offer is that you mention The Maritime Farmer when writing, and that you send us a list of those to whom you have written and the amount purchased from each adver tiser. We believe our advertisers can offer you better value than can be obtained elsewhere and see no rea son why you should not patronize and secure this prize. All lists must be mailed us by April 30th. Address Advertising Manager, Maritime Farmer, Sussex, N. B.

ALFALFA SEED . . FREE

WE want farmers in the Maritime Provinces to become better acquainted with us and our seeds. We use the utmost care in selecting our seeds, but unless you give them a trial you will probably never know what you are missing in not getting them direct from us. With a view to our getting in touch with each other—to both our mutual advantage—we are going to offer, for a limited time, a one-half pound package of Alfalfa Seed absolutely free—one package only in a family—to each and every farmer who sends for our seed catalogue. Sending for catalogue does not in any way bind you to buy from us. Write to-day and get one-half pound Alfalfa seed free.

Geo. Keith & Sons,
124 King St., E. Toronto, Ont.
Established 1866.

This offer is not binding unless you mention the Maritime Farmer when writing.

A Windsor Lady's Appeal.

To All Women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painfull or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write to-day. Address Mrs. M. Summers, Box H 309, Windsor, Ont.

Diarrhoea should be cured without loss of time and by a medicine which like Chamberlain's Colic, Cholera and Diarrhoea Remedy not only cures promptly but produces no unpleasant after effects. It never fails and is pleasant and safe to take. Sold by all dealers.

Another Mile-Stone in the History of the N. S. A. C.

Editor Maritime Farmer'

The 1910-11 session of the Nova Scotia Agricultural College closed on Thursday, April 13th. The session was the most largely attended and the most successful in the history of the College. The total enrollmen was 62, of whom 41 were from Nova Scotia, 4 from New Brunswick, from Prince Edward Island and 12 from foreign countries. While this is not, by any means, as large an enrollment as there should be, yet it compares very favorably with the enrollment of the older established institutions in Canada. For example, there were enrolled at the Ontario Agricultural College, Guelph, from the province of Ontario last year, 295 students, in comparison with 41 enrolled at Truro from the Province of Nova Scotia. But Ontario has over nine times the area under cultivation that Nova Scotia has, from which appears that, in proportion to the size of the constituency, the Nova Scotia Agricultural College has already enrolled a number of students that compare favorably with the number enrolled at the older established institutions of Canada. It is exceedingly satisfactory to record the representative character of the enrollment, including, as it does, students from Cape Breton, all the way to Yarmouth and from nearly all the intermediate counties. However, the College is only in its infancy and, if as much progress is made in the next few years as in the past five years the attendance will be a record one for the Dominion.

The most interesting feature in connection with the closing exercises was the presentation of the Murray and the P. E. I. Students' Cups. The former Cup was presented by the Hon. Mr. Murray, Premier of Nova Scotia, to be awarded to the student making the highest standing in the judging of live stock. It was won by W. L. McFarlane, Fox Harbor, Cumberland County, a second year student, who was the runner up for the cup in his first year. The Hon. Mr. Murray presented a similar cup last year, which was won by E. S. Leonard, of Paradise, Annapolis Co.

The P. E. I. Cup was presented to the college by the Short Course students who attended the institution from Prince Edward Island in January last. It is to be the permanent possession of the College, but each year the student who stands highest in the judging and selection of seeds is to have his name engraved upon it. The winner for the year 1911 is W. G. Oulton, of Lorneville, Cumberland county.

The next session of the College commences on November 1st next, and as a sort of precusor of a still larger attendance, the Principal received on the very day of the closing of the 1910-11 session, three applications for entrance to the session of 1911-12.

M. CUMMING.

Young Apple Trees Preferred.

Western fruit growers have for some years past been using one-year-old apple trees for planting, in preference to the two-year-old that are used by the eastern growers. The reason for preferring the one-year-old trees is that the head can be shaped at the exact hight the grower wants it, and the limbs can be arranged in a more desirable manner. In stock that is headed in the nursery it often happens that the head is too high, and the limbs forming the head are so close together that they make a weak union and are more or less liable to split when loaded with fruit.

INVESTIGATION OF ALL SEPARATORS EMPHASIZES IHC SUPERIORITY

You cannot afford to buy any separator before comparing it with others. You should not take chances. The closer you investigate all separators, the more you will be impressed with I H C superiority. You will then know how much closer the I H C skims, how much longer it lasts, how much easier it is to clean, and how much easier it is to turn. There are no weak spots in an I H C Cream Harvester.

I H C Cream Harvesters are the only separators with dust-proof and milk-proof gears, which are at the same time easily accessible. The frame of an I H C Cream Harvester is entirely protected from wear by phosphor bronze bushings. The I H C has large shafts, bushings, and bearings; it has a perfect oiling system; the flexible top-bearing of

IHC Cream Harvesters

is the strongest and most effective found in any separator; it has only one spring. I H C Cream Harvesters always run steady—without vibration. I H C Cream Harvesters are equipped with a patented dirt-arrester which removes the finest particles of dirt from the milk before the milk is separated. The crank is at the right height for easy turning, and the tank is at an easy height to fill.

The I H C local dealer will be glad to point out the above features and many others. Made in two styles—Dairymaid and Bluebell—in four sizes. Write direct for catalogue, or nearest branch house.

DAIRYING.

New World's Record.

"Made in Canada."

Brampton Lady George on February 7th, 1911, established a record not to be forgotten.

On February 8th, 1910, when two years and sixty-six days old she dropped her first calf, and for 365 days her milk was weighed in accordance with the rules of the Canadian Record of Performance, the test being authenticated by the record officers, her monthly production being as follows:

February 8 to 28	517.75
March	1022.4
April	998.4
May	1033.5
June	1001.6
July	1019.1
August	938
September	883.2
October	830.5
November	794
December	915.3
January	837.6
February 1	7193.4

making a total for yearly period of 11004.75 lbs. of milk which yielded 536.045 lbs. of butter.

Brampton Lady George's sire and dam were both bred and raised at Brampton by B. H. Bull and Son, the former being by Blue Blood, the latter by Brampton Monarch, imported.

Brampton Lady George dropped her second calf March 3rd, 1911, less than thirty days after completion of the test. She was exhibited at Toronto, also contended in Winter Fair dairy tests at Guelph and Ottawa, at each she averaged 28.9 lbs. of milk per day, for the three days of the test, the former being in December, the latter in January when within sixty days of calving.

This record gives her the world's milk record of Jersey heifers, under two years and six months at commencement of yearly authenticated test. She is about 250 lbs. ahead of her nearest rival, a heifer owned in Pennsylvania, her milk record is above that made by any other Jersey, any age, tested for record of performance. Her butter record is highest of Jerseys on Canadian record of performance.

Quoting from the latest report of Canadian record of performance, "Brampton Lady George has the Canadian butter record for heifer under three years at commencement of yearly authenticated test.

When one considers that Brampton Lady George was not fitted for a trot, in fact she had calved a couple of weeks before she was entered for test, then she was travelled to Toronto fair and home and the two hard winter fair trips, it is a very creditable record, and for eight out of twelve months of the test she carried a calf.

Blood will tell. Her dam Brampton Electra is now being entered for yearly test and promises very good, they are a very persistent family, and the female descendants of Brampton Monarch are with few exceptions great yearly butter cows.

There are many animals in the Brampton herd bred close akin to Brampton Lady George.

Canadian Jerseys have made several good records. Adelaide of St. Lamber, a daughter of Princess Minette and sister of Minette of Brampton, both owned by B. H. Bull and Son, holds the world's Jersey monthly milk record. Minette of Brampton is dam of Brampton Lady George's sire, while all will recall the world famous test of Mary Ann of St. Lambert.

Milk Fever.

This very common disease still seems to baffle a great many farmers, judging from themany inquiries that have recently been received at the Colorado Agricultural College. No person, whether veterinarian or not, should fail to diagnose this malady when it is in typical form. Usually the best cow in the herd is affected; in any event, she is sure to be a heavy milker. She has been fresh from twelve hours to a week. She is found down, unable to rise, with the head turned into the flank. She appears to be almost lifeless, and, indeed, the condition seems to be similar to fainting in man.

Whenever the above symptoms are present, with the history, then you can say milk fever is the trouble in nearly all cases.

Now, the name is peculiar, for there is no milk, neither is there any fever; but some one called it that to start with, and the name clings. Parturient paresis is certainly a better term, because it is a paralysis associated with parturition.

We will suppose the cow is found in this condition. What are you going to do about it? The most important things are what not to do. Do not give any feed or medicine by the mouth, and do not allow anyone else to so so. This is imperative because whatever is poured into the mouth is likely to go into the lungs, and even though the cow recovers, she will die later of pneumonia. Do not destroy her, thinking she will surely die, anyway. I know she has that appearance, but the fact remains that about 999 out of every thousand can be cured.

Get a veterinarian, if one can be had, because here is a case above all others where a small fee to a competent veterinarian will return itself many fold.

If it is impossible to secure a veterinarian, then give the air treatment, which has been described in all farm papers for several years, and don't give anything else. Remember, however, that even as simple a thing as the air treatment seems to be, it has not given the results that have been claimed for it, in incompetent hands. And this for reasons which are easily explained. First, lack of proper equipment with which to give it; and second, because of lack of absolute cleanliness on the part of the operator. By absolute cleanliness I mean that every piece of apparatus used, and all the air injected, must be rendered free from germs. Otherwise, mammieis results and this is nearly as bad as the original malady.—I. E. Newsom, Colorado Agricultural College.

Dairymen Must Rear their own Dairy Cows.

Dairymen are coming face to face with the fact that if the industry of dairying is to be greatly improved from the standpoint of production, they must rear their own dairy cows The low production standard of western cows is no credit to the country. That it is low is a fact proven by tests and also by general observation and statement. Were all cows in the Maritime Provinces tested, the average production would no doubt be much less, even, than it is generally supposed to be. This is ordinarily the result of what tests are made—the cow owners are surprised that the yields oft their best cows are actually so low as shown by the scales and tester.

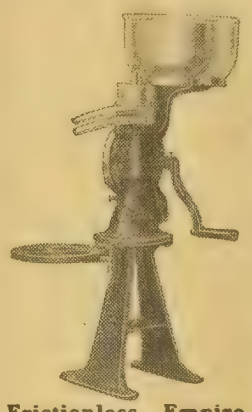
Better cows are needed. That is an admitted fact. Ordinarly the farmer has two means at hand of securing things on the farm, viz., raise them or buy. In the case of milch cows the only really proper course to follow is to produce them right on the farms. There are two very good reasons for this. In the first place good dairy cows are not to be had in the West and to go East or South for them is not practicable because the prices are, or at least seem to be prohibitive. Such cows are to be had here, generally speaking, are anything but high class milch cows. They have not been bred for milk production. In fact many are of nondescript breeding and not well suited either for beef or milk production. The dairyman does not want this kind of cow and the average milk producer feels that he cannot afford to pay the price asked for eastern or southern bred cows.

"Breed them yourselves," is the best advice that the dairyman can get. The first essential is a good bull. Continually use the best blood on the sire's side that can be secured. Start with as good cows as possible, save the best heifers, gradually discard the low yielders

Cream Profits That Stay in Your Pocket

Empire Disc

THERE was a time when the first cost of a cream separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the



Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest returns for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

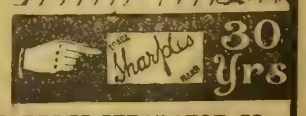
SHARPLES

Dairy Tubular Cream Separators Are The World's Best. They Are Rapidly Replacing All Others

Sharples Tubular Cream Separators produce twice the skimming force, skim faster and twice as clean as others. Repeatedly pay for themselves by saving cream all others lose. Farmers who know this prefer to buy Tubulars rather than take any other as a gift. They know others soon lose the price of a Tubular and keep right on losing.

Farmers, all over the world, who have other separators are rapidly discarding them for Tubulars. They figure, as you will figure, that it is cheaper to throw other machines away and buy a Tubular at once than to keep on using other machines that lose the price of a Tubular time after time.

No disks or other contraptions in Sharples Dairy Tubulars. Built on a later and better principle than others. Only known construction that overcomes the many parts and disadvantages of others. Patented. Cannot be imitated. In world-wide use many years. Wear a lifetime. Guaranteed forever by oldest separator concern on this continent. Manufacture of Tubulars is one of Canada's leading industries.



You can own and use a Tubular for less than any other. Buy one Tubular for life. Let "peddler's" and other cheap machines alone, for they last, on the average, about one year. Our local representative will show you a Tubular inside and out. If you don't know him, ask us his name. Write for catalog No. 194

THE SHARPLES SEPARATOR CO., Toronto, Ont., Winnipeg, Man.

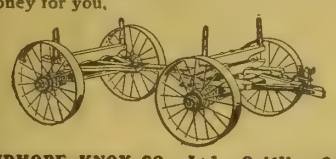
These Mighty Wheels are Tried and True.

Thousands of users testify to the superiority of T-K Wide-Tire Steel Wheels. They have four times the strength and durability of ordinary wheels—defy the worst roads, rocky, sandy, hilly or muddy, and lighten the draft on horses from 25 to to 50 per cent.

TK Wide Tire Steel Wheels and Handy Farm Wagons

Our wagons are designed especially to meet the demands of farmers for a wagon to do all kinds of work on the road and around the farm. They are built low for ease of loading and unloading, and will roll over the ground with the heaviest load without tiring the horses.

Write for descriptive catalog telling how T-K vehicles and wheels will earn more money for you.



TUDHOPE-KNOX CO., Ltd., Orillia, Ont.

and in a very few years great improvement will be effected.

This is a subject worthy of greater discussion and more consideration on the part of cow owners. But the above is the outline of what may be made the programme of a systematic method of improving the dairy herd.

The Good Feeder.

The good feeder is not the one who, with a varied assortment of feeds, regardless of cost, at hand, stuffs and coxes the cow into the effort of working all her digestive and milk giving functions to their limit for the purpose of making a sensational weekly, monthly or even yearly record; carrying the cow so closely to the danger line that collapse and ruin follow the completion of the test strain, writes W. F. McSparran, in Ohio Farmer. By this method a cow of remarkable ability is lost for practical usefulness, and lives only upon the memory of the great work she has been unnaturally forced to perform. Nor, on the other hand, is he the good feeder who is so timid that he allows his cows to go under-fed for fear that enough will wear out their digestive organs and shorten their period of usefulness.

I am a lover of good cows capable of doing continuous good work, but I would much rather own a cow fit to go into any competitive demonstration, conducted by record-making feeders, and keep her out of it, rather than to own her after she has come out of it. To my mind, the good feeder is the one who can take the good cow as a business factor, and by feeding her to the profitable limit of the cheaply produced farm products, with such additions of mill products of proven integrity as may profitably be used, keeping the yearly milk tide to its maximum flow while the robust health of the cow always holds a recuperative margin in reserve, her keeper saying: "Behold how strong and healthful she is! She did this work last year. She could have been made to do a little more, but what she has done she can do again. She has not had her powers weakened by overwork, but rather developed and strengthened by the salutary exercise of full work."

The good feeder, like the good engineer, is the one who has no break downs, pulls the heaviest load with a reasonable expenditure of energy and knows all the time that a little more could have been done—but not exactly safe for the continued usefulness of the equipment. The good feeder is not the one who takes a large assortment of the highest-record for a cow, but the one that priced feeds and makes a short run combines the produced and bought feeds so skilfully that a maximum quantity of the former and a minimum quantity of the latter are used in encouraging the cow to do her big work easily and profitably. This feeder, while doing this, has always given first consideration to the well-being of the cow, has not striven to make her so much a record breaker as a profit maker. This is a good feeder.—Maine Farmer.

Your money back if you don't get a square deal from any one whose advertisement in The Maritime Farmer you answer. That is what our guarantee means and it applies to every advertiser in The Maritime Farmer. But you will get a square deal.

Ayrshire Records.

The cow Snowflake, 19739, owned by A. S. Turner & Sons, Ryckman's Corners, Ont., gave in 26 days in December 1910, 61.27 lbs. fat, and in January 1911, she gave 1871.25 lbs. milk, and 85.48 lbs. fat, equal to 99.73 lbs. butter or an average of 3.21 lbs. butter per day.

The Ayrshire cow, Netherhall Brownie 9th, imported, 23985, American Herd Book, owned by J. W. Clise, Redmond, Wash., has lately closed her year's test with 18,110 lbs. milk and 780.91 lbs. fat, equal to 911 lbs of butter. This cow was tested under the supervision of the Washington State Agricultural College. Netherhall Brownie 9th, holds the world's Ayrshire record of milk and fat. It is up to our Canadian Ayrshire men to go one better than this record. We are constantly discovering some wonderful producers among our Ayrshires thanks to the advanced Registry and Record of Performance tests.

The Cow and the Man..

The North Dakota College sends out the following circular about cows:

"If a cow gives 175 pounds of butter in a year is worth $60, how much is a cow worth that gives 350 lbs. of butter in a year? Suppose that butter will average 25 cents the year round, and it will do better, and that the feed is worth $40 for the year. The first cow would give a return of $43.75, less $40 for feed would leave a profit of $3.75, counting that the milk, calf and manure pays for the labor. The second cow would give a return of $87.50 for butter and would give at least 4,000 pounds more of milk, which, at 20 cents per 100 pounds, and it is worth more for feed, would bring $8. The calf from the good cow is also worth more, but let that go. The return would be $95.50, less $40 for feed, or a profit of $55.50 on the same basis as the other cow made a profit of $3.75. It would take practically 15 175-pound cows to make as much profit as the one 350-pound cow. $3.75 is 6.2 per cent. on $60, and $55.50 is 6.2 per cent. on $895.16 On the basis of percentage income, when the 175 pound cow is worth $50, the 350 cow is worth $895.16. The keeping of the cows should be looked at from the business standpoint. The poor cow is dear at any price, but the good cow is usually not rated at her real value."

Our answer is that it depends on the man in front of the cow, for the feeding and care is what does it. Put a purebred cow in the hands of a scrub dairy man and a scrub in scrub dairyman and a scrub in charge of a good man and we will back the latter. We buy fertilizers and feeds on the strength of their analysis—or at least we ought to—but the real test is the man who uses them. Some farmers will waste plant food or feed. That is why the dairy value of a cow or the farm value of a fertilizer will depend on the man.

We Now Have Ready for Delivery

The New Capital Separator

You will recognize at once the LOW TANK feature of this type and the solid yet attractive appearance of the machine as a whole. THE BOWL is the same as we always used. The lightest, most compact, easiest washed bowl on the market. BALL BEARINGS are used throughout the machine, thereby reducing friction to a minimum, making the machine extremely easy to operate. THE GEARS run in a film of oil produced through the phosphor-bronze spiral gear wheel being continuously immersed. The same CLUTCH DEVICE that has made the Capital famous has been adapted to this type, so that when the handle stops all gears, except the one running in the oil, are instantly stopped, and nothing but the soft whirling noise of the bowl can be heard. WHEN GEARS DON'T RUN THEY CAN'T BE WEARING. This advantage is apparent to every one. Notice also the high crank; the centre of the crank shaft being about 2 feet, 9 inches from the floor, which permits the operator to assume a most natural position when turning. This type is made in two sizes, No. 6, capacity, 500 lbs. per hour; No. 8, capacity 750 lbs. per hour. We are **not** discarding the former style of Capital, which has deservedly won many friends, but we are introducing the above style so as to give purchasers a variety to choose from.

HARROWS.

We are told by good farmers who know, that our Lever Harrows are the best going.

Farmer Smith "changed his mind last year" and bought one of this kind "instead." We asked him lately how he liked it. "Mighty glad I changed my mind and took it." Same story we hear on all sides.

Holds steadier in work. Cultivates to any depth required by a touch of the levers.

Saves time because it works more effectively.

Made in sizes 9 to 17-Teeth.

Bailey-Underwood CO., Limited, New Glasgow, N.S.

Every family and especially those who reside in the country should be provided at all times with a bottle of Chamberlain's Liniment. There is no telling when it may be wanted in case of an accident or emergency. It is most excellent in all cases of rheumatism, sprains and bruises. Sold by all dealers.

"Sells his Crown Wire and Iron Fences and Gates at factory prices, also barbed, coiled, and plain wire, fence tools, etc. Ask for free catalogue."

LIVE STOCK

Substitutes for Skim Milk.

It is not an easy matter to suggest a substitute for skimmilk for feeding calves, as nothing has ever been found that will entirely take the place of milk for rearing the young. Experiment stations have spent considerable time in determining methods and combinations of feeds by which the amount of skimmilk used for raising calves can be reduced to a small amount, but it is not reasonable to expect that the best and finest looking calves can be grown upon a milk substitute. A calf should have for the best results a liberal supply of milk for the first six months; but there are instances where it does not seem wise to have milk form the entire ration for the calf.

In the following paragraphs we give some of the substitutes suggested by the different experiment stations. The Louisiana station reports a method of feeding calves in which milk was dispensed with entirely after the first few days and their system of feeding is as follows:

"The calves are taken from their dams a day or two after birth and taught to drink from a pail. They are then given five to eight pounds of their mother's milk twice a day until the milk is fit for human use, which, of course, will vary with the different cows, but on the average the milk may be saved on the fifth day after calving. The milk is then reduced until at the end of ten days the calf is receiving one pint of milk twice a day, and this amount of milk is fed until the calf is six weeks of age, when the milk is discontinued entirely. At the same time that the milk is being reduced, bean soup, shorts, blood meal and sometimes cottonseed meal are added to the calf's ration until at the end of ten days it is receiving twice daily, in addition to its pint of milk, bean soup from four ounces of navy beans, three ounces of shorts, one ounce blood meal and probably about half the time three ounces of cottonseed meal. The calf receives this ration until it is six weeks of age, when the milk is discontinued and the same amount of the substitute fed as before until the calf is four months old, when it is weaned; that is, put on dry feed entirely. The calf is encouraged to eat hay as soon as it will."

It is thought that the failures in the use of this plan are due to faulty preparation of the bean soup and the following method is recommended as likely to give success:

"Parboil the beans in soda, then drain off the water and boil until soft. Squeeze through a colander and add salt until the soup has a decided brackish taste. Stir in the shorts, blood meal and cottonseed meal and add luke-warm water until each calf receives about three quarts of the mixture. Of course the amounts to be given will vary with different calves. The above figures are the average for strong grade Holstein calves. The cost of the milk substitute is between four and five cents per day."

We are inclined to the opinion that it would be well to omit the cottonseed meal from the mixture as several reports have come to us that cottonseed meal has proven injurious to young calves and Henry's Feeds and Feeding also mentions several instances where calves have died when cottonseed meal was fed regularly. Alfalfa hay is preferred, with peavine hay as a second choice, and calves have access to grass whenever there is any.

The North Carolina Experiment Station fed rolled oats as a partial substitute for milk in calf feeding and their methods of feeding calves were as follows:

First week—10 pounds whole milk.

Second week—8 pounds whole milk, 4 ounces rolled oats.

Third week—6 pounds whole milk, 8 ounces rolled oats.

Fourth week—4 pounds whole milk, 12 ounces rolled oats.

Fifth week— 2 pounds whole milk, 12 ounces rolled oats, .2 pound grain mixture.

Sixth week—2 pounds whole milk, 12 ounces rolled oats, .4 pound grain mixture.

Seventh week — 2 pounds whole milk, 12 ounces rolled oats, .6 pound grain mixture.

Eighth week—2 pounds whole milk, 12 ounces rolled oats, .8 pound grain mixture.

Ninth week—2 pounds whole milk, 12 ounces rolled oats, 1 pound grain mixture.

Tenth week—12 ounces rolled oats, 1 pound grain mixture.

Eleventh week—12 ounces rolled oats, 1 pound grain mixture.

Twelfth week—12 ounces rolled oats, 1.2 pounds grain mixture.

Thirteenth week—12 ounces rolled oats, 1.2 pounds grain mixture.

The grain mixture consisted of one part each of corn meal, linseed meal and wheat bran.

The milk was always added to the oat preparation just previous to the feeding. In addition to the above feeds, the calves received all the hay they would eat during the winter, while in spring they received one feed of hay with pasturage additional.

On the basis that one pound of rolled oats is equal to one gallon of whole milk, and that whole milk is worth eight cents per quart to milkmen, the cost of feed for a thirteen-weeks-old calf receiving no rolled oats is $26.96. When rolled oats (which cost 4.4 cents per pound delivered in barrel lots) are substituted for milk as shown above, the cost of the calf feed for the same period is only $12.46, a saving of $15.50 in favor of rolled oats.

One thing that especially commended itself in the rolled oats feeding was the evident relish with which the claves devoured them. The extra labor entailed in the feeding of the rolled oats was insignificant as compared with the saving effected.

One precaution to observe in feeding rolled oats to calves is not to use it in too large quantities, owing to the laxative character of this feed. Indeed, our experience indicates that it is best not to feed more than twelve ounces daily to each calf. It is important also that the rolled oats and milk be supplied as near the temperature of blood heat as possible.

The average gains made were slightly better for the calves fed rolled oats than for the calves fed skimmilk, and good development was shown.

WINDSOR DAIRY SALT

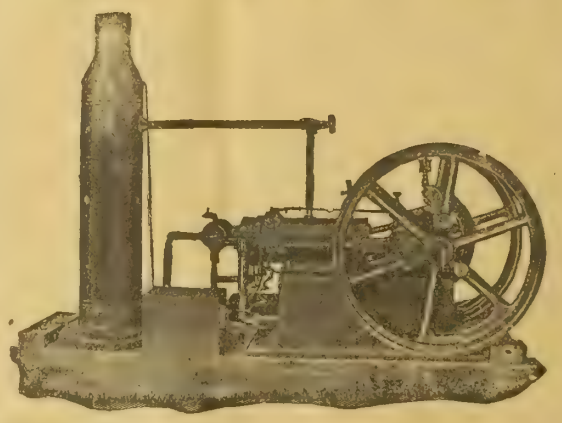
Every farmer's daughter and every farmer's wife knows

They all use it—for making delicious butter for their own table. They found out years ago that Windsor Butter Salt dissolves quicker, works in easier, and helps butter to keep better.

Windsor Salt is absolutely pure and every grain is a perfect crystal. 42

If you want to get "top" prices for your butter, use Windsor Butter Salt.

Farmers of Quality



Stationary and Mounted, in 1 1-2 to 30 Horse Power

Want Quality!

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of seating directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

In the Sheep Fold.

It is a great convenience to have a few hurdles made of light material with which to construct small pens in corners, where ewes having twins can be placed for a few days until they are able to follow. When the lambing season is at hand, they should be closely housed when cold, and when mild, not allowed outside of a yard connected with their stable. At this time the shepherd's vigilance is in demand, for a ewe that fails to raise at least one lamb curtails the profits.

A little attention at the proper time often saves a lamb. If one becomes chilled and unable to nurse, a sudden heating is almost sure to cause death. Use a piece of soft blanket, well warmed, and folded several times. Roll the lamb inside of it, leaving a breathing space. If possible, pour about a half ounce of warm milk into it. A bottle with rubber nipple attached is convenient for this. When this has been done, leave the lamb and its mother to themselves, and the chances are that in a half-hour the lamb will be on its feet.

When the lambing season is over, the ewes may be again in one flock, and a portion of the shed partitioned off, with a creep provided for the lambs to go through. A trough should be here with a sprinkling of bran in it. This the lambs soon learn to lick. Then whole oats should be added.

If the ewes are not receiving plenty of succulent food, the lambs should have a small addition of oil meal.

After all lambs have been dropped, the ewes should be clipped as soon as possible, keeping them from wet and cold winds, and in a few days a cold flurry does not affect them, and they thrive much better. The wool will have a more glossy appearance that it will later, when they are being reduced in flesh from nursing their lambs. It avoids their being soiled from their lambs trampling over them while lying.

Aberdeen-Angus Cattle for Sale.

In regard to Mr. John Richards' herd of Aberdeen-Angus Cattle which is advertised on another page of this issue it may be justly said, that some few years ago when it was at its best, it was undoubtedly the crack herd of Canada. Some years ago it practically swept the boards at the Toronto exhibition in the keenest competition of the breed that has ever been seen at this great show. Animals from Mr. Richards herd won distinction at Winnipeg and at all the leading shows in the far West. Mr. Jas. Bowman's, of Guelph, well known prize winning herd is largely made up of animals of Mr. Richards' breeding, and is regarded as one of the best herds on the American continent. This sale will afford a splendid opportunity to lay the foundation of a good herd of this excellent breed.

Reviving a Chilled Piglet.

Of all the means of successfully warming a chilled pig and restoring his interest in things earthly, probably there is nothing better than a pail or other vessel of water heated which his body and limbs can be submerged for 10 to 20 minutes. In to about 95 to 98 degrees F., in many instances it will well-nigh revive the dead. If after this hot bath Mr. Pig is dried and placed where he can suck a well-filled teat his outlook on the future will be much improved.

IHC WAGONS HAVE STOOD THE TEST OF ALL LOADS AND ROADS FOR YEARS

THE real proof of the strength, durabilit , and value of I H C wagons is what they have done and are now doing for thousands of farmers throughout the Dominion. Light loads and heavy loads have been carried by I H C wagons, over good roads and bad roads, for so many years that there is hardly a farmer who is not familiar with the high quality that these names on wagons represent—

Petrolia Chatham

Either of these should be your choice if you want to be sure of lifetime service. The quality in both is the highest possible—the result of years of wagon-building experience, and the use of the best materials, shaped by skilled workmen operating with the finest manufacturing equipment.

Petrolia Wagons are constructed of the finest quality wood stock which is thoroughly seasoned by being air dried. The ironing is of the very best. The inspection of each part is most rigid. Petrolia Wagons must be made so that they will live up to the I H C standard of excellence or they are never sent out of the shops.

Chatham Wagons have a long record for satisfactory service in Canada. Made with hard maple axles, oak bolsters, sand boards, rims, and spokes, and oak or birch hubs—they represent the highest standard of wagon construction. When you buy a Chatham wagon it is with the assurance of getting the utmost service and satisfaction out of it.

Be sure to call on the I H C local agent. Get a pamphlet. Let him show you one of these wagons. If you prefer, write for literature or any other information you want to the International Harvester Company of America at nearest branch house.

THE HORSE.

Sore Shoulders and Necks.

Sore shoulders are, as a rule, due to an improper fit in collar or hames. Occasionally uneven surface or hard, lumpy areas in the filling may be the cause, or improper care of the horse in early spring before the skin and underlying tissues have become hardened to the collar pressure. Diseased conditions of the foot or limb may cause sore shoulders from an abnormal gait.

A horse's collar should be fitted with greater care than a pair of patent leathers on an aggregation of bunions, corns and ingrown toe nails. Why? Because the horse has no means of making his pain known to the majority of drivers, while the wearer of the patent leathers can "grin and bear it," consoling himself with the thought that his understanding shows up well even if his face does wear a peculiar puzzling expression.

The collar should be well made with a fair amount of springiness on pressure, smooth, even surface, and adapted to the use required as for instance, a heavy collar for heavy draft work, while a lighter one can be used for driving horses. Let it be sufficiently long that the hand may be easily passed beneath the under surface of the neck and wide enough that the fingers can be just passed between the front border and the side of the neck.

This rule varies somewhat, of course, in the various types of horses, as some thick-necked horses expand the neck when drawing a load. These will require a slightly wider collar. Let the collar fit snugly over the entire bearing surface. Having fitted the collar next comes the fitting of the hames to the collar and the proper adjustment of the height of the attachment of the tug. A good rule to follow is to have it come about one third of the height from below. This may need to be varied somewhat as we consider the angle at which the hook passes from the hame and whether the horse has a free or check rein. In well made hames this hook passes out at a right angle and is easily adjusted. If placed too low the point of the shoulder shows abrasion and soreness. If too high the soreness will be found just in front of the upper part of the shoulder blade. Occasionally a sore neck results from this cause, but rarely if the collar is of the proper length.

When sores occur seek the cause, correct it, then aid nature in effecting a recovery. Having removed the cause wash well after each day's work and dust with any good antiseptic powder, or easier still, dampen well after washing, with a solution of bichloride of mercury and tannic acid. Dissolve two bichloride tablets and a tablespoonful of tannic acid in a quart of soft water for this purpose. It will keep for a week, costs but little and is easily applied.

Dusting powder made up of boric and tannic acid are equally effective, or zinc oxide may be used. Dry sulphur and air-slaked lime is a favorite mixture with some and is quite good.

See that each horse's collar is clean each morning before putting it on. If a sore is present, stop after a short time and remove the scab or granulations that may have accrued to the collar at that point.

Prevention is worth the proverbial amount of cure and consists in carefully fittted collars.

The use of pads is largely a matter of choice, and we are free to confess that in twenty-five years of experience in handling work horses we consider the arguments pro and con as about even. We have made it a rule to use pads only with the smaller and lighter collars when used in heavy work. Galled shoulders frequently result from the use of a sweat pad or one wet in a heavy rain.

Careful washing of the shoulders with some astringent solution during the first few days of early spring work toughens the skin, lessens the action of the sweat glands, in that region and gives many a faithful horse relief from the daily routine of a sore shoulder.

Sore necks in horses is due usually to one of two causes—a short collar, or to too great weight coupled with the side motion as noted in a two-wheeled vehicle. A horse can carry quite a heavy weight on the neck provided there is no jerking sidewise. Treatment is the same as for sore shoulders, remove the cause, then wash well and treat with an antiseptic and astringent wash or powder.

Treatment of Horses Corns.

A corn consists of an injury to the sensitive horn of the foot and the soft tissues beneath, causing at the same time a rupture of the small blood vessels. The escaped blood works through the horn of the sole, staining it a dark red color. The location of a corn is on the sole in the angle formed by the bar and wall of the hoof. The front feet are most usually affected, because they support about two-thirds of the weight of the body, and, also, during movement, the heel of the front foot is placed upon the ground first. Three kinds of corns are generally recognized, the dry, moise and suppurating.

The dry corn is recognized by the blood-stained horn and is not attended with excessive inflammation.

Moist corns are recognized by the large amount of inflammation, shown by the fluid accumulating in the region of the corn.

Suppurating corns are the moist corns which have become infected with pus germs.

Among the causes and conditions which predispose to corns may be mentioned too excessive thinning of the sole in the region subject to corns; high heels; too much removed from the frog and bars; too short shoes, which allows the foot to project over the heels of the shoe, thus giving no support to the structures above; wide feet with low heels are easily bruised, causing corns; allowing shoes to remain on the feet too long; a shoe improperly applied to the foot so as to rest upon the sole and bruise it.

Symptoms of Corns.—The dry corns generally go unnoticed. The first symptom of a moist or suppurating corn is pain. In many cases of corns in old horses the corns have existed for such a long period that the animal has become accustomed to the slight pain. However, they are restless and may paw their bedding behind them at night. Sometimes the first that is noticed that may arouse suspicion of a corn is that the horse will not travel as freely as usual. Then lameness develops, which will not improve by exercise. While standing, the affected foot is advanced so as to relieve of all weight. When a suppurating

corn exists the lameness becomes severe. The hoof over the horn is hot and painful under pressure. If a suppurating corn is neglected, pus may be seen escaping at the top of the hoof. With a suppurating corn a horse suffers the greatest pain just before the pus escapes, then goes sound after the pus is removed; lameness returns with the accumulation of pus.

Treatment of Corns— Whenever possible, remove the cause of the corn. The sole should be examined thoroughly to determine the extent and nature of the corn.

If a suppurating corn is present all the sole underrun with pus should be removed. Then apply a pack of 1-1000 bichloride and keep moist with this solution for three or four days. Then pack the corn with white lotion for three days. The horse should then be shod with a bar shoe and all pressure taken off the wall in the region of the corn.—C. L. Barnes, Colorado Agricultural College.

Let Your Horses Work in a Rational Way.

The coming circuses revives the oft repeated question of how do these traveling shows keep their horses looking so slick? As it is well known they are obliged to do their work under the worst conditions, sleeping at night standing with their heavy harness on and always obliged to work in all kinds of weather, sick or well, and look as though they were the inmates of a private stable, where their owners personally superintended doing them up in oil papers every night. Surely there is a mystery about the business somewhere.

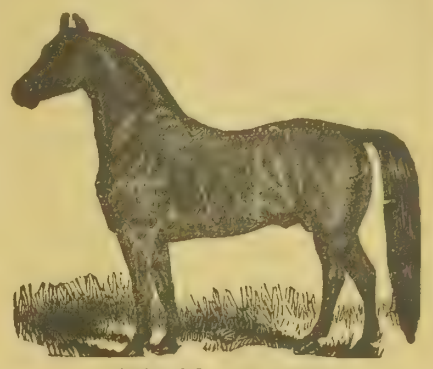
Perhaps we are mistaken but we fancy we have discovered why these horses and others that are obliged to haul heavy loads long distances at a good rate of speed are always in the pink of condition, and never show any signs of fret or worry. The discovery came to us all unexpectedly and wholly unsought, for we have years ago given up all hope of having the question answered by any one intentionally, especially any one connected with the horses referred to. The secret came out in this way. While unloading the great Barnum circus in Portland some of the town teams bringing supplies to the grounds got mired and the more the drivers lashed them the less they tried to start the load. One of the managers seeing the difficulty rushed to the rescue and recommended that the whipping cease. Then he sent for one of his own teams to hitch on and pull the load to its destination, but before he left he told the driver of the discouraged team that the trouble with his horses was that they had lost confidence in the one that they ought to look to to help them out of their troubles. Getting warmed up with his subject he remarked that the pair of horses had been whipped more than all the horses in the great circus had been punished for years, and more than they would be punished for years to come with his knowledge. No groom or driver would be retained for a moment if he was known to strike a horse in anger or even to worry an animal by nagging him as so many drivers do. Here is the secret of fat, sleek looking horses in a nutshell. It is not hard work or the inclement weather that makes the bones show or the head droop, nor even somewhat limited rations for brief periods but rather the incessant worrying and fretting that so many drivers indulge in at all times, often unwittingly. A good horse will do an immense amount of work if given a chance to do it, in a rational way.

Horsemen Attention !

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as, Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING.

CURES:
SPLINTS,
CURBS,
SPAVINS,
ENLARGEMENTS,
COUGHS,
COLDS,
DISTEMPER,
GLANDERS,
FOUNDER.



AFTER USING.

Use this preparation thoroughly for all and every disease of the horse for which it is recommended, Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on its merits, you will be compelled to endorse it.

TESTIMONIALS :

DEAR SIR :—I had a mare which had a very bad cough and heaves for almost six months, and became so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it.

Very truly,
RODERICK McKENZIE.
Hillsboro, N. S.

DEAR SIR :—I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contraction of the hoof.

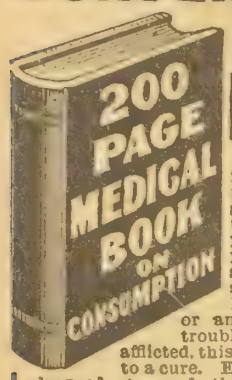
Consumption Book FREE



This valuable medical book tells in plain, simple language how Consumption can be cured in your own home. If you know of any one suffering from Consumption, Catarrh, Bronchitis, Asthma or any throat or lung trouble, or are yourself afflicted, this book will help you to a cure. Even if you are in the advanced stage of the disease and feel there is no hope, this book will show you how others have cured themselves after all remedies they had tried failed, and they believed their case hopeless.

Write at once to the Yonkerman Consumption Remedy Co., 1641 Rose Street, Kalamazoo, Mich., and they will send you from their Canadian Depot the book and a generous supply of the New Treatment, absolutely free, for they want every sufferer to have this wonderful cure before it is too late. Don't wait — write today. It may mean the saving of your life.

POULTRY.

Buying a New Gobbler.

The best time to buy a new gobbler, writes Mrs. Millie Houaker, especially if a good bird is wanted, is in the fall, before the flocks have been thinned. This is true whether one is to buy of a neighbor or of a distant breeder. The Thanksgiving market usually claims the best of home flocks, and forethoughted turkey raisers early take the best or what breeders have to offer. It is the largest and best developed of the young gobblers, together with such old ones as are no longer needed, that go first, and it is from these that one should aim to buy. To put off buying until later is to take, usually, one too late or small to sell early of home flocks, or what others have left of breeders. To wait until spring is usually to have to take a late hatched, immature bird, often one too immature, or otherwise altogether unfit for breeding purposes.

But this is not the only objection to buying late. Turkeys, especially when moved far, do not take easily to new surroundings, and when bought late are often a disappointment, at least so far as early poults early flock from a late bought gobare concerned. One rarely raises an bler, and seldom a large flock. When bought in the fall they are fully reconciled to their changed conditions before the breeding season begins, and strong, early poults may be depended on.

Then, too, prices are usually lower in the fall. A first-class bird may be obtained then for less than an inferior one in the spring, and both breeder and buyer are better satisfied. The breeder is anxious to sell and dimish his flock, and is willing to make prices that will insure quick sales. In the spring he has only a few left and a rushing demand at hand, so puts prices high—much higher as a rule than quality justifies. Three or four dollars is worth saving, and especially when it means a gain in quality, and greater surety of a profitable crop.

Those who buy of home breeders should visit the flock and make their own selection. Size and early development should be the first principle of selection. Unless a bird of special type is wanted the scales may well be the main test of fitness. The larger of two birds of same age is the better as such a one has made quicker growth and better weight, and means earlier development and better size in the future crop, but where such a bird has any physical defect another might be better in the end. One with sore eyes or showing any tendency to roup, or one with a lump on the toes or any other part of the feet should be rejected. Roup is a contagious disease, often hanging on long, but usually fatal in the end, and lumps on feet often mean cancerous abscesses. Likewise, where pure bred turkeys are raised any strikingly different in any respect should be avoided. An open lot, true to type and breed, is always more saeisfactory to the raiser, and even on the common market will often command better prices. And where sold largely for breeding stock such a lot will bring much more.

When a bird is to be bought of a distant breeder, unless one knows the breeder and his flock well, it is advisable to correspond with a number in regard to what they have to offer. Age, individual weights and line of breeding should be requested. The right kind of a breeder will answer all questions cheerfully, describe certain individuals likely to suit and state exact age and weight. It is not then a difficult matter to make a selection, and to obtain a good bird. Here as before, size, age considered, should be the main point. Everybody wants big turkeys, and the earlier age at which they grow them the better, so where turkeys are to be grown to sell in turn for breeding stock, big sires are no less important than where grown for the general market. But a little more care should, perhaps be exercised in regard to other points. Shape, carriage and plumage are more or less insistently demanded and must be supplied. But unless one is breeding for show purposes they may to a certain extent be considered of minor importance.

One should not expect to get a bird of high quality at a low figure. Quality means money to the purchaser, and the breeder is justified in asking an extra price for it. It has cost him to produce it and he should have its worth. As a rule price may be taken to mean quality as with other things. Not that one should pay exorbitant prices, but rather that one should not buy a cheap bird and expect a good one. Nor should one haggle over price once a good bird is found.

As to buying an old gobbler, that should depend largely on what may be obtained in a young. As a rule a gobbler more than two years old is not very satisfactory, and I would not ordinarily advise buying such a one. However, in case one has only young hens and those rather late, it might be better to buy an old gobbler than a young. But I would try to get one in no more than his second year, at the outside no more than his third. Here, as with a young, size should count most and a fair price be willingly paid.

The Fowls' Drinking Water.

The importance of a plentiful supply of pure water for live stock cannot be over-estimated. To quench thirst is not the ultimate end nor only purpose of water. The desire that is created for drink is occasioned by a feeling termed thirst, similar to a desire for food through a sensation of hunger. These are only the demands of the inner being, the act of satisfying such only a physical exertion, while the article drank enters into the composition of the blood, bone and flesh, maintains a greater percentage than other component parts and is one of the essentials of life.

In a pure state, water (as it is in-

The Deering Binder Picks up Down and Tangled Grain

On the Deering Binder the guards are so placed that the machine can be tilted to cut close to the ground without pushing trash and stones ahead of the knife. This means that the Deering Binder picks up down grain.

The Deering Reel can easily be adjusted high, low, forward, or backward, to save grain in all conditions, short, tall, standing, down, or tangled. It can be shifted quickly to push short grain and green undergrowth from the guards to the platform canvas.

The Deering Binder is equipped with a third packer. It reaches up close to the elevator and pulls down the grain to the other two packers, preventing choking at the top of the elevator. The new Deering breast plate is designed to permit the needle to enter without pulling straws through the breast plate on to the bill hook. This also eliminates choking at this point.

The third discharge arm is a very effective aid in throwing out the bound sheaves and assists in separating the tangled grain of the bound sheaves from the unbound grain on the binder deck. The binder shifter lever is directly in front of the driver, and convenient to operate.

There are many other features of Deering Binders which you ought to know about. The Deering agent in your town will tell you all the facts. If you prefer, write direct to the nearest branch house below for catalogue. Deering mowers, rakes, and other harvesting and haying machines and tools are as efficient as the binders. Ask to see them.

Carlton Automobile and Supply Co., Woodstock, N. B., Agents.

dispensable) sustains existence, while if impure, it, like a poison, affects the entire system, occasioning many diseases that are attributed to other causes through the attachment of, so little importance to the vital necessity of using the pure aqueous fluid. Pure water may be considered just as essential to life and growth as is pure air. And upon the advantages of a free circulation of air medical authorities have written volumes, attributing so much to it as to believe a lack of it sufficient to make a person sick, cause death, alter body and mind, while with water the influence must be decidedly greater.

The tendency of water to absorb noxious effluvia is one great reason why it becomes unfit for drinking purposes after standing close to such impurities. And there is no greater source of unhealthfulness than when there is allowed to accumulate decayed vegetable matter or animal excrement, particularly with that of the feathered creation.

All gaseous contagious matters are substances in a state of decomposition and water in the presence of such gases, being an absorbent, soon becomes turbid, or so to speak putrifies by the process of decomposition, which is completed in the water. It so remains unchanged, unless subject to the filtering process it undergoes in the earth, when vegetation, having a strong affinity for such gases, extracts them from the water, and it again becomes pure and fit for drinking purposes.

Furthermore, the vitality and productive qualities of live stock are increased or diminished through the effects (resulting from the nature) of the article which becomes the means of their productiveness. In an egg, for example, the white contains 53, the yolk 79 per cent. of water, and it reasonably follows that the quality of the egg is dependent upon the nature of its largest constituent parts.

Small bodies of water when left exposed to the sun's rays, lose their freshness and satisfying qualities, and with fowls there is either too much drink, causing intestinal diseases, or too little to enable a sufficient moistening of their food to ensure a proper digestion. Either of these retards the functions of the organs, and interferes with the health and profit of the stock.

Vessels used in watering stock should receive a proper cleansing before being used a second time; if not, any impurities that may remain in the previous surplus supply, or that may adhere to the sides of the vessel, will taint the fresh water, and in time cause a smell that will be objectionable.

Rain-water should not be permitted to accumulate so as to be accessible for drinking purposes for stock. It contains the impurities of the atmosphere, which, being very acceptable and beneficial to plant life, are just the contrary to animal existence

It is the belief of the writer that many of the diseases incident to poultry are due to neglect in providing them with pure water. Particularly does he believe such to be the case in the majority of instances where chicken cholera prevails. One writer has attempted to account for the contagious nature of this and other fatal distempers, by saying that unhealthy fowls will impart to the water from which they drink their particular disorders and that other fowls that may drink afterwards become similarly affected. This, however, is not accountable for the first cause or origin of suc fatalities, but the infection of such diseases could reasonably be imputed to the vitiated state of the water consumed.

The omission to furnish fowls with suitable drinking water is one of the worst features of cruelty to animals. It is a neglect that is decidedly adverse to success, hence it tends to diminish individual fancy fowls, and works detriment to the poultry interest. Those who are occasionally heard to say that "There is no profit in poultry," are not qualified to have the management of the same, and in their attentions may be classed with the thriftless persons who keep fowls that get drink when it rains.

Let every owner of live stock, among other attentions, see that such are supplied with a sufficient amount of pure water, and they will not have occasion to regret that the said stock are not as profitable and thrifty as they might be.—Poultry Gazette.

FORCING THE MOLT.

The principal advantage in forcing the molt is to get the hens ready to lay before cold weather. With proper care thereafter they will lay all winter. This is all right for egg production when prices are high, but I do not care to have breeders lay much during the winter, as the fertility and strength of the eggs during the hatching season seem to be weakened by such practice. For forced molting I feed sparingly two or three weeks in the latter part of July or early in August; then feed heavily on corn and sunflower seed until the feathers are gone and new ones have taken their places. The hens need to be confined with plenty of shade during the process, as letting them out in the hot sun burns the skin, which is some times exposed over almost the entire body.

Poison for Poultry Pests.

Do not place poisons where fowls, other birds or domestic animals can get them. Barium carbonate is one of the cheapest and most effective poisons. One part of this poison may be mixed with four parts of corn meal, flour, or finely cracked wheat, in the form of a stiff dough. It may also be used upon toasted cheese or moistened toasted bread. Use only a small quantity, a teaspoonful at a place.

Strychinne kills rats too quickly for use around houses, but is a good poison outside.

Strychnia-sulphate ....1 oz.
Borax ....½ oz.
Water ....2 qts.
Cracked wheat ....½ bush

Dissolve one ounce strychnia-sulphate in two quarts boiling water, to which has been added one-half ounce borax (this prevents moulding). To this add one-half bushel cracked wheat, coarse bran, or other rough feed. When the grain has taken up all the water, roll it in a mixture of flour and sugar, using two pounds sugar to ten pounds flour (this will conceal the bitter taste of the strychinne). Place in runways or feeding places. Protect from other animals by partially covering with boxes or cans.

Do not use phosphorus; it is too dangerous on account of fire.

Systematic organized destruction of rats, in which every person in the community enters, will always keep the rats down in a locality, and sometimes almost exterminate them. —Prof. E. G. Titus, Utah Experiment Station.

THE FARM HOME

mill that stood by it, The bridge and the rock where the cataract fell.
dai-ry-house nigh it, And e'en the rude bucket that hung in the well.
hands that were glowing, And quick to the white-pebbled bot-tom it fell.
truth o-ver-flow-ing, And dripping with coolness, it rose from the well.

3 How sweet from the green, mossy brim to receive it,
As, poised on the curb, it inclined to my lips!
Not a full blushing goblet could tempt me to leave it,
Tho' filled with the nectar that Jupiter sips.
And now, far removed from the loved habitation,
The tear of regret will intrusively swell,
As fancy reverts to my father's plantation,
And sighs for the bucket that hung in the well.

A book containing the words and music of twenty-six beautiful old-time melodies, will be sent to any address on receipt of 10 cents by Clark Bros., Moncton, N.B.

A Mother of Six.

Mrs. Tewilliger stood at the door of her small photographic studio exchanging some parting words with a gentleman who carried in one hand a leather sample-case, and in the other his hat. Putting this on with a flourish and turning suddenly to go, he came near upsetting a small woman who was passing by and boYing to the other in the doorway.

"Why, how-de-do, Mrs. Pike?" exclaimed Mrs. Tewilliger, when she saw her. "Ain't you comin' in?"

"Well, mebbe I will in a few minutes, if I won't interrupt your work.'

"Of course you won't, not a mite! That is, if you'll let me go on with it," she laughed. "Jest come right back in the gallery. You see, I've got some prints in the frames, an' I do want to git all the benefit of this sun I can. It's been cloudy so long, I've got away behind. Seems sometimes that when people want to work an' need work the most, the Lord won't let 'em till he gits ready. Teaches us patience, I suppose; though I most think poor folks gen'ally has a bigger supply of that than anything else. I do hope you'll excuse the looks of this gallery—the children been playin' in here. I let 'em come in sometimes, when they ain't nobody here. No, take this chair, Mrs. Pike; that other is a patent lowerin' an' raisin' concern, an' sometimes it let's you down unexpected."

"Was that young man I met coming in, a customer, Mrs. Tewilliger."

"No, that was the gentleman who travels for the house where I buy my supplies."

"Your supplies?"

"Yes; plates—paper—everything I use in takin' pictures, you know. And, ah, Mrs. Pike! what do you suppose he's been tryin' to git me to do?"

She was busy at the window where, on a narrow shelf outside, was ranged a line of tilted printing frame which she seized in turn, stripped off their prints and charge with fresh paper. Now she turned to her friend with an expression half-sheepish, half tickled, like that of a child.

"Do tell me."

"Well, there's to be a photographic Convention at Columbus two weeks from tomorrow, an' photographers from all over the State will take their pictchers and try for the prizes." She broke down in a deprecatory laugh. "I jest threw up my hands and said, 'Law, man! what would I do with my six children?"

"Now, Mrs. Tewilliger, if you want to go to that convention, you know that some of us will look after them."

"He said I could learn more in three days there," went on Mrs. Tewilliger, ignoring utterly this kind offer, which neither lady considered on that account to be the less appreciated on the one side or binding on the other—the graces of gentle breeding dwelling on in Jefferson Center—"he said I could learn more in the three days there than in three years struggling along here by myself. I told him how bad I wanted to learn; how with six little children to raise I must git more business. An' he said—now what d'e think?—that if I got a medal, it would be a great big advertisement for me, an' I could hang it up against a piece of red plush in my show case for the whole town to see, so's everyone would be proud of me. Oh, psaw! the idea of me gittin' a prize!"

Two little spots of red, which had come to her cheeks in the excitement of her talk with the salesman, still burned; and nervously her fingers pressed the brass spring of the frame she held, out and in, out and in.

"Well, and why shouldn't you?" said her friend. "I think you take lots prettier photographs than the 'Palace Parlors.' Everyone says you always get your eyes so beautiful and clear. They just blossom!"

"Mr. Cochran said I'd ought to run that 'Cheap John," as he calls him, out of town; an' that I could, too, if I went to the convention an' got a medal. For then everyone would be sure to think I was better than him, even if I am a woman."

At this point, and from an adjoining room, broke out a baby wail.

"I declare! I wonder you have the courage to keep the business going," said Mrs. Pike.

"I don't know how else I could make a livin'. With six little children to feed an' clothe, and her husband dead, a poor widow has to do sumpin' mighty quick—Tillie!" she called, "Alfred's woke up; don't you hear him cryin'? Run an' take him up! Of course, helpin' Peter around in his gallery, I picked up a little about the business; an' after he died, I jest didn't know what better to do."

"Let's see; he's been dead nigh on to a year, hasn't he?"

"Ten months, an' over; its been a hard pull. Now, Georgie, what do you want?"

"Me hungry."

"Mammy's too busy to go now, Tell Tillie to give you a piece of bread."

"Tillie's getting to be a right smart sight of help, isn't she?"

"She is so," responded the mother, warmly. "I don't know how ever I'd git along 'ithout her. If she is but thirteen, she looks after the children noble. But she wants to go back to school, next winter, an' so does Mary; an' what with all the shoes to buy it seems like I jest got to git more business.

"Well, why don't you go to Columbus?" said Mrs. Pike, eyeing a section of papermache fence and thinking her Annie would make a lovely picture leaning her elbows on it, in a short-sleeved dress. Annie had pretty arms.

"Laws-o'me! I ain't never been so far away from home in my life. It's about thirty miles, ain't it?"

"Yes; dollar eighty-five the round trip. Georgie's trying to pull the lamp off the table."

"Georgie! didn't I tell you never to tech the lamp. Go right out in the kitchen now, for a bad boy. An' tell Tillie to be sure and give Petey his cough mixture. How I ever could leave those children, I don't see! I wouldn't never think of it for a minute, if it wern't for the hopes of gittin' a prize. You see, I'm relyin' altogether on what Mr. Cochran said—as nice an' pretty-behaved a young man as you'd want to see!—an' he as much as told me there was no doubt but what I'd git a prize. wn' he sold me considerable stuff, too; of course, I'd have to git some fine cards to show off my pictchers in the exhibition. But oh! wouldn't the children be proud! And wouldn't Peter, if he could only know? If he could only know—I was doin' my best—by the children!"

The light of hope faded suddenly from her eyes—the flush from her cheeks. To the luxury of woe she would yield, however, the passing moment only; and she fronted its successor as before, with the courage born of desperation.

"But there! to think of me run-

THAT AWFUL BACKACHE

Cured by Lydia E. Pinkham's Vegetable Compound

Morton's Gap, Kentucky.—"I suffered two years with female disorders, my health was very bad and I had a continual backache which was simply awful. I could not stand on my feet long enough to cook a meal's victuals without my back nearly killing me, and I would have such dragging sensations I could hardly bear it. I had soreness in each side, could not stand tight clothing, and was irregular. I was completely run down. On advice I took Lydia E. Pinkham's Vegetable Compound and Liver Pills and am enjoying good health. It is now more than two years and I have not had an ache or pain since I do all my own work, washing and everything, and never have the backache any more. I think your medicine is grand and I praise it to all my neighbors. If you think my testimony will help others you may publish it."—Mrs. OLLIE WOODALL, Morton's Gap, Kentucky.

Backache is a symptom of organic weakness or derangement. If you have backache don't neglect it. To get permanent relielf you must reach the root of the trouble. Nothing we know of will do this so surely as Lydia E. Pinkham's Compound.

Write to Mrs. Pinkham, at Lynn, Mass., for special advice. Your letter will be absolutely confidential, and the advice free

SHE HAD CONSUMPTION.

Dr. Wood's Norway Pine Syrup Cured Her.

Weighed 135 Pounds—
Now Weighs 172.

Mrs. Charles McDermott, Bathurst, N.B., writes:—"I thought I would write and let you know the benefit I have received through the use of Dr. Wood's Norway Pine Syrup. Three years ago I had consumption. I had three doctors attending me and they were very much alarmed about my condition. I was so weak and miserable I could not do my housework. While looking through your B.B.B. almanac I saw that Dr. Wood's Norway Pine Syrup was good for weak lungs, so I got a bottle at the drug store, and after taking ten bottle I was completely cured. At that time I weighed 135 pounds and now weigh 172, a gain of 37 pounds in three years. I now keep it in the house all the time and would not be without it for anything, as I owe my life to it."

Dr. Wood's Norway Pine Syrup contains the lung healing virtues of the Norway pine tree, which, combined with other absorbent, expectorant and soothing medicines, makes it without a doubt the best remedy for coughs, colds, bronchitis and all throat and lung troubles.

Price 25 cents at all dealers. Beware of imitations. The genuine is manufactured only by the T. Milburn Co., Limited, Toronto, Ont.

nin' on this way! Jest like's not I'd never git a prize."

"Now, don't you go to feeling that way," said Mrs. Pike. "Mr. Cockran knows; and if he said you would, you ought to go and get it. I'll spread it 'round about your going all I can; and mebbe Mr. Jefferson will put it in 'Local Happenings.' Then, when you come back, everybody will want you to take their pictures. There! I guess you've got a customer coming now. I must go."

"Don't hurry, Mrs. Pike. Georgie, you and Lena must run out, now, with that bread; Mammy's goin' to take a pictcher—Well, I'll think over what you've said, an' if I feel it's my duty to go, I will."

But it seemed a colossal undertaking.

"Dollar eighty," she pondered; "an' I've laid up only about that much all summer, 'gainst the children's shoes next winter. If I use that to go to the convention, then don't git a medal, the Lord knows what I'll do! But I can't make a livin' the way I been doin'; an' truth is, seems like I've come to a corner and don't know which way to turn. Oh, Peter, Peter! if you was only here to help me turn the corners! You told me to do the best by the children, an' please God, I will, if I

But at last she selected her best photographs with careful discrimina- can only jest turn the corners!"
tion. She felicitated herself upon their sharpness and accuracy. "You can count every tuck in that baby's dress," she soliloquized, "an' most every hole in the embroid'ry, too, if you got the time. They ain't the least blur in 'em anywhere." Placed upon the new cards, the bill for which renewed the qualms she had felt when she ordered them, they presented so brave an appearance her heart swelled with pride; and she was persuaded that all her hopes and prayers and sacrifices were not to be in vain. In due course the convention doors admitted her.

During her first tour in the rooms she passed the line of exhibits in more or less of a daze. "Ain't they beautiful? Oh, ain't they beautiful? I never dreamed there could be such photographs!" This was the refrain of her thoughts, over and over. She passed her own offerings, scarce consciously until, at the second round, they caught her eye with a sort of shock.

For one dismayed moment she shrank, and glanced hastily from side to side with a blind instinct to escape from them; then her brave eyes traveled over them slowly—critically. They seemed like different pictures entirely. To her recreated vision, full of the soft effects of light and shadow and draperies she had been enjoying, they now looked hard and flat and stiff.

"They don't stand no show—they don't stand no show," she whispered "Pretty good joke on me, ain't it? not knowin' how bad they was." She met Mr. Cochran while the cold, sinking feeling still held her.

"Well, well, Mrs. Tewilliger! You here? What do you think of the pictures?"

"Y-e-s! that was a pretty good play you put up on me, wasn't it?" she laughed, "tellin' me I could get a prize!"

"Now, I'll tell you. I had no idea there would be so many fine pictures exhibited here. I hadn't really. He looked at her and held his face and eyes steady. He was a valuable man to his employers.

"Well, now I'm here, I'm going to git all the good of it I can, anyway."

"That's it! That's it! If at first you don't succeed, you know!"

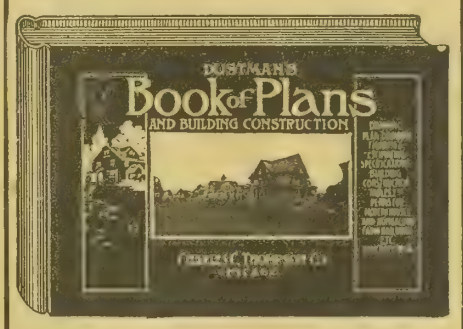
Dustman's Book of Plans

—AND—

BUILDING CONSTRUCTION

By U. M. DUSTMAN
(Licensed Architect.)

10,000 sold in 30 days



Price, $2.00 Prepaid

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an authority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns, farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS

General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying Out a Building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows, Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barnes, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions for Mixing and Placing Concrete—Proportions—Sand and Gravel—Itemized List of Material Costs—Writing of Specifications.

This book will be sent, together with a year's subscription to The Maritime Farmer, to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscription. If you are not already a subscriber and want the book, you may obtain it and The Maritime Farmer for $2.00. These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

The Social Side of Farm Life.

Mr. President and Members of the Farmers' and Dairymen's Association.

The subject I have been asked to take up and say a few words on is, as you will notice by the programme, The Social Side of Farm Life, and I hope the few remarks I may have to make may bring about a profitable discussion at this meeting.

Webster defines "Sociability" as "ready to unite in in a general interest, free or ready to converse, friendly, familiar fellowship," and it occurs to me that this definition is very applicable to this present Farmers' and Dairymen's Convention, particularly in the definition "ready to unite in a general interest," and as applied to agriculture it might mean co-operqtion.

We are here to unite in general interest.

I am going to divide my remarks under three headings, Sociability in the Home, Sociability in the Dairy Stable, and with the Animals, and Sociability With Our Neighbors.

SOCIABILITY IN THE HOME.

Sociability and Hospitality are so closely related in connection with farm life, that what may be lacking in sociability is more than accounted for by the real, the genuine hospitality that we find in our rural homes. Who is there among our city friends and relations that do not look forward to that visit to the country—to enjoy nature, the green fields and the babbling brooks and the gathering around the open fireplace to listen to the stories of the good olden time that our grandfathers and grandmothers loved to tell us about—of the "wood frolics," the "barn raisin'," the "corn husking parties," etc. To many of us in this meeting these pleasant gatherings are fresh in our memories.

But a newer day is surely coming in—a day full of new domestic arts. We are not going to adopt city ways; we have no need in the country for three changes of dress in a day, afternoon bridge, or 5 o'clock tea. We want to enjoy the simple life. Refinement will mark the coming home, not style and show, but that spirit of order and enlightenment which comes from the right sort of culture. The education along domestic and other lines that we give our boys and girls at our consolidated schools should be a strong factor in bringing about this social idea in our coming homes. Would to heaven we had such a school established in every county in New Brunswick. I believe it would largely tend to place agriculture on a better footing in our fair province, for I believe the future agricultural prosperity of our province depends on the Consolidated School. Our farm boys and girls are not developing as fast as they should in the little old, in some cases dilapidated, "red school house on the hill" and when we look back at the long list of eminent professors, lawyers, doctors, politicians, etc., that were born and brought up on the farms and have gone from the farm home and made their mark, surely, in this modern age, we should be more earnest in securing the better opportunities to be afforded by the Consolidated School.

Cecil Rhodes, in writing of education and the softening influence of learning coupled with religious education, says: "In the education of our people lies our only hope of killing race difference."

The old farmhouse has its interesting memories, but in some ways the new country home is more interesting. It will have its bath room, water running into the kitchen, good drainage, a library, a piano or organ, and a telephone. The first aim of the household is to secure health. We shall live out of doors and we shall know how to gather about us more liberally what nature and art offer to make life sweet and wholesome.

Perhaps I am wandering a little from my real subject, but the beautifying of our homes, the floer garden, well kept hedges, the cultivation of ornamental trees, etc., all form a very strong part of our social farm life. A magazine writer says: Forestry also comes within the circuit of the homemaker's work. Windbreaks will be made more of as the wilderness is swept away. Let Nature have a free hand along her lines and plant defences against the storms. We may prefer her mixture evergreens and wild cherries, or we may choose to plant a wall of crab apples fronted with honeysuckles. Everywhere there is country art, for Nature herself is pre-eminently an artist. You will fail of making a country home if you fail to appreciate the art that is contained in all the life about you. A robin's nest is simplicity itself, but whoever saw a nest full of those blue eggs, so per-

You Can Get This Gramaphone on

FREE TRIAL

We will send to any responsible person this Victor Gramophone and twelve selections for an absolutely free trial. We do not ask any money down or in advance. There are no C. O. D. shipments, no papers of any sort to sign. Absolutely nothing but a plain out-and-out offer to ship this Gramophone and the selections mentioned on a free trial so that you can hear it and play it in your own home. There is no catch about it anywhere. If you stop and think a moment you will realize the high standing of this firm would prohibit anything except a straight, forward offer.

ALL YOU NEED DO

All we ask you to do is to invite as many as possible of your friends to hear the wonderful Victor Gramophone. We feel certain that out of the number of your friends who will hear your machine there will be at least one and probably more who will want a Victor of their own. If they do not, if not a single one of them orders a Gramophone, we will not blame you in the slightest.

IF YOU WANT TO KEEP

If you wish to make the Gramophone your own, you may do so, but it is not compulsory. This is a free trial. You may send it back at our expense if you wish. We won't be surprised, however, if you wish to keep the machine after having it in your own home. If you wish to keep it, either remit us the price in full, or if you prefer, we will allow you to pay for it on the easiest kind of payments.

OUR EASY PAYMENT PLAN

There are so many people who really want a Gramophone, but who do not have the ready cash to pay for it all at once, that we have decided on an easy payment plan that gives you absolute use of the Gramophone while making small weekly or monthly payments. Just sign your name and address on the coupon now, and mail it to us to-day.

fect in color and in form, without a shout of joy and a thrill of gladness? In their city studios they have no color masters like a bed of roses. Jenny Lind could not quite equal the catbird and the meadow lark. The bees in their hives are able to beat the best architects.

SOCIBILITY IN THE DAIRY STABLE AND WITH THE ANIMALS.

To help solve a good many problems in connection with our farm life, there is one thing that should appeal to the average farmer and make the work of the farm more pleasant and congenial, and that is the proper care of our farm animals. If we can picture in our minds a real up-to-date dairy farm with all the modern conveniences and so laid out that the labor of this work is a pleasure, I think you will agree with me that it is one of the pleasing features of this branch of our farm work. The labor questions on most farms is a serious problem and gives rise to more discontent than anything else, so to my dairy friend I would like to make an appeal that if we want to lighten and lessen this labor, let us be more systematic in our work. We must admit that if a thing is worth doing at all, it is worth doing well, and if we have not time to get sociable with the dairy cow and other farm animals let us begin now. The same things apply to our field work. The growing of better crops. The planning of our farm work more systematically. All this tends to make the work more agreeable and will help to solve the question "How we can keep the boys on the farm." This season of proficiency for our seed fairs suggests sociability. The gathering around the lecture table with a white cloth covering it on which is spread the grains, selerting the large plump seed for our seed time—all means that we are aiming at something better. The harvest season brings the selecting of our seeds, the offering of prizes, etc.

SOCIABILITY WITH OUR NEIGHBORS.

The forming of Farmers' Clubs, the exchange of ideas, discussing farm life personally, the formation of agricultural societies in our neighborhood, all these tend to more or less sociability with our neighbors, and where this feeling exists we are sure to find a prosperous and up-to-date lot of farmers.

Mr. Chairman, the profession of agriculture is one of the grandest professions and should we not be possessed of it and by the examples we set our boys and girls on the farm, we can hand down to them no grander heritage.

Paper read by Geo. E. Fisher, of Chatham, N. B., before the recent Farmers' and Dairymen's Convention, at Fredericton, N. B.

Military Drill and Physical Training

Judging by the numerous enquiries received by the Local Secretary of the Summer School of Science at Fredericton, respecting the courses to be given in these two subjects during the coming summer, it appears that some confusion exists in the minds of many teachers with regard to them.

The course in Military Drill is for males only, and is open to teachers or prospective teachers who wish to qualify for the organization and instruction of cadet corps. The course lasts six weeks, and takes up the whole time of those who enter upon it.

The courses in Physical Training are open to teachers of both sexes, and consist approximately of thirty lessons of one hour each, usually spread over three weeks. At the conclusion of the course, a certificate is granted by the Militia Department The Chief Superintendent of Education announces that in order to obtain a teacher's license in this Province, it is now necessary to have this certificate. Also, that after the end of the present year, all teachers must possess it to obtain advance of class, and, further, that at the end of four years from the same date, all schools must provide Physical Training by qualified instructors.

The Summer School of Science affords an excellent opportunity for teachers to obtain this certificate, and at the same time to qualify for better positions in their profession by improving themselves in other subjects by means of the classes in Science, Nature Study, Drawing, Literature, Handwork, etc., from July 13 to August 2, in Fredericton.

Application for admission to the Course in Military Drill must be made to the Chief Superintendent of Education, and for the Summer School of Science to the Local Secretary, Fredericton.

Scripture Cake.

Some diligent reader of the Bible gives the following directions for making this cake, which I have seen in print only once. Butter, one cup, Judges V, 25; flour, four and one-half cups, I Kings, IV, 22; sugar, three cups, Jer. VI, 20; raisins, two cups, I Sam. XXX, 12; figs, two cups, ditto; almonds, one cup, Judges, X, 25; honey, one tablespoonful Ex. XAI, 21; salt, one pinch, Lev. II, 13; spice ot suit taste, I Kings, X, 10; leaven, two tablespoonfuls of cream of tartar, and half as much soda, Ex. XII, 15; Cream egg and sugar together. Separate the yolks and whites of eggs and beat till very light. Reserve half a cup of the flour to mix with the fruit. The above quantity of ingredients will make two large cakes or one small one and eight or ten cup cakes, which are called snowballs when iced.

Amatite ROOFING

"THIS IS THE ROOFING THAT NEEDS NO PAINTING"

AMATITE means more to the man who needs a roofing than just merely something to put on the top of a building.

It means a thoroughly satisfactory and reliable roof covering, without future *expense for painting*—because the *real mineral surface* makes painting unnecessary.

Frequently the cost of painting a roofing amounts to almost enough to buy a new Amatite Roof.

Amatite can be laid right over shingles, tin or other ready roofings. The directions hold good for laying Amatite anywhere and over anything, and are as simple as A B C.

For further information, booklet, samples etc., address nearest office.

Everjet Elastic Paint

A very tough, durable paint at a low price. One color only—a lustrous black. Use it for machinery, heating apparatus, smokestacks, roofs, fences, water tanks, etc.

Creonoid *Lice Destroyer and Cow Spray*

Cows give more milk if sprayed with Creonoid to keep away the flies which make them restless. The poultry output will be increased if the hen house is made obnoxious to insect pests by disinfection with Creonoid.

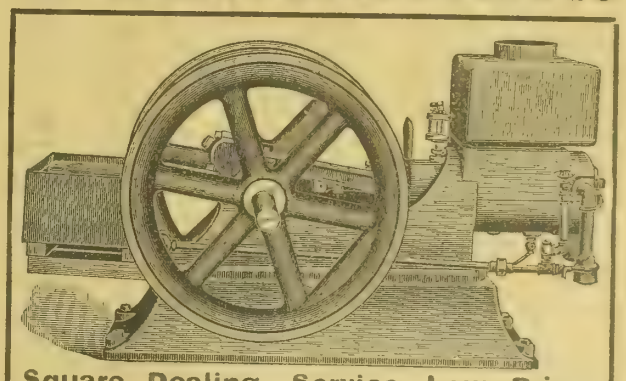
CARRITTE-PATERSON MFG. CO., Limited
St. John, N. B. Halifax, N. S.

On a Solid Foundation.

The one solid foundation if business success is **Square Dealing, Service, Efficency, Quality, Price and Durability.**

The success achieved by the **Waterloo Boy Gasoline Engine** is built upon this solid foundation.

The **Waterloo Boy** has been on the market for 18 years. During that time the engine has never failed to make good. For 18 years the makers have kept every promise ever made to the public. They have never failed to live up to their advertising and to sustain their guarantee. The record of **The Waterloo Boy** is a record of satisfaction because it is a record of square dealing.



Square Dealing, Service, Low Price, Durability, Efficiency, Quality, Making Good for Years.

THE WATERLOO BOY

is the simplest gasoline built. A boy can run it as well as a man. One of the special features of the **Waterloo Boy** is the **Speed Lever,** which works like the throttle of a locomotive. You can vary the speed while the engine is running from 50 to 75 revolutions per minute.

Our patented **Mixer** does away with the pump and secures economy in the use of fuel. The old reliable **Fly Ball Governor** is sensitive and keeps the speed steady.

Our improved **Igniter** is as simple as a pair of scissors, it never misses.

Your local agent is our representative to help you if you need help and to see that you get satisfaction, and this without extra charge. **Waterloo Boy** engines will cost you less than other engines and you have this service thrown in.

What shall we say of the price? Simply this—we name the **Underselling Price.** How can we do this? Because of the simplicity of our engine, the large volume of our business and our well equipped factory. The fact that the makers specialize on engines only enables them to build them cheaper than others.

FARM AGENTS WANTED. Because of the above facts the **Waterloo Boy Gasoline Engine** is the right one to take out an agency for. Our Square Deal protects the agents. We have an attractive proposition to make you. Write me to-day.

J. D. FRIER, - - Sussex, New Brunswick

The Farmers' Ten Commandments

1st. Reflect thereon that the parent plant and seed bequeath equally their good points and bad points, their virtues and faults to their offspring, and that it is incumbent on thee, not only for thine own profit, but also for the advancement of farming, to do thy share towards the improvement of plants.

2nd. Thou shalt gather the seed from such plants as outwardly bear the stamp of being true to their species. Grow thy seed separate from the main crop harvest, thresh and store separately.

3rd. Thou shalt not collect seed from plants which have run to seed before due time or in any other way are not satisfactory, for the faults no less than the good qualities, ar passed on to the third and fourth generations.

4th. See also that thou takest th seed from plants distinguished for fruitfulness and for growing crops of the best quality.

5th. Thou shalt not gather seed from plants that show evident signs of weakness or which suffer from any disease or from insect pests.

6th. Thou shalt not take seed from a plant grown on a soil which is dirty or poorly cultivated.

7th. Give thou preference to plants that have grown and done best under natural farm conditions for such produce the best offspring.

8th. Thou shalt not gather seed from those plants which ripen latest; nor sell the best grain and use the poor for seed.

9th. Thou shalt see to it that special care is given to testing seeds lest they fail to grow and thy seeding is in vain.

10th. Gather not seed from late ripening soils, nor collect the seed too soon before it is thoroughly ripened. Its productiveness and quality for seed thou shalt further insure by heavy fanning, thorough treatment with formalin or bluestone and early seeding an carefully prepared land.

Hold thou by these commandments so shalt thou have pleasure in thy crops and profit in thy work.

Value of a Cow.

H. B. Gurler, of Mississippi, has some ideas on the value of a good cow, and these same ideas are worthy of consideration. He says that when a cow that produces 200 pounds of butter per annum at a food cost of $39 and a labor cost of $12.50 is worth $35, the cow that produces 400 pounds of butter annually is worth $400, and that the owner can make net $16 more from her after paying interest on the $400 than he can from the cow that produces 200 pounds of butter. There is no more labor connected with the 400-pound cows than there is with the 200-pound cows. The price at which the butter has been credited—i. e., twenty cents per pound is the net price from the creamery after the making has been paid for. In this herd the increased cost of feed for the 400-pound cow was more than offset by the increased amount of skim milk, so we have the 200 pounds of increase of butter as net profit over the 200-pound cow. Two hundred pounds of butter at twenty cents is $40. We have $400 invested in this cow, which, at 6 per cent interest is $24, which we will deduct from the $40, and we have left $16 to the credit of the 400-pound cow.

Fat and feed are worth considerably more than is stated by Mr. Gurler, but they illustrate the point he wishes to make—the difference in cows.

INTERNATIONAL STOCK FOOD CO., Ltd., TORONTO, CAN.

M. W. Savage, sole owner of "International Stock Food," and also of "International Stock Food Farm," positively Guarantees that His World Famous Champion Stallions, Dan Patch 1:55, Minor Heir 1:58, Hedgewood Boy 2:01, Geo. Gano 2:02¼, and his brood mares and colts eat it every day. You are specially invited to visit this Great Harness Horse Breeding Farm ten miles from Minneapolis, and see the practical results of the every day use of the greatest purely vegetable animal tonic ever used on a farm. It is constantly used and strongly endorsed by over Two Millions of the most up-to-date Stockmen and Horse Breeders of the world.

INTERNATIONAL STOCK FOOD
THE GREAT ANIMAL TONIC

Is sold by over 100,000 dealers on a spot cash guarantee that its use will cost you nothing unless you get paying results. If it ever fails your money will be promptly refunded. International Stock Food is a strongly concentrated medicinal preparation composed of roots, herbs, seeds, barks, etc., and is equally good for horses, colts, cows, calves, hogs, pigs, sheep, goats, etc. It is fed in small amounts mixed with grain and purifies the blood, tones up and strengthens the system and greatly aids digestion and assimilation, so that each animal obtains more nutrition from all food taken. It is not amount of grain fed but the amount assimilated or taken into the system that fattens or keeps your stock in good condition, and as International Stock Food increases assimilation it will save you money. It will make you more money than you can possibly make without its use. It also cures and prevents many forms of disease, and is absolutely harmless, even if taken into the human system. International Stock Food is endorsed by over two million farmers who have used it for years. The editor of your farm paper will tell you we do exactly as we agree, and as reference we give you the Traders Bank of Canada.

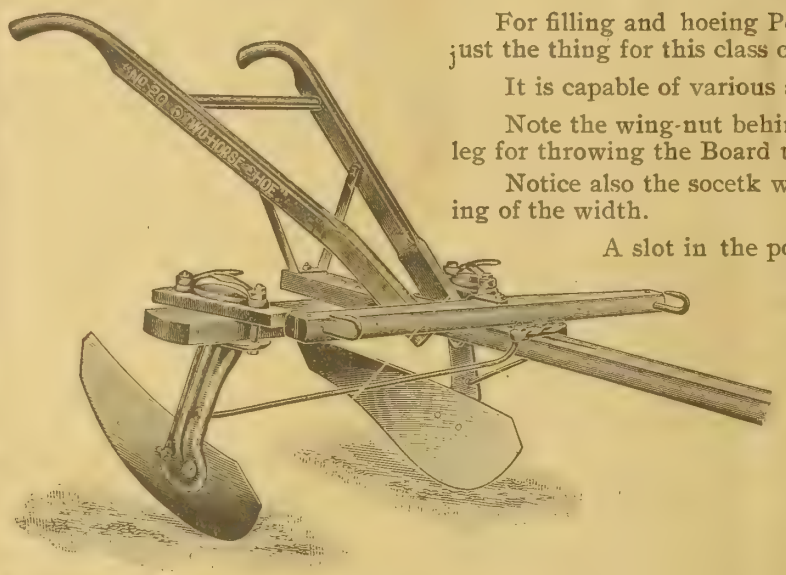
PROVED ITS INVALUABLE WORTH.

KEHO, ALTA, 10-10-10

The International Stock Food Co., Toronto, Ont.—Gentlemen: I feel in honor bound to offer you my testimonial in favor of your Stock Food. I have used it faithfully this summer and proved its invaluable worth. It made my pigs grow, the results were simply marvelous. I would not be without it for anything. My horses got a very nasty distemper cough in the spring, but the food cleaned it completely out of their system and they went through the Spring work fine and came out of it rolling fat. Please duplicate my last order. Mrs. Coe requests me to tell you that your Poultry Food is excellent, that feeding your Poultry Food doubles the quantity of eggs, in fact, it could not be better for egg production and keeping the fowl healthy.—Yours sincerely (sgd.) ALF. R. COE.

SEE OUR DEALERS, or WRITE US with regard to our FREE TRIAL OFFER

VERITY TWO-HORSE HOE



For filling and hoeing Potatoes and Corn. This implement is just the thing for this class of work.

It is capable of various adjustments as will be seen by picture.

Note the wing-nut behind the board and the slotted hole in the leg for throwing the Board up or down for shallow or deep hoeing.

Notice also the socetk wrenches on top, facilitating the adjusting of the width.

A slot in the pole allows for the movement forward or backward of the Leg Braces when narrowing or widening as the case may be.

By changing the right leg over to the left and the left over to the right, the earth can be thrown away from the plant. The Legs can be adjusted so that the Boards point to the plant more or less, as desired.

Write for catalogue.

THE MASSEY-HARRIS CO., Ltd., - - Moncton, N. B.

Makes Pigs "Stay Put"

The hog never grunted that could get the better of a Maritime Wire Fence. For this springy, taut, vastly strong fence, made of extra-quality hard-drawn coil-spring STEEL wire, has its verticals and cross wires locked together with the death-grip lock that CAN'T loosen or slip under any strain whatever. Your cattle and swine will stay where you put them if you fence with this BETTER fence. Once properly erected, Maritime Wire Fence stays taut, straight, sagless and sightly. It is good for twice the fence service ordinary fence can give. Yet it costs no more

MARITIME WIRE FENCE

Save Yourself Worry and Money

Bid fence worries good-bye, and save money, too, by getting the right fence in the first place. You won't have to be patching your fences every spring if you fence with Maritime Wire Fence. It STAYS put too. Made and sold on honor. Send for the Fence Book and Price Lists. Do this now.

It would pay you to be our agent. Send for new 1911 offer. 12

$3,600 in Cash Prizes for Farmers

Tell Us How You Did It

You may win a prize by doing so

SUPPOSE your friend Bob Wilson, on the next concession, "pulled up" at your front gate on the way back from market and asked about that silo or barn foundation you built, you would be glad to tell him, wouldn't you? And it wouldn't take you long, either, would it? And, as a matter of fact, you'd find as much pleasure telling him as he would in listening—isn't that right?

First you would take him over to view the silo or barn foundation. Then you would start to describe it—its dimensions—the kind of aggregate used—the proportions of cement used—number of men employed—number of hours' working time required—method of mixing—kind of forms used—method of reinforcing, if any—and finally, what the job cost. So that by the time you finished, neighbor Wilson would have a pretty accurate idea of how to go about building the particular piece of work which you described.

Now couldn't you do the same for us, with this difference—that you stand a good chance of getting well paid for your time?

In Prize "D" of our contest, open to the farmers of Canada, we offer $100.00 to the farmer in each Province who will furnish us with the best and most complete description of how any particular piece of concrete work shown by photograph sent in was done. The size of the work described makes no difference. The only important thing to remember is that the work must be done in 1911 and "CANADA" Cement used.

In writing your description, don't be too particular about grammar or spelling or punctuation. Leave that to literary folk. Tell it to us as you would tell it to your neighbor. What we want are the facts, plainly and clearly told.

Sounds simple, doesn't it? And it is simple. And surely it is well worth your while when you think of the reward in view.

Now sit right down, take your pen or pencil—fill out the attached coupon—or a post-card if it's handier—and write for the circular which fully describes the conditions of this, the first contest of the kind ever held in Canada.

Every dealer who handles "CANADA" Cement will also be given a supply of these circulars—and you can get one from the dealer in your town, if that seems more convenient than writing for it.

Contest will close on November 15th, 1911—all photos and descriptions must be sent in by that date, to be eligible for one of these prizes. Awards will be made as soon as possible thereafter. The decisions will be made by a disinterested committee, the following gentlemen having consented to act for us, as the jury of award: Prof. Peter Gillespie, Lecturer in Theory of Construction, University of Toronto; Prof. W. H. Day, Professor of Physics, Ontario Agricultural College, Guelph; and Ivan S. Macdonald, Editor of "Construction."

Having decided to compete for one of the prizes, your first step should be to get all the information you can on the subject of Concrete Construction on the Farm. Fortunately, most of the pointers that anyone can possibly need, are contained in our wonderfully complete book, entitled "What the Farmer Can Do With Concrete." A large number of Canadian farmers have already sent for and obtained copies of this free book. Have you got your copy yet? If not, you'd better send for one to-day. Whether you are a contestant for one of our prizes or not, you really ought to have this book in your library. For it contains a vast amount of information and hints that are invaluable to the farmer.

Please send full particulars and book.

Canada Cement Company, Limited, Montreal

It will pay you to start your letter with the words: "I saw your adv. in The Maritime Farmer." Advertisers like to know that they are dealing with farmers who read a farm paper. Remember we guarantee you a square deal if you mention The Farmer.

Getting Good Strawberries.

I hope your strawberry bed was mulched with straw last December, so it is looking well now. Take it off at once and start cultivation the very day the soil is dry enough to work perfectly. Put on a little more slag or bone or ashes (according to what was not furnished in abundance last year) but don't give the job to the hired man unless you know he is careful. Don't put on stimulants in the form of soluble nitrates unless you are sure the patch is deficient in these. Remember that it takes lots of potash to mature a big crop of berries, and that there is never any danger of having too much phosphoric acid.

If you have no bed, start one. Get your plants of a successful fruit man and pay his price. A parent plant can produce 50 runner plants in a season, but not over 10 good ones. and you must prune accordingly. Old garden soil, lacking humus, or newly-turned sod are equally fatal. Take land full of humus that has been worked a year or two, to eradicate the white grubs. If matted rows keep them 6 inches apart. Single rows should be 18 to 22 inches apart and the matted rows twice that. Be sure to set nearly dormant plants, unless from nearby fields. In any case, clip both roots and top at least half their length, puddle roots (use clay) immediately, and when setting use a spade. Start the cultivator the next day and keep it up every week or five days.

Never suffer the first runner plants to set. They are too feeble. Cut all runners for a month, also clip out every blossom stalk. If you keep in mind that the strawberry belongs to the grass family, that it is fond of nitrates and cool moistness, you will grow stout plants. They also demand sweet land, that is, an excess of lime, though they are an acid fruit. Finally, they want firm land.—D. S. Kelsey, in Maine Farmer.

Treating Trees Girdled by Rabbits.

Rabbits have seriously injured fruit trees in many orchards by girdling this winter. Prof. J. G. Moore, of the College of Agriculture of the University of Wisconsin says that when the girdle is only three or four inches wide the tree may be saved by bridge grafting. Trees with large patches of bark removed entirely around the trunk cannot be successfully treated, though those not too badly injured may be saved by special treatment.

Bridge grafting should be done in early spring, scions from healthy trees being selected, from twigs produced last season. The torn edges of the wound should be cut off smooth, and all badly loosened bark removed. The scion shou,d be cut half or three-quarters of an inch longer than the wound, and the ends of the scions pointed.

The scion may then be inserted under the edge of the bark, care being taken to have the cut on the scion made rather slanting, to give considerable space for it to unite with the bark of the tree. Several of these scions should be put in around the tree at intervals of not more than one and one-half inches. On small trees, three or four scions will be sufficient.

It is a good practice to paint over the wounded areas with white lead, and they may further be protected by binding with cloth. Care should be taken, however, to see that the twine that holds the cloth is not so tight as to girdle the newly set scions. After the scions have become firmly established, the c,oth may be removed.

The scions will continue to increase in size, and as they approach each other the union of one scion to the other may be accomplished by shaving the sides of the scions. In time the entire girdled area may be entirely healed over in this way.

In some cases, bridge grafting will not be necessary. If the inner bark has not been removed by the rabbits, the tree may be saved by immediately protecting the girdled area before it has had time to dry out, by wrapping with cloth which has been treated with grafting wax. The inner bark will then form an outer bark, without serious injury. Where it can be used, this method is bet ter than bridge grafting. Trees on which the bark has been removed along the sides and not entirely around the trunk, will be benefited by painting the wound. Before this is done, however, the rough edges of the bark should be removed so as to facilitate healing.

Feeding Oil Meal.

Oil cake or oil meal in proper quantities is considered by our best stockmen to be one of the most healthful foods that is on the market, states Prof. G. C. Humphrey of the animal husbandry department of the College of Agriculture of the University of Wisconsin. "Its value is that it keeps the animal in the most healthy condition, no other feed having sach a beneficial effect on the digestive tract.

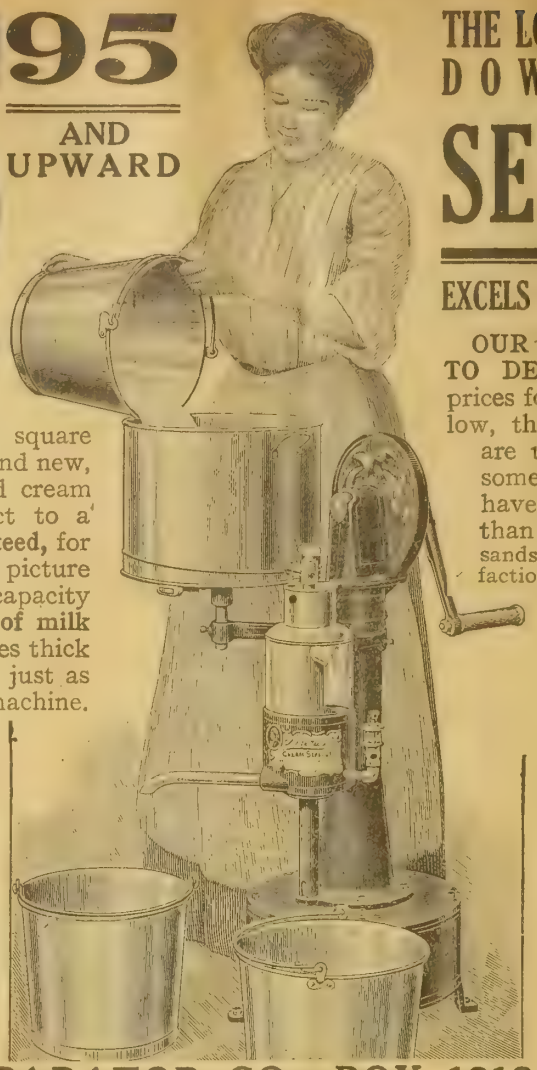
The price of the feed is considered prohibitive by many farmers, but considering the fact that it contains nearly 30 percent. digestible protein, the stockman can well afford to pay the market price, i order to have at least a small quan tity of this feed available.

Old process, rather than new process oil meal, should be secured,

$15.95 AND UPWARD

THIS OFFER IS NO CATCH

It is a solid, fair and square proposition to furnish a brand new, well made and well finished cream separator complete, subject to a **long trial** and **fully guaranteed,** for $15.95. Different from this picture which illustrates our large capacity machines. Skims **1 quart of milk a minute,** hot or cold; makes thick or thin cream and does it just as well as any higher priced machine. Any boy or girl can run it sitting down. The crank is only 5 inches long. Just think of that! The bowl is a sanitary marvel, **easily cleaned,** and embodies all our latest improvements. Gears run in anti-friction bearings and thoroughly protected. Before you decide on a cream separator of any capacity whatever, obtain our $15.95 proposition.



THE LOW DOWN AMERICAN SEPARATOR

EXCELS ANY SEPARATOR IN THE WORLD

OUR LIBERAL TRIAL ENABLES YOU TO DEMONSTRATE THIS. While our prices for all capacities are astonishingly low, the quality is high. Our machines are up to date, well built and handsomely finished; run easier, skim closer, have a simpler bowl with fewer parts than any other cream separator. Thousands of machines in use giving splendid satisfaction. **Write for our 1911 catalog.** We will send it free, postpaid. It is richly illustrated, shows the machines in detail and tells all about the **American Separator.** Our surprisingly **liberal long time trial** proposition, **generous terms of purchase** and the low prices quoted will astonish you. We are the oldest exclusive manufacturers of hand separators in America and cannot afford to sell an article that is not absolutely first class. You save money by dealing with us and at the same time obtain the finest and highest quality machine on the market. Our own (manufacturer's) twenty-year guarantee protects you on every **American Separator.** We ship immediately. **Cream separators are admitted into Canada free of duty.** Write us and get our great offer and handsome free catalog. ADDRESS,

AMERICAN SEPARATOR CO., BOX 1212, BAINBRIDGE, N. Y.

POTASH Means PROFIT

when employed judiciously in conjunction with the required amounts of Phosphatic and Nitrogenous Fertilizers.

POTASH may be obtained in the highly concentrated forms of **Muriate of Potash and Sulphate of Potash** from the leading fertilizer dealers and seedsmen.

Before purchasing be sure to obtain copies 8f our Illustrated Bulletins, which will instruct you **how to purchase and use fertilizers economically.**

The following VALUABE BOOKLETS will be mailed FREE to any reader of this paper :

"Artificial Fertilizers, Their Nature and Use."

"Farmer's Companion."

"The Potato Crop in Canada."

"Fertilizing Orchard and Garden" etc

The Dominion Agricultural Offices of the Potash Syndicate,

1102b TEMPLE BUILDING, - TORONTO, ONT.

so far as possible, for the reason that 94 percent of the protein in old process oil meal is digestible as compared with only 84 percent of the new process meal.

"Oil meal may be fed to all classes of farm stock," continues Prof. Humphrey. "Fattening steers will use to great advantage from two to three pounds of oil meal daily in connection with other feeds. Larger amounts can be used profitably when prices are not too high. Feeding oil meal in the form of nut-sized cakes is considered preferable to the loose meal by most of our steer feeders.

Dairy cows will consume one or two pounds of oil meal daily with their grain rations, and during the winter feeding period more or less oil meal is almost indispensable in order to keep the cows in the best condition for producing milk and butter fat. For growing calves, sheep and hogs, oil meal can constitute about one-tenth of the grain ration fed, and prove very beneficial. Horses may be fed small quantities, although its general use for horses is not recommended.

What Should the Farmer Know About His Gasoline Engine?

Fifty or sixty years ago all the work of the farm requiring power was done by means of the old-fashioned sweep powers operated by horses. Even such rigs were scarce and only the more important work was done by power at all, the vast majority being done by hand. Then came the steam engine—efficient in its day, but not at all adapted to the individual farmer's work. Such engines were too expensive and required too much skill for operating to make them available for the every day work of the farm. They served very well for threshing grain and operating saw mills, but aside from these purposes, were little used. Even in more recent years when, through changed conditions, small steam engines became more available for the farmer's use, they have not become widely used. For such work as grinding and cutting feed, sawing wood, running the fanning mill, and pumping water, etc., very few have been used. The steam engine was compelled to overcome a very great prejudice on the part of farmers in general, a prejudice far greater than the gasoline engine has had to contend against. A gentleman who was living when the steam engine was first introduced for farm work tells me that many farmers would not allow a steam engine on their places, even though they could not fail to realize its great advantage over horse power. At the present time we find many farmers who are similarly prejudiced in regard to gasoline engines. All sorts of absurd objections are raised against this great labor saver; many of these objections, of course, being ridiculous, yet sincere. For instance, a man once told me that he would not buy a gasoline engine because he was afraid that by getting a large quantity of gasoline in the cylinder the engine would be blown to pieces. His idea was that if a small amount of gasoline is explosive a larger quantity would be more so. Yet we all know that a large quantity of gasoline in a small engine cylinder is absolutely non-explosive. Thanks to the work of Gas Review and other agricultural papers, such ignorance is being rapidly overcome and it is a matter of but a short time until every progressive farmer will own an engine.

The gasoline engine has filled a place in the economy of the farm that never could be occupied by any other known source of power. It has made it possible for every farmer to have available a reliable and convenient source of power for his every day farm work. Above all, it has furnished him with a power that can be operated by even the farmer's wife and used for the drudgery about the house. Instead of being obliged to stand for an hour operating the churn or washing machine it has made it possible for her to accomplish this work with but a fraction of the labor. It has made it possible for the farmer to handle more work and to do it more economically in spite of the higher wages and scarcity of farm help.

In reading the catalogues of many manufacturers of gasoline engines, we meet with such statements as "our engine is absolutely automatic and requires almost no attention," "requires no care," and similar statements which would tend to make one believe that such statements are literally true and that the gasoline engine is a machine which requires little attention and no knowledge on the operator's part as to the functions and offices of its various parts. Many buy engines believing the above and are sadly disappointed when they find that the gasoline engine does require attention and does require a thorough understanding on the operator's part as to the functions and operations of its parts.

I have often thought "What should the average operator know about the functions and principles of his engine to succeeed with it?" and it is with an attempt to outline this information that the following is written. We are often confronted with persons who have difficulty in getting satisfactory service out of their engines. Is it the fault of the operator or the machine? Sometimes one, sometimes the other. Gasoline engines have been manufactured on a large scale in this country for twenty or twenty-five years. One maker has put out over one hundred thousand machines, another sixty thousand, another thirty thousand. Now it is hardly reasonable to suppose that there is any very serious defect in these machines or it would have been discovered and corrected by the makers long ago. That bad design and bad workmanship do exist there is no doubt, and many engines are made and sold that are not what they should be. The farmer who desires to buy an engine should seek the advice of some expert who really knows engines, their good and bad points, and their suitability for the purpose for which they are intended. He should consider quality first and price afterwards. Too many buy an engine simply because it is a few dollars cheaper, never considering quality in the least. Buy a machine from a reputable manufacturer who will make good his guarantee, a machine that will stand up for years of satisfactory service and you will have an engine that will be a source of satisfaction and profit to you and which will last long after the price is forgotten.

Then I should say in the first place, that to succeed with a gasoline engine we must, first of all, have a good machine, one that is properly designed and built and one that functions properly. In order to understand what to do when difficulty arises, we must first of all realize that the internal combustion engine depends in principle on the fact that mixtures of certain fuels and air in definite proportions are imflammable or explosive. What really happens in the engine cylinders is that a mixture as above is drawn in and fired, driving the piston forward, thus doing work. Practically, it is necessary to compress the mixture in order that the engine may be efficient.

Buy a Gasoline Engine!

But when you do buy, get a good one.

Buy it from us because we sell you direct. No sub-agents' commission and travelling expenses for you to pay.

Buy it from us because we are the oldest engine house in Canada and therefore have a reputation to sustain.

The name of our engine is

The Improved Stover

It will develop a horse power on the least possible amount of gasoline.

It does not use up batteries on the idle strokes.

It is simple and easy to operate.

It will develop its rated power when running at a moderate speed.

Its governor regulates perfectly.

Its speed can be instantly changed at the will of the operator.

It is perfectly balanced and is not hard to hold in position.

It has a positive water circulation, and very little water is required.

It gives you engine value for every dollar you pay.

Our St. John Machinery depot is the largest in the Maritime Provinces. Every engine is backed by our absolute guarantee.

All sizes from 1 to 60 Horse Power.

Write for catalogue and prices. DO IT NOW.

Advertise in the Maritime Farmer.

The earlier forms of engines did not compress the mixtures and, as a consequence, showed a thermal efficiency of ten to twelve per cent. while the modern well designed engine has a thermal efficiency of twenty nve or thirty per cent. Any one of several fuels may be used but gasoline is most commonly used in farm engines as it is volatile, has a high thermal value, and is comparatively cheap. Alcohol and kerosene are used to less extent. A recent bulletin, No. 392 of the United States Geological Survey, deals extensively with relative results from the use of gasoline and alcohol as fuel for internal combustion engines. The results given prove that nearly all gasoline engines are adapted to the use of alcohol as fuel, the only difference being that alcohol requires a wider opening of the needle-valve than gasoline. Kerosene is used to some extent but has always been subject to the very serious objection that it is hard to vaporize, hence liable to foul the engine cylinder. Recently, however, several firms have put engines on the market which operate successfully on kerosene with a great saving in the cost of operation. Other fuels are used such as distillate and even crude petroleum when the engine is fitted with suitable vaporizers for such fuels.

It should always be borne in mind that liquid fuels are mixtures of various substances and hence are liable to vary in composition and behavior. Gasoline, as ordinarily found on the market, the grade commonly sold for use in engines, weighs about five and nine-tenths pounds per gallon while kerosene weighs about six and eight-tenths pounds per gallon. The heavier oils, of course, weigh more per gallon. It is necessary that we have a mixture of air and fuel in definite proportions in order that this mixture may be explosive. This point is not appreciated by most engine operators and is the cause of many difficulties. When gasoline is used as fuel, the gasoline vapor and air must be mixed in proportions of about one to eight in order that we may get the maximum amount of work out of the fuel. If the proportion of fuel is much less than this the mixture is weak, will not fire so quickly, is slow burning, and consequently causes back-firing. If the proportion of fuel is increased much above that indicated above, the mixture becomes less explosive with reduction in power, and, of course, loss of fuel. The following case illustrates this point very nicely. A certain engine under brake test with the needle valve one-half turn open, the air supply fixed and the ignition constant, gave a fuel consumption at the rate of one gallon of gasoline per hour, the engine showing 11.9 b.h.p. On the succeeding test, with conditions the same, excepting that the fuel valve was opened one-fourth turn more, the fuel consumption raised to one and five-tenths gallons per hour while the horse power dropped to 8.8 b.h.p. This shows that aside from the waste of fuel by having too rich a mixture, we really get less power out of the engine.

The proportion of air to fuel varies with the different fuels and can best be determined by actual test. The effect of altitude has a very great effect on this point. With the same valve settings, an engine will usually give about ten per cent. less power at three thousand feet altitude than at sea level, the reason, of course, being that the atmospheric pressure decreases as the altitude increases. Each operator should sudy his individual conditions and adjust his engine to suit same.

In adjusting fuel valves it should be the aim to use just as little fuel as possible without causing the engine back-fire or to cause it distress in carrying the load. It should be borne in mind that with hit and miss governor engines we may easily starve the mixture until a greater number of power impulses will be required to keep up the speed, hence we may be using as much fuel as before. This, of course, should be guarded against in making adjustments. In order that a liquid fuel may be used in the engine cylinder, it is necessary that it be properly mixed or carbureted with air. All engines are equipped with some means for effecting this. There are many mixing devices which are perfectly satisfactory for this purpose. One of the most successful manufacturers of carburetors has placed over half a million of these devices on the market and needless to say his product is very successful. Much depends on the engine being equipped with the proper device for effecting this mixture. Some fuels are much harder to vaporize than others and require different devices. When it is remembered that

Vigorous Manhood.

Two "Health Belt Men." One 50 Years Old, the Other 30. Can You Pick Out the Younger?

I can show you how to restore your youth and how to keep it. A "Health Belt Man" CANNOT grow old; he must be young forever. Years count for nothing in this life, so long as you have great vitality. Weakness, Nervousness, Unmanliness are conditions to be laughed at by the intelligent use of my great appliance, for it gives, in abundance, all that vim, vigor and nerve force which the weakened system craves—Worn every night all night for two or three months, it sends a great, warm, glowing volume of electricity into your body through the nerve centres at small of back; from the first hour's use you experience a decided benefit; there is a great mysterious force which gets right to work. No drugs to be taken; no conditions imposed except that dissipation must cease. Help nature that much; the Belt will do the rest. It takes the weakness and kink out of your back; it drives rheumatic pains away from all parts of your body, you will feel and look young and strong again; woman and man noticing your physical change will be more attracted toward you on account of your new vitality and life; in two months you can experience the full vigor of perfect manhood, or you need not pay.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all the risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it doesn't do the work.

Let Me Send You These Two Books FREE.

They fully describe my Health Belt and contain much valuable information. One is called "Health in Nature," and deals with various ailments common to both men and women, such as rheumatism, kidney, liver, stomach, bladder, disorders, etc. The other "Strength," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

If in or near this city, take the time to drop in at my office that you may see, examine and try the Belt. No charge for advice, either at my office or by mail. They are better than a fortune for any one who needs new vigor.

DR. M. F. SANDEN, CO., 140 Yonge Street, TORONTO, Ont.

Dear Sirs—Please forward me your books as advertised free.

NAME.....

ADDRESS.....

gasoline is a mixture of several hydrocarbons and that some grades are much more volatile than others, we realize why it is that some grades of gasoline give trouble while other grades work satisfactory in the same engine. Kerosene must be heated before a suitable mixture can be made, however, some makers equip their engines with mixing valves which are claimed to accomplish the results without heating the fuel. The one thing to remember is that the fuel and air must be thoroughly mixed in definite proportions. We must remember that the action of carburetors and mixing valves depends on the inrushing air caused by the vacuum in the cylinder. This explains why it is often necessary to open the needle valve farther when starting than when the engine has reached full speed; the velocity of the air being less at the slow speed in starting it has less tendency to induce good mixing. We must always remember that vaporization requires heat, and it is absolutely necessary that the fuel be vaporized before it will ignite. Some engines are very hard to start in cold weather and it is always a good plan to warm the cylinder of almost any engine before attempting to start it in very cold weather. Some operators do succeed in starting their engine after a great amount of cranking but it should be borne in mind that such a procedure simply accomplishes what could be accomplished much easier otherwise. The compression in the cylinder gradually warms it up and makes starting possible.

Agai n I should say that in order to succeed with the gasoline engine the operator should know that his ignition system is in good order, that for a make and break igniter at least six volts are required for successful operation. He should know that in order to have six volts it is necessary to have from four to six caustic soda cells, from four to six dry cells or a storage battery made up of three units. Each unit of a storage battery must give about two volts. A fresh dry cell as made by the best manufacturers will give from one and a half to one and eight-tenths volts. Each cell of the caustic soda type will give about one volt.

The operator should know that his make and break igniter consists of the cells to supply the current, and the induction coil to magnify the current, one electrode insulated from the engine frame, the other grounded. He should know that anything which destroys the insulation of the one electrode will prevent satisfactory operation. Few operators realize the necessity of taking good care of the induction coil. It should be remembered that anything which destroys the insulation of the coil will make it useless. For those who possess engines fitted with jump spark ignition, even more care must be taken. The operator of such a machine should know that his ignition system consists of two complete circuits, the primary and the secondary. The first or primary, which is of low voltage, induces the current in the secondary, giving rise to current of very high voltage. Particular care must be taken of jump spark coils as the very high voltage employed necessitates perfect insulation. For a detailed description of the different forms of ignition systems and diagrams of same nothing better can be referred to than the article on page twenty of the May 1909, issue of Gas Review.

Finally the engine operator should know that his engine must be kept properly lubricated and properly cooled. The cooling of the engine cylinder is very important. The engine should never be run even for a few minutes without water in the jacket. Many an engine has been ruined through carelessness on this part. An engine must be kept clean. Never gllow the governor and other working parts to become gummed up with lubricating oil. A governor to function properly must be free to act quickly and easily.

Allow me to say in conclusion, read all you can about gas engines. They are the power of the future. If you own an engine or are interested in one you cannot afford to be without Gas Review. Even to many of us who have had years of experience in the gas engine field, new ideas are constantly being brought to our attention. One idea gained from reading this paper may save you a large repair bill.—J. H. Beattie in Gas Review.

Nova Scotia Provincial Exhibition Aug. 30th to Sept. 17th, 1911, Halifax.

A $5.00 Seed Prize

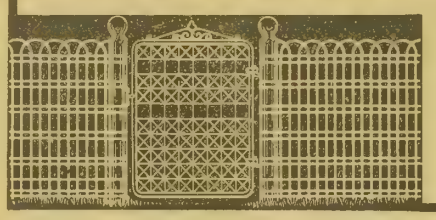
We will give $5.00 in gold to the person who finds the word "seed" or "seeds" the most times in ads. in this and succeeding issues up to April 30th. It doesn't cost you one penny to try for this $5.00 but in looking for the word "seeds" note which seed ads. interest you most, and write those advertisers, sending an order or asking for free catalogue. In your letter to us telling how many times you find the words "seed" or "seeds" you must give us the names of all seed or nursery advertisers in this and succeeding issues up to April 30th to whom you have written mentioning The Maritime Farmer. This is an easy condition, and the catalogues or seeds you buy will be worth much more than you pay. Go to work.

The $5.00 will be mailed promptly to one finding them the most times. Tell how many times you find them on each page. In case of tie the prize will be divided. Don't delay. Doesn't cost a cent to enter. You might as well have the $5.00 and you are going to write for catalogues, so do it now. Lists must be mailed by April 30th.

Strength and Service

That's what you get in Peerless Gates—the strength and service that keep them swinging evenly on their hinges year after year. They won't warp or sag because the frames are made of heavy, steel tubing, electrically welded into one solid piece.

Peerless Farm and Ornamental Gates



We manufacture lawn, poultry and farm fences and gates. We build them so they will last long and give the most satisfactory service. Our standard of quality is high, and we stick to it firmly. You can always depend on Peerless goods. Write for full particulars.

THE BANWELL HOXIE WIRE FENCE CO., LTD.
DEPT. K, WINNIPEG, MAN., HAMILTON, ONT.

IT WILL ASTONISH YOU.

Everybody is astonished at the marvellous gain that comes to their home and to themselves by the use of

RAMSAYS PAINTS

Don't you think it would be better for you to enquire about these paints? Don't use poor paints—they cost too much. Don't use dear paints—they cost too much. Use Ramsay's Paints, sold at just the right price for correct painting. We issue a handsome booklet on house painting. You should have it. Write us for Booklet B D We will mail it free.

A. RAMSAY & SON CO.,
THE PAINT MAKERS, - - Montreal.

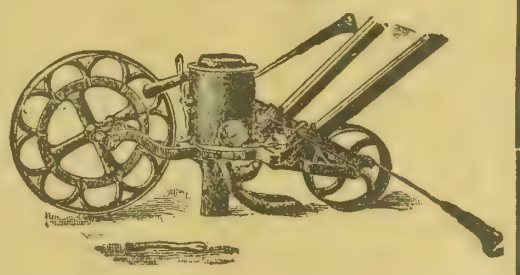
Threshers & Hay Presses

If you are thinking of buying either of the above, it would be as well for you to write us now and get quotations, so that we may have them ready for immediate delivery when you want them.

GARDEN SEEDERS
"The Handiest Implement on the Farm."



This machine has a marker for each row, makes the drill and covers the seed as you go along. It is arranged so that by turning a disc any sized seed may be sown accurately. 200 in stock, ready for shipment. Write for picture showing details of this handy machine.

Our line of Plow Castings is complete and are suitable for any of the different makes of Plows.

Our "Star" Feed Boiler is built to suit your requirements. It is the Boiler you should use if convenience and economy are of interest.

The Sussex Manufacturing Co., Ltd.,
Sussex, - N. B.

Advertised products usually possess special points of merit. That is why they are advertised. When you buy goods advertised in The Maritime Farmer you are sure of getting a square deal.

A Timely Warning Re Mangel Seed.

Permit me to intimate to your Farmer readers that in order to abridge the danger of partial failure of their mangel and beet crops, they will this year need to be particularly careful to ascertain the percent. of seed balls capable of producing sprouts and to adjust their seeders accordingly.

Because of the climatic conditions in 1909 and 1910 in those European countries from which we obtain ou mangel and beet seed, practically all the available supply this year is lo in percentage vitality. Our Canadian seed merchants have done what they could to procure seed that would conform to the provisions of the Seed Control Act, which fixes a standard of vitality for good mangel and beet seed of 90 per cent. of th seed balls, and 160 sprouts from 100 seed ball (what is commonly known as mangel seed is really a fruit containing from three to six small seeds); and the law is that when the percentage vitality falls below two-thirds of this standard for good mangel seed, then the seed must be labelled, showing the actual percentage of balls and of sprouts capable of being produced from the seed. All the seed inspectors now in the field have been notified to pay particular attention to the quality of the mangel seed exposed for sale; but the information and punishment to seed merchants resulting therefrom will not protect users of mangel seed this year.

There is no need for any farmer to reduce the area intended for planting to mangels and he will suffer no danger from crop failure providing tha he will take the trouble to determine the percentage of seed balls capabl of germinating and increase the amount of seed per acre accordingly. In most cases it will be found that at least one-half more mangel seed than usual will have to be sown this year to secure a reasonably good stand of plants. Farmers should give the preference to mangel seed put up by reliable firms and no hesitate to procure seed of their favorite varieties from bags or packages on which the percentage of vitality is branded, even though that percentage would seem to be rather low.

GEO. H. CLARK.
Seed Commissioner, Ottawa.

A CURE WITHOUT DRUGS

Wear My Belt Until Cured and Pay Me When the Work is Done

I have the grandest invention of the age for weak, rundown, wornout men; the surest and easiest cure for all nervous and chronic diseases. Its wonderful power is directed to the seat of the nervous system through which its vitalized strength penetrates into all parts of the body, carrying new life to every function which has been weakened by disease or dissipation, restoring energy to the brain and power to the system. No weak man will ever regret a fair trial of this invigorator.

Why will you be weak? Why do you go on from day to day when you know you are losing your nerve force—your manhood—when you see a cure within your grasp? Do not delay a matter which is the key to your future happiness. Whatever your condition to-day, you will not improve as you grow older. Age calls for greater vital force, and the older you get the more pronounced will be your weakness.

I want you—if that means you—to come to me, and if I say that I can cure you I don't ask you to pay me until I DO SO, if you give me reasonable security for the Belt while you use it. That is fair, surely. You take no chances, as I know what I can do, and I'll run the risk.

All men cannot be MILLIONAIRES, but thousands of them could be much better off FINANCIALLY, SOCIALLY, and in every other respect if they would guard their HEALTH. With VIGOROUS HEALTH—a body full of ELECTRIC ENERGY—a man can make OPPORTUNITIES if he don't find them, but, lacking in the COURAGE, and SELF-ASSURANCE that is born of MANLY VIGOR, he is but a derelict—a vessel without mast or rudder—cast hither and thither by every storm of life that besets his pathway. GIVE ME A MAN that has exhausted his VITALITY—suffering from PAINS AND ACHES — MENTAL DEPRESSION — SLEEPLESSNESS — NERVOUS DEBILITY — WITHOUT HOPE — AMBITION —COURAGE gone—drifting with the tide — and I can transform him into a STRONG MAN—a man of push—a man that will make his way in spite of all obstacles—if he has anything left to build upon, if he will follow my advice and use the DR. McLAUGHLIN ELECTRIC BELT as I direct. S ve your tobacco money for a few weeks—cut out a few of your health-destroying, soul-destroying habits—procure on of these appliances—USE ELECTRICI Y, and use it in the right way to invigorate your body, and you will look upon the day you gave your case to me as the TURNING POINT of your life.

Mr. Alex. Marr, Russell, Ont., says: "Anyone who is skeptical about your Belt, tell them to write to me. I feel like a new man."

Dear Sir,—I am able to say that I believe I am completely cured of Rheumatism. I have not felt a sign of it for two months, and I can recommend your Belt to any sufferer of Rheumatism.—Fred Lemon, Bognor, Ont.

Dear Sir,—I am pleased to report a good account as regards my health. I am beginning to find myself stronger in every way. Certainly your Belt does its duty and its work is sure. — William P. Morter, Box 87, Hawkesbury, Ont.

Dear Sir,—I wish to say that your Belt has done me more good than all the medicine I ever took. I used it every night for about three months, and since then I do not need it. I can sleep good, and feel as good as ever I did. I am only too pleased that I made up my mind to get your Belt. You hav my permission to use this letter if you wish, as I will be only too pleased if it will help anyone to get a cure.—Yours sincerely, John Hunt, Davisville, Ont.

Dear Sir, — Peceived your letter of the 4th inst., and in reply I can say that your Belt gave entire satisfaction. With best wishes, I am, Sir, yours very truly, Ernest Ryerse, 106 Queen St., St. John, N.B.

Cultivate cheerfulness. It pays Energy and cheerfulness — that's a combination that can't be beat. Feed your system with this great Invigorator—Electricity. Apply it with my Belt—the only correct system, and it will overcome your weakness, your pains, your aches. Animal vitality, that's what you lack. If you want to feel strength and energy in every part of your system; if you want to feel the life-blood dancing through your veins; if you want to make your mark in the world, build up your vitality with my Belt, and you can be a Man among Men.

FREE TO YOU

Call at my office, or mail this coupon with your address, and I will send you my beautifully illustrated 80-page book, full of good news to weak men, and free for the asking.

Farmers Meetings.

A very interesting and instructive series of farmers' meetings have been recently held in Lunenbury county, N. S., under the auspices of the Lunenburg County Farmers' Association. The speakers were W. H. Woodworth, President of the Nova Scotia Farmers' Association and L. D. Robinson, both well known throughout the province as successful institute speakers and practical farmers. Mr. Woodworth delivered excellent addresses on general farming including the feeding of more stock on the farm, the better care of manure and the vital importance of keeping up the supply of vegetable matter or humus, in the soil.

The food products of the farm could be fed to dairy stock more profitably than to beef cattle. There were three ways of maintaining an adequate supply of humus in the soil; 1st, by applying stable manure; 2nd, by practicing short rotations; 3rd, by plowing in cover crops. The best place to keep manure was in a cemented basement where hogs were allowed to run. When thrown out under the eves of the barn more than half the value of stable manure was often lost. A four years rotation was recommended, 1st year roots grown on sod plowed down the previous fall, 2nd year grain, seed to clover principally, 3rd year hay, 4th year hay. Mr. Robinson awakened much interest in the question of fertilizers. He did not think that chemical manures could take the place of stable manures on the farm, as the latter contain all of the elements of the plant food and large supplies of humus, while the former contain only three of those elements and no humus. But owing to wasteful methods of farming in the past and the large quantities of farm products consumed in cities, it was absolutely necessary to use more or less chemical manures. The speaker did not favor using manufactured fertilizers. There were two objections to their use, they cost more and were not suitable to the various crops to which they were applied. It cost on an average about $8.50 to manufacture a ton of complete manure including rebaging, etc., the farmer could do his own mixing for about 75c. Different crops need the elements of plant food in different proportions. For mangels the most important food is nitrogen, for turnips phosphoric acid, for potatoes, potash, for cereals nitrogen and phosphoric acid, for clover phosphoric

SEALED TENDERS addressed to the undersigned, and endorsed tender for Breakwater at Point Sapin, N B.," will be received at this office until 4 p m , Tuesday, May 9 1911, for the construction of a Breakwater at Point Sapin, Kent County. N. B.

Plans, specification and form of contract can be seen and forms of tender obtained at this Department, at the offices of E. T. P. Shewen Esq., District Engineer, St. John. N B., Geoffrey Stead, Esq., District Engineer, Chatham, N B , and on application to the Postmaster at Point Sapin, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works equal to ten per cent. (10 p. c.) of the amount of the tender, which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary

Department of Public Works,
Ottawa April 10, 1911.

Newspapers will not be paid for this advertisement if they insert it without authority, from the Department.

BRUCE'S SEEDS

BRUCE'S BIG FOUR FIELD ROOT SPECIALTIES.

Bruce's Giant White Feeding Beet—The most valuable Field Root on the market, combines the rich qualities of the Sugar Beet with the long keeping, large size and heavy cropping qualities of the mangel. ¼ lb. 13c, ½ lb. 19c, 1 lb. 30c, 4 lbs. $1.10, postpaid.

Bruce's Mammoth Intermediate Smooth White Carrot—The best of all field Carrots. ¼ lb. 23c, ½ lb. 39c, 1 lb. 60c, postpaid.

Bruce's Giant Yellow Intermediate Mangel—A very close second to our Giant White Feeding Beet, and equally easy to harvest. ¼ lb. 13c, ½ lb. 19c, 1 lb. 30c, 4 lbs. $1.10, postpaid.

Bruce's New Century Swede Turnip—The best shipping variety, as well as the best for cooking: handsome shape, uniform growth, purple top. ¼ lb. 18c, ½ lb. 24c, 1 lb. 40c, 4 lbs. $1.40, postpaid.

FREE—Our handsomely illustrated 104-page catalogue of Vegetable, Farm and Flower Seeds, Plants, Bulbs, Poultry Supplies, Garden Implements, etc., for 1911. Send for it.

John A. Bruce & Co., Ltd., Hamilton, Ontario
Established 61 Years.

acid and potash. No one mixture could be used economically for all these crops. It is much more economical to buy the elements or plant food, nitrogen, phosphoric acid and potash and compound a fertilizer to meet the needs of individual crops. He showed that a potato manure containing more plant food than the best on the market could be compounded by the farmer at a cost of less than $35.00 per ton. The following formula was suggested: 500 lbs. nitrate soda, 1100 lbs. acid phosphate and 400 lbs. muriate or sulphate of potash, the latter preferred. This could be mixed as easily as the materials for making cement.

The farmers of our county should be alive to their interests and try to make our County Association a success. We now have 156 members for 1911 and 128 of these subscribers for the Maritime Farmer. Send along your names to the undersigned, 25c. will make you a member or 60c. will make you a member and give you the Maritime Farmer for one year.—J. L. DELONG, Secretary, Union Square, N. S.

Utilizing Farm Wastes

When an animal dies upon the farm instead of sending the carcass to the phosphate factory or dumping in some out-of-the way place, if the body is reduced by the owner, several loads of the best fertilizing material will be the result. The carcass should be drawn to a suitable spot and placed upon a bed composed of four or five loads of soil or muck, then covered thickly with quicklime and at least a dozen loads of soil placed upon it. Let it remain undisturbed for nearly a year and the result will be several dollars' worth of a good fertilizer for all crops. In this way all dead animals may be utilized, using less soil or muck as size of animals warrants.

Bones furnish valuable fertilizing material also and should be saved. To 100 pounds of bones add the same quantity of wood ashes, 25 pounds of lime, and 12 pounds of salsoda finely pulverized. Let remain about three weeks. Add water to moisten well, moist. After decompsing it should and add more water so as to keep be turned out upon a dry place and mixed with dry soil to prepare it for use.

If diluted sulphuric acid is poured over bones, they will be ready for use sooner, and will prevent escape of ammonia. Caustic lye may be used also in reducing bones speedily.

A good fertilizer is made by gathering the refuse from pigpens and poultry houses, with muck, leaves and wastes of different kinds. Stable manure may be added.

Unslaked lime should not be mixed with manure, as better results are had by the use of lime and ashes by themselves; if used together a large portion of the ammonia will be liberated and wasted. But if a large amount of soil, muck or other absorbent matter is added to the compost, then ashes or lime may be used, as the carbonic acid will be produced in decomposition in sufficient quantity to take up the ammonia as fast as it is set free.

A cow produced in a year about 3½ cords of solid manure, and three cords of liquid manure. This, if all saved, would equal in value her milk. Yet not one out of 20 farmers save or make an effort to save the liquid manure. It is comparatively easy to construct a water-tight basin in the stable yard in which liquids may be deposited. Gutters can be made at the rear of cow stables and the liquid refuse carried from there to the basin in the yard.

By turning to account all the farm "waste" mentoned many dollars can be saved which have been heretofore spent in the purchase of commercial fertilizers.

The Paint That Is Easiest To Apply

is surely the paint you ought to buy when there's anything you want to paint. M-L Pure Paint spreads so evenly and easily that it satisfactorily covers more surface than most other paints.

M-L MAPLE LEAF **PURE PAINT**
Best You Can Buy

also leaves the smoothest, glossiest surface—and takes the least paint to do a good job. Wears longest, too. Any surface it covers will not need re-painting for the longest possible time. That's why M-L Pure Paint is by far the most economical paint you can buy. Try it. Note the clear, clean colors and the beautiful gloss it gives. Only purest materials and skilful mixing can make paint like that!

THE exceptional durability of M-L Pure Paint is due to a special ingredient which we alone have learned how to mix with other pure materials to make a paint that is not easily affected by extremes of wear or weather. You get the biggest money's worth in M-L Pure Paints.

Made in 47 colors for all paint uses by Imperial Varnish & Color Co., Limited, Toronto.

USE M-L FLAT WALL COLORS to obtain pleasing and artistic treatment of walls and ceilings. Best for up-to-date stencil decoration—sanitary, washable, durable, very economical. 16 shades. Easily applied. Full directions with can.

These Toasted Corn Flakes are made from the choicest white corn, thoroughly steam cooked and mixed with Malt Honey. Note the exclusive Pluto pattern of the semi-porcelain dishes found in each package of

ORANGE MAIZE

PILES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write to day to Mrs. M. Summers, Box P. 309, Windsor, Ont.

GET READY FOR THE HARVEST AND AVOID THE RUSH.

L. JR. CAR.

You can insure yourself against the scarcity of labor and also have a profitable summer's work by installing one of **Louden's Hay Carriers** in your barn. These are the cars that never fail to give satisfaction.

Write us for free catalogue. We manufacture a full line of barn equipments. Hay Carriers, Feed and Litter Carriers, Barn Door Hangers, Cow Stanchions and Stalls, Pumps, etc.

A full stock of above goods is kept at St. John, N. B., and Truro, N. S.

LOUDEN MACHINERY CO., - - Guelph, Ont.

When writing advertisers please mention The Maritime Farmer.

It will pay you to start your letter with the words: "I saw your adv. in The Maritime Farmer."

IF YOU ARE A FARMER

this letter will show you the way to make money in your leisure hours—and a means of keeping the boys at home by giving them a business of their own.

Wm. Keithley, of Superior, writes about

"IDEAL" FACE DOWN CONCRETE BLOCK MACHINES

"Bought an Ideal when business was at low ebb—not enough to keep one man busy. Very soon, I was rushed with Ideal work. This year, made and sold more material than two red brick yards and two cement competitors. Money comes in hand over fist".

You can do it too. Make concrete blocks for houses, barns, silos, foundations, fences, etc.—take contracts for Ideal Concrete Blocks in place of brick or stone. There's money in it.

Our book explains everything. Write for free copy.

IDEAL CONCRETE MACHINERY CO. LIMITED
Dept. M, LONDON, Ont.

A $5.00 Wire Fence Prize.

We will give $5.00 in gold to the person who finds the word "fence" or "fences" the most times in ads. in this and succeeding issues between now and May the 31st. It doesn't cost you one penny to try for this $5.00 but in looking for the word "fence" note which fence ads. interest you most, and write those advertisers, sending an order or asking for free catalogue. In your letter to us telling how many times you find the words "fence" or "fences" you must give us the names of all fence advertisers in this and succeeding issues up to May 31st, to whom you have written mentioning The Maritime Farmer. This is an easy condition, and the catalogues or fences you buy will be worth much more than you pay. Go to work. The $5.00 will be mailed promptly to one finding them most times. Tell how many times you find them on each page. In case of tie the prize will be divided. Don't delay. Don't cost a cent to enter. You might as well have the $5.00 as you are going to write for catalogues, so do it now. Lists must be mailed by May 31st, 1911.

E. L. Colpitts, Dept. F. **PETITCODIAC, N. B.**

Charlottetown Prices.

GRAIN.—Oats, white, 34c; black, 36c; buckwheat, 60c to 75c.

FEEDSTUFFS.—Bran, retail, $1.30 to $1.35; shorts, $1.40 to $1.50; middlings, $1 45 to $1.50; oil-cake, $2.25 to $2.50; corn meal, $1.60.

GRASS SEEDS.—Timothy, 13c to 15c; common red clover, 20c to 22c; mammoth red clover, 20c to 22c; alsike, 20c to 22c.

LIVE STOCK.—Butcher's cattle, 6c to 6½c; stockers, $20.00 to $35.00; milch cows, $30.00 to $60.00; sheep, $3.75 to $5 00.

DRESSED MEATS.—Beef (carcass), 8½c to 11c; beef (retail), 11c to 16c; mutton (carcass), 9c to 10c; veal (carcass), 4½c to 5c; pork, light, 7c; select, 7¾c; heavy, 7c.

HORSES.—Drafters, $150.00 to $250.00; roadsters, $150.00 to $225.00; carriage, $150.00 to $225 00.

DAIRY PRODUCTS.—Creamery butter, 24c to 24½c; dairy butter, 20c to 22½c

POULTRY AND POULTRY PRODUCTS.—Eggs 15c to 15½c; fowl, 10c to 12c; chickens, 10c to 13c

FRUIT.—Apples, $3 50 to $5 00.

VEGETABLES.—Carrots, 50c to 75c per bush.; potatoes, 50c to 55c per bush.; turnips, 20c per bush; beets, 40c to 50c per bush.

MISCELLANEOUS.—Hay, $7.00 to $8.00 per ton; straw, $5 00 per ton; beef hides, 8c to 8½c; calf skins, 12c; sheep hides 60c to 75c.

There is little change since our last report. Roads are not good and very little heavy produce is being offered. The winter steamers have succeeded in reaching Charlottetown and we expect no further trouble with transportation this season. Several cars of potatoes have been loaded along the line of the P. E. I railroad and have been forwarded to Sydney and we understand good prices have been realized by shippers. The price paid to the farmers is, we learn, 50c per bushel. Pork is lower and supply offering is sufficient for requirements and market is easy. Oats are dull and price easy. Feeds, such as bran, shorts, oil cake and middlings, are very scarce and prices quoted are nominal. Butter is scarce, but demand is easy and prices are not advanced very much. Eggs are lower and demand and supply are both good. Beef is very high and reported not in heavy supply.

St. John Prices.

GRAIN.—Oats, 44c to 50c; peas, $1.85 bush; barley, $1 00 to $1.30 bush; buckwheat, $2.00 to $2.25 bush.

FEEDSTUFFS.—Bran, $26.00 ton; middlings, 28½c to 29c; oil-cake, $2.00 per hundred; linseed meal, 8c per lb.; corn meal, $1.35 per hundred.

GRASS SEEDS.—Timothy, 15c to 18c lb.; common red clover, 18c to 20c lb.; mammoth red clover 20c to 22c; alsike, 18c to 20c.

LIVE STOCK.—Butchers' cattle, 5c to 5¾c; stockers, 4c to 4½c lb.; milch cows, $40.00 to $50.00; sheep, 9c to 10c; lambs, 11c to 13c; hogs, 9½c to 10c.

DRESSED MEATS.—Beef (retail), 9c to 20c; mutton, 9c to 16c; veal, 8c to 12c lb.; lamb, $4.00 to $5 00 carcass; pork, 9½c to 10c.

HORSES.—Drafters, $225.00; roadsters, $200.00 to $225.00; carriage, $200 00 to $210.00.

DAIRY PRODUCTS.—Creamery butter, 26c to 28c; dairy butter, 25c to 27c; cheese, 13c lb.

POULTRY AND POULTRY PRODUCTS.—Eggs, 18c to 20c; fowl, $1 50 to $2.00; ducks, $1.00 to $1 25 pair; geese, $1.25; turkeys, 25c to 28c.

FRUIT.—Apples, $4 00 to $6 00; strawberries, 40c box; honey. 35c qt: $1 25 per gallon.

VEGETABLES.—Carrots, $1.25 to $1.40; potatoes, $2.00 to $2.25; turnips, $1.00; beets, $1.25.

MISCELLANEOUS.—Hay, $11.00 ton; $10.00 car lots; straw, $6 50 to $8 00; wool, 21c lb.; beef hides 9c; calf skins, 15c; sheep hides, 25c to $1.00; lamb skins, 10c

We had good Easter market and prices were high. Good potatoes are in demand at good prices. There is a good stock of Western beef this week. There is a lot of Montreal horses on the market this week and they are asking high prices, $275 00 to $300.00. Our own province bred horses is in good demand at good prices. Pork is falling off—a poor supply this week. The river is open and I think there will be a change in the prices in the next two weeks.

To show you that our ad. in THE MARITIME FARMER is bringing results, I will give you a few of our sales during the last several months. To D R Nicholson, Coxheath, C. B., the fine two year old heifer, Josco Posch, and her heifer calf. This heifer won first prize at St. John and first and sweepstakes over all other pure breds at Sydney exhibition the last fall and is giving a good account of herself at the pail, milking over 45 lbs a day, after being shipped to Sydney. To W. C. MacLeod and Sons, Loch Lomond, West C. B., a fine bull out of Blanche Lasanda, a daughter of Frau LaHanda, well known at Amherst dairy test. To Hugh Fraser, Elmsdale, N. S., a good young bull, Cobequid Robert. To Oxley H. Steele, Scots Bay, N. S., a bull out of Nellie Mercedes Beauty, first prize three year old over all breeds at Amherst test in 1909. She has an official record of 17½ lbs. butter in 7 days at three years old; her dam is Locust Hill Nellie 3rd, record 21.8 bs. butter in seven days. To C. A. Munn, Leitches Creek, C. B., Grace Wayne Johanna, first prize three year old at Amherst test in 1910. To Fox Harbor Agricultural Society a bull out of Lottie LaHanda, record 17¾ lbs. butter at 13 years old. To Harding Bros., Welsford, N B., the cow, Artis Pietertge Poem. To N. M Beckwith, Middleton, N. S., a son of Locust Hill Nellie 3rd, first and champion at Halifax in 1909. To Fred S. McLellan, Portapique, N. S., a fine heifer from Locust Hill Benie. To William Patriquin, Londonderry, N. S., a young bull sired by Helbon Dekol's Prince. To Wm Mullally, Gowan Brae, P. E. I., a fine bull sired by Sir Rooker Posch Artis. To Cleveland Agricultural Society a yearling bull sired by Artis and from Lottie LaHanda. To Black River Agricultural Society a young bull sired by Mercena Vale. To W. P. Fowler, Hammond Vale, N. B., a fine pair of calves for a foundation. Our cattle are coming through the winter in fine condition. Milking 24 cows, 15 of them two or three years and they have averaged over 1,000 lbs. a month each all winter.—SAMUEL DICKIE, Central Onslow, N. S.

APPEARS ON WRAPPER

Ruberoid Roofing

Trade Mark Registered. Pronounced RUE-BER-OID.

PROTECTS FROM FIRE

When Campbellton, N. B., was destroyed by fire on July 11th and 12th, 1910, the only business building left standing in the town was roofed with RUBEROID. An all-night shower of sparks and burning brands failed to ignite the Ruberoid.

When the Brussels International Exhibition Buildings were practically wiped out on August 14th, 1910, five kiosks roofed with RUBEROID remained intact right in the centre of the fire-swept area

Why not use RUBEROID and be safe?

Ask your dealer for Ruberoid samples and Booklet G. or write us and we will mail them direct.

"SOVEREIGN" Sheathing felt is the best interling you can put in a house.

Ask for sample and booklet.

PAQUET GUARANTEED CLOTHES

New Style Book Ready for Mailing

WE have much pleasure in announcing that our new 1911 Style Book of PAQUET Guaranteed CLOTHES for Men is now ready. The values this season are better than ever—the patterns are new and attractive—the styles right up to the minute.

We GUARANTEE that the prices quoted in this Style Book are the lowest in Canada for the same value—the same amount of style—the same quality—the same careful workmanship.

For $10.00

You may have your choice of six different patterns in high-grade tweeds, serges and worsteds, delivered PREPAID to your nearest Railway Station.

For $15.00

The selection is better than ever. The materials are exceptionally fine, pure wool worsteds—and we pay delivery charges to any part of Canada.

Write TO-DAY for this Style Book

Don't put it off until some other time. Sit right down and write us NOW. A postcard will do. You'll get the book and samples of materials by return mail.

THE PAQUET COMPANY LIMITED.

QUEBEC, CANADA.

TALK TO TEN THOUSAND FARMERS for a few cents a day, through a little "Want" Ad. in The Maritime Farmer. Think of it! Try it if you have any live stock, farm produce, lands or machinery you wish to sell.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad. as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

HELPS THE SICK TO GET WELL

A GOOD FRIEND TO GIN PILLS

If you want to know what GIN PILLS will do, ask anyone who has ever used them. Then you will learn the plain, unvarnished truth about the greatest Kidney Remedy known to modern science.

It is the enthusiastic praise of thousands who have been cured, which has done so much to make GIN PILLS known in every section of Canada.

The letter below is only one of many that show how GIN PILLS are regarded by those who have used them.

VANCOUVER, B.C.

"I think it my duty to tell you that GIN PILLS are a sure cure for Kidney Trouble and La Grippe. I suffered so much with my kidneys and La Grippe until I used GIN PILLS, and now would not be without them in the house. I shall always recommend GIN PILLS to anyone I know is suffering with their Kidneys."

MRS. M. BUTLER.

GIN PILLS are sold on a positive guarantee of money refunded if they fail to give relief. 50c. a box—6 for $2.50. Sample free if you write. National Drug and Chemical Co Dept. MF Toronto.

MANGA-TONE BLOOD & NERVE TABLETS are the ideal tonic for pale, thin people. 50c. a box—6 for $2.50. 64

PILES CURED at HOME by New Absorption Method.

If he cannot supply the MARVEL accept no other, but send stamp for illustrated book—sealed. It gives full particulars and directions invaluable to ladies.

WINDSOR SUPPLY CO., Windsor, Ont. General Agents for Canada.

Tar and Turpentine.

It was away back in the day of the little red schoolhouse that the gentle, sweet-faced school mistress questioned a class of rosy-cheeked, barefooted, frontier lads as to the chief products of North Carolina. The question was surely and promptly answered "tar and turpentine." It was not, however, until we began the shepherd life that we found the true value of these products of the Old North State. These two reliable articles should always be at hand in successful sheep keeping. As a disinfectant they stand upon their own merits and the healing power of each is fully proven.

Pure pine tar is an excellent remedy for colds or cough and all lung disorders in sheep. A daub of tar upon the tongue will afford much relief. Tar upon the sheep's nostrils during the midsummer months will go far in warding off the gad fly. The gad or sheep bot fly is the cause of nasal grubs. This treatment is also beneficial in cases of catarrh. Where an entire flock is troubled with the catarrh or "snuffles" as many sheepherds term this ailment, the burning of a tablespoon each of tar and turpentine mixed will prove a great boon. To do this mix the two articles together, pour into a large pan and set fire to the mixture. This smudge treatment is of course done within the sheepfold. Drive the flock in, close the doors and windows in order to hold the fumes. Be sure to stay in the fold with the sheep and see that the smudge does not become too dense. It will not harm you but will prove a benefit to your lungs also. In case the smoke is too dense open windows until it has thinned down somewhat.

A mixture of pine tar and castor oil, equal parts, forms a great healing ointment for all forms of sores or shear cuts. It is also excellent to apply at time of docking or castrating to ward off flies and keep out germs. The best ointment, however, we have ever tried for foot scald, bad wounds, etc., is composed of pine tar, castor oil, powered sulphur and coal tar dip, all equal parts, and mix thoroughly. This will heal both man and beast after all else has failed. Turpentine should never be put upon a raw or fresh wound as it is too severe and will cause agony, but it is grand for healing wounds where poison or gangrene threatens.

There is certain healing power in turpentine where germs have gained entrance to a sore. In case of flyblow turpentine is the remedy. It will put the fly larvae, maggot, out of commission in less time than it takes to tell the remedy. We have cured foul wounds, wherein the maggot was causing diseased flesh, with simply turpentine. Use a spring bottom oil can for the injecting. Turpentine and lard, one part of the former and three parts of the latter, will form an ointment which cannot be excelled in the treatment of inflamed or caked udder in ewes. Rub and massage thoroughly, but not upon the nipples as this would be repulsive to the lamb. This treatment is also of value where cases of inflamed udder occur at weaning time.

You will note at a glance the value of these two very common and inexpensive drugs. They are worth their weight in gold in the life saving virtues of their composition and should be more often used in place of some untried remedy, the make-up of which you know nothing. In cases where the "old reliables" have failed you may rest assured the "new fangles" will prove of naught. The products of Nature, the life blood of the stately pine tree, tar and turpentine will heal where healing is possible.—Harry Wheeler.

AN IHC MANURE SPREADER MEANS NEW LAND ON THE OLD FARM

THOUSANDS of people during the past year paid fabulous prices for new land—gave up their savings and their homes and moved into unknown country just for the sake of securing more productive property.

Hundreds of farmers found a better plan. They stayed at home and invested in an I H C Manure Spreader a small part of what it would have cost them to move to the new country.

Now in leisure time during the winter they are returning to the soil the rich fertility that has been drained from it—making new land out of old—putting it into condition to yield bumper crops.

With an I H C Spreader the manure can be distributed in the proper amount required by the condition of the soil. A light coat, where land is good, a heavy coat where it is most needed.

I H C Manure Spreaders have many exclusive features which you ought to know about. Years of successful service has shown their superiority. In buying an I H C machine you are assured satisfaction, for they are backed by a company that cannot afford to risk its reputation by offering you anything but the best.

I H C Spreaders are made in two styles—

Corn King—Clover Leaf

in varying sizes suitable for any size farm.

The Corn King is of the return apron type—Cloverleaf Spreaders have endless aprons. Lime hoods for spreading lime and drilling attachments for distributing manure in rows are furnished on special order.

Let the I H C local dealer tell you all about I H C Spreaders and how you, too, can turn your manure pile into money with one of these simple, efficient machines. Catalogues can be secured from him, or, by writing nearest branch house for them.

The N. B. Government Sale of Pure Bred Live Stock.

The live stock sale by the New Brunswick Provincial Department of Agriculture at the Fredericton Exhibition Grounds, on April 12th was largely attended and highly successful.

Following are the names of animals sold, purchasers names and amounts received:

SHORTHORN BULLS.

The Major, consigned by J. B. Snowball Company, Chatham—Wicklow, Wilmot and Kent Agricultural Societies, Carleton County, $105.

Bonaparte, consigned by J. B. Snowball Company— Douglas and Bright Agricultural Society, York County, $145.

Chatham Lad, consigned by J. B. Snowball Company—Hanford Dunphy, Nashwaak Village, $110.

Wm. Underhill, Blackville, $80.

H. O. Huestis, Kings Co., $105.

AYRSHIRE BULLS.

Sir Walter, imported by Provincial Government from Ontario—M. A. Smith, Hoyt Station, $120.

Cherry Bank, imported—Pokemouche Agricultural Society, Gloucester county, $85.

Sir Allan, of Elmview, imported—Stanley Agricultural Society, York County, $90.

Sir Andrew of Elmview, imported Thomas Riordon, Gloucester county, $85.

Burnside Snow King, imported —

HOLMAN, "The Gypsum Man."

Sells Gypsum Direct to Farmers and Farmers' Clubs.

Gypsum [Land Plaster] stops the tremendous waste that annually occurs in your manure heaps; use it liberally in your stables and help to keep them in a sani tary condition; sprinkle it on your potato sets and it will keep them without shrivelling and in a vigorous condition for growth, even if they are cut a long time before they are planted; use it on your dry soils to conserve moisture and on your wet soil to help sweeten it.

Gypsum is cheaper than lime and has a more favorable effect on the soil, as it does not liberate the stored up plant food in excessive quantities.

I have installed a plaster mill and am now prepared to grind Gypsum at my Sussex quarries. Write me for prices on car, ton or hundred weight lots. It would be extravagance to farm without using Gypsum when I can quote you such low prices.

Wm. A. HOLMAN, "The Gypsum Man,"

SUSSEX, - - N. B.

HAD HEART TROUBLE

LIFE WAS A BURDEN

MILBURN'S HEART AND NERVE PILLS CURED HIM.

Mr. Elexander McKay, Port Philips, N. S., writes:—"Seeing testimonials in the B.B.B. Almanac of how many poor sufferers had been helped by Milburn's Heart and Nerve Pills, I thought mine would not be amiss. I am a man of fifty-four years, and have a family of five children. About two years ago I was a sufferer from heart trouble, and life was a burden to myself as well as others. I could not lie on my left side and sometimes I would nearly choke, and was very nervous and run down. My father, a very old man of eighty-five years, told me that he often heard people recommend Milburn's Heart and Nerve Pills to be a great cure so thought it would do no harm to give them a trial, but I had very little faith in them. My wife went to the store and got me two boxes, and before I had used the last of the first box I noticed a change, and before the second box was done I was cured and am a well man to-day."

Price 50 cents per box, or 3 boxes for $1.25 at all dealers, or mailed direct by The T. Milburn Co., Limited, Toronto, Ont.

Covered With Eczema.

On March 21st, 1910, Mr. Angus McMillan, of Port Hood, N. S., wrote us:

"My little boy three years old was covered from head to foot with eczema. I tried over twenty different kinds of salves and washes but could not see any improvement—in fact it seemed to be getting worse.

I was about discouraged and had lost faith in all kinds of so-called eczema cures, when I saw an ad. telling about D. D. D. Prescription. I sent for sample bottle and the third application convinced me that I had at last got a sure cure. Two bottles effected a complete cure."

What D.D.D. did for this little boy, it will do for any skin suffer. A mild, soothing liquid made up of Oil of Wintergreen, Thymol, Glycerine and other ingredients, it penetrates to the root of the trouble and washes the disease germs out,

Why not get relief? Simply write to-day to the D. D. D. Laboratories, Dept. F. M., 49 Colborne St., Toronto, and they will send you a free trial bottle.

(For sale by all druggists.)

Chamberlain's Stomach and Liver ablets assist nature in driving all mpurities out of the system, insuring a free and regular condition and restoring the organs of the body to health and strength. Sold by all dealers.

"A stitch in time saves nine"

Painting at regular intervals saves money. It protects the lumber and greatly increases its length of service. A coat of good paint applied when needed will double the life of your house so that at the end of 25 years it will be practically as good as new. If you neglect to paint, decay is bound to set in and your house will soon deteriorate 50 per cent.; renewal costs will then more than double the amount you would have expended had you painted regularly. If they need it, paint your house and barns this year. Ask the local S-W dealer for SWP—a good paint, that will last. *The Little Paint Man.*

SHERWIN-WILLIAMS PAINTS & VARNISHES

Sherwin-Williams Paint, Prepared (SWP) is made from pure white lead, pure zinc, pure linseed oil, and the necessary coloring pigments and driers.

Sherwin-Williams Varnishes are made from the best gums, pure linseed oil, pure turpentine, and are thoroughly filtered and aged. They spread and wear well.

THE SHERWIN-WILLIAMS CO.

HOMESEEKERS' EXCURSIONS

The Grand Trunk Railway has issued a circular authorizing all Agents in Canada to sell Homeseekers' Excursion tickets to points in Western Canada. This is interesting information for those desiring to take advantage of these excursions on certain dates from April to September 1911. The Grand Trunk Route is the most interesting, taking a passenger through the populated centres of Canada, through Chicago, and thence via Duluth, or through Chicago and the twin cities of Minneapolis and St. Paul. Ask Grand Trunk Agents for further particulars.

Hotbeds and Cold Frames.

The common method of starting plants of garden vegetables for early use is the hotbed. The hotbed consists of an enclosure covered with glass and furnished with bottom heat, usually fermenting manure. The time of starting and the a ount of heat required depends upon the local condition.

As a rule the hotbed should not be made in the garden enclosure, but near some frequented path or building where it can receive attention without interfering with other work. The hotbed should always face to the south or the southeast and should be protected from west and north winds by a building, high board fence or a wind break of evergreens.

The proper time to start the hotbed depends upon the time that you want the plants to set to the open field. From six to eight weeks is required to develop most of the common garden plants to a size suitable for transplanting to the field. It is best not to start the plants too early as when once stunted, a plant never makes a good crop.

In the extreme north all preparations for making the hotbed should be made in the fall of the year.

It is also better if the preparations are made in the fall in all sections, as then the excavating and framing of the pit, also the storing away of rich soil in which to plant the seeds may be done when the weather is pleasant and the soil is dry.

A temporary hotbed, such as would ordinarily be employed on the farm, is easily constrdcted by the use of manure from the horse stable as a means of furnishing the heat. Select a well drained location, where the bed will be sheltered, shake out the manure into a broad flat heap, and thoroughly compact it by tramping. The manure heap should be two or three feet wider and that much longer than the frames to be used. This will give a more lasting and uniform heat.

After the manure has been tramped and leveled, the frames to support the sash are placed in position facing toward the south. These frames are generally made to carry four standard hotbed sashes, which are usually 3x6 feet. The front board should be about eight inches and the back about twelve. This gives the plants room to develop and also sufficient fall to drain off the water. Four or five inches of good garden soil or rich loam should be spread evenly over the area enclosed by the frame. Place the sash in position immediately and allow the bed to heat up. Do not plant any seed in the bed until the heat begins to subside, which will be in about three days after the sashes have been put in place. When the temperature has fallen to 85 or 90 degrees, planting may be safely begun.

As the hotbed is one of the most essential features on the farm, it is economy to build a permanent one.

THE PERMANENT HOTBED.

A pit two to two and one-half feet deep, according to the latitude in which the work is to be done, should be provided. The sides and ends may be planked up with one or two inch stuff, or better still, a brick wall nine inches thick may be used. But I find a wall made of concrete the most satisfactory. In either case the pit lining should come flush with the surface soil. The site for the pit should be on naturally well drained land, and a tile drain from the bottom of the excavation should be provided to prevent the water from accumulating in the pit and stop the fermenting of the manure during the period the hotbed is in

INTERNATIONAL CARRIAGE CO.,
BRIGHTON, - Dept. "F," - ONTARIO

use. The plank frame or the brick work of the pit may be extended above the surface of the ground sufficiently to allow for placing the sash immediately upon these permanent structures. In autumn the pit should be filled with leaves or straw and covered with loose boards or shutters to prevent it from being filled with snow and ice and in order that it may be ready for use early in March.

CARE OF HOTBEDS.

At the north, in addition to the glazed sash, board shutters, straw mats, or mats of burlap or carpets will be needed as an additional protection during cold nights.

During bright days the hotbed will heat very quickly from the sunshine on the glass and it will be necessary to ventilate during the early morning by shoving the sash to one side just a little. Care must be exercised that there is no direct draft upon the plants at any time. Toward evening the sashes must be closed in order that the beds may become warm before nightfall.

WATERING.

Hotbeds should be watered in the morning only, and then only on bright days. Watering at night is dangerous, as the operation necessitates the lifting of the sash and the loss of the accumulated heated air, and the water itself lowers the temperature of the soil, so that in cold weather there is greatly increased danger to the plants from frost. Then too, the excessive moisture resulting from dampening the leaves and confining them during the night provides congenial conditions for the development of mildew and damping-off fungus. After watering, the bed should be well ventilated to dry the foliage of the plants and the surface soil, to prevent the plants from being lost by this damping-off fungus or mildew.

COLD FRAMES.

Cold frames are devices intended to protect plants from cold, without forcing them to growth. They differ from hotbeds in that there is no artificial heat used.

The cold frame in its simplest form consists of a frame covered with heavy canvas, to keep off the frost and chilling breezes.

TRANSPLANTING THE SEEDLINGS.

It is sometimes necessary to transplant the seedlings into a second hotbed, one with a milder heat than the first one. This is where the beds are started very early, and the plants are to be used for very early trade. They are then transplanted to the cold frame to harden them off ready for the final transplanting to the open field.

As plants of different vegetables require different degrees of heat to do their best, it is advisable to plant in different hotbeds. Seeds of cabbage, cauliflower, onion, beets and celery do not require as great a heat as tomato, egg plant, peppers and melons and should be planted in different beds.

Your tongue is coated.
Your breath is foul.
Headaches come and go.
These symptoms show that your stomach is the trouble. To remove the cause is the first thing, and Chamberlain's Stomach and Liver Tablets will do that. Easy to take and most effective. Sold by all dealers.

Pedlar Culvert comes in half-sections for economy in shipping and ease in handling. Easily put together, tighter and better than any riveted or bolted-joint can be.

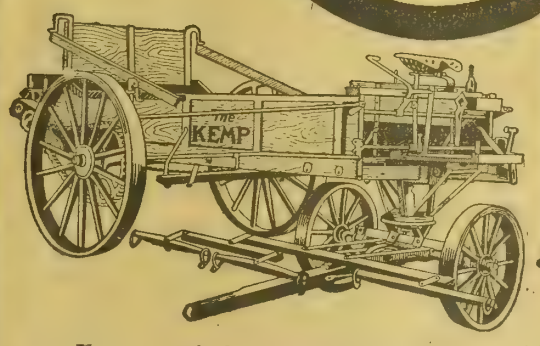
A few hours work puts this modern, permanent culvert in place, so it won't wash out or need repairs. Easily laid by anybody. All sizes—8 inches to 6 feet in diameter. Strong, durable.

It should interest you greatly to know how little it would cost you to use this better Culvert instead of a make-shift that is always giving you trouble.

Where you bridge over ditches and drains you'd find Pedlar Culvert the easiest to lay and the most economical you could use. Let my book make it all clear to you. Write NOW. 412

At least one-third lighter draft

Genuine **Kemp** Manure Spreader



You can only buy one manure spreader with the Reversible, Self-Sharpening, Graded Flat-Tooth Cylinder—and that is the Genuine Kemp.

Because of this Graded Flat-Tooth Cylinder the Genuine Kemp is at least one-third lighter draft than any other spreader.

There is less friction on the Flat-Tooth Cylinder, because the teeth are wide and graded. On that account only one-third as many teeth are required, which reduces the friction when the manure is passing through the cylinder.

The square or round teeth on ordinary cylinders are not wide enough apart and the manure backs up, chokes cylinder, causing heavy draft.

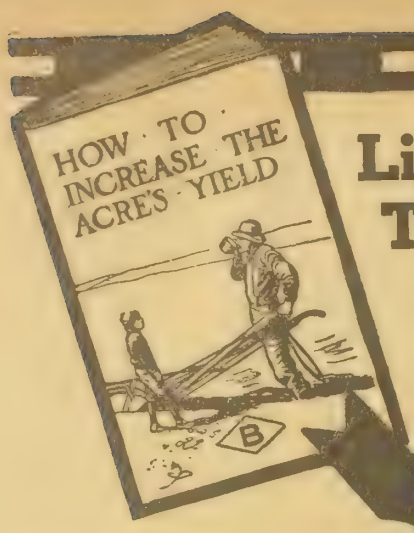
The manure cannot back up against the flat teeth, and because the flat teeth are graded they will handle and thoroughly pulverize all kinds of manure from the clear gum to the strawy material.

There are many other exclusive improvements on the Genuine Kemp. Our big catalog describes and illustrates them fully. Send for a copy and learn some new facts about manure spreaders.

There would be twenty times as many manure spreaders in use in Canada today if farmers realized the economy of spreading manure with the Genuine Kemp. The Genuine Kemp will pay for itself faster than any other farm machine.

But send to us for catalog B 62 That's your first step. We are sole selling agents. 62

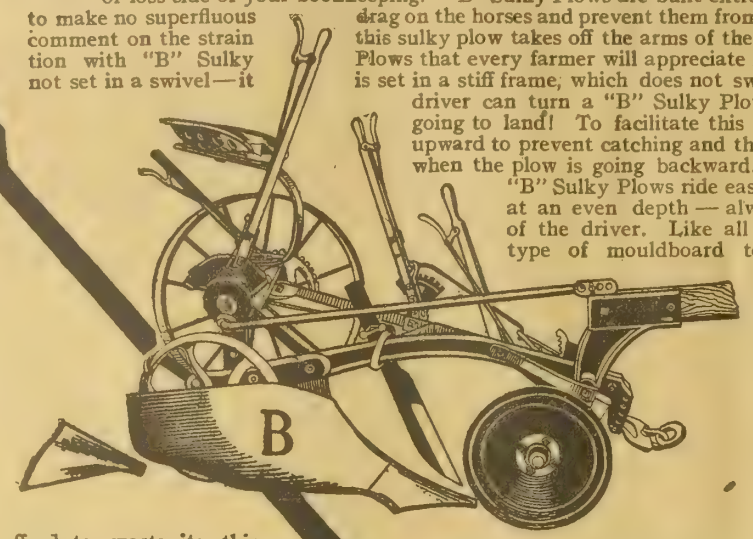
FROST & WOOD CO., LTD. SMITH'S FALLS, CANADA



Light Weight Combined With Strength Makes This Plow Stand For Profit On The Farm

WEIGHT and strength are the two essentials in a sulky plow—the strength is needed to stand the wear and tear, of course, and on the weight depends to a large extent whether the plow is to stand on the profit or loss side of your bookkeeping. "B" Sulky Plows are built extra strong for heavy work and still light enough to make no superfluous comment on the strain tion with "B" Sulky not set in a swivel—it drag on the horses and prevent them from covering the ground they should in a day. To this sulky plow takes off the arms of the driver is unnecessary.. One point in connec- Plows that every farmer will appreciate is the action of the rear wheel. This wheel is is set in a stiff frame, which does not swing to right or left. The result is that the driver can turn a "B" Sulky Plow around backward—and know where he is going to land! To facilitate this back-up, the rear of the sole is also rounded upward to prevent catching and the colter also tilts automatically on the beam when the plow is going backward. It does not catch in roots and stones.

"B" Sulky Plows ride easily, cut evenly, turn a good furrow, and work at an even depth — always. They are always under full control of the driver. Like all "B" Plows, they are fitted with the exact type of mouldboard to suit the soil where to be used. This mouldboard, of course, is made from soft-centre steel. "B" Sulky Plows enable you to get more work out of your horses without driving them to anything like the exhaustion the ordinary plow demands—even in tough, sticky soils—they will scour anywhere—wet ands have no terrors for "B" Sulky Plows. Why not let a "B" Sulky Plow, backed by the Belanger reputation, save money, time and horseflesh for you—why not buy your plow on the basis that you are going to make it earn enough extra to pay for itself?



This is the light draft "B" Sulky Plow

If your dealer does not sell "B" Plows, write us and we'll tell you where you can see them.

FILL OUT THE COUPON GET THE BOOK FREE

THIS book is an authoritative work on the preparation of the ideal seed-bed,—the foundation of good crops. To buy this book would cost you a dollar, but if you are really interested and will fill out the coupon as an evidence of good faith, we will send you one copy of the complete volume FREE. The story is told in three chapters, — "Soils and Fertilizer," "Plowing and Plows," and "Seeds and Seeding." Each chapter deals with its subject fully, tells the whole story and tells it in such detail that its genuine, practical value to the active farmer is unquestioned.

Your invested capital is your land—your great asset—and you cannot afford to waste it; this book tells you about the most modern methods of conservation — facts which you owe it to yourself to know.

Value of Bees in Agriculture.

To give an idea of the value of bees in agriculture, it is stated by a German writer than an ordinary colony during summer contains an average of 20,000 foragers. Of these 80 fly from the hive to the pasturage every minute; therefore, taking the working hours as from 7 o'clock in the morning to 5 in the afternoon, 48,000 flights would be made. During each flight every bee visits at least 50 blossoms. This amounts in round numbers to 2,000,000 for the hive in one day. It is reckoned that there are on an average 100 fine days when bees are able to fly, consequently 200,000,000 blossoms may be fertilized by the bees of one colony When only one-tenth of these blossoms are properly fertilized by bees, it leaves the enormous number of 20,000,000 fertilizations to each colony.

The Beekeeper.

The beekeeper would be greatly benefited by better information as to the functions of the bee in fertilizing flowers. At present it often happens that there are times when bees are looked on as very deterimental, but if the apiarist has an array of actual facts to present in place of the generalities now indulged in by the journals, it would have more weight with municipalities which try to banish bees, and in similar cases.—E. F. Phillips, U. S. Dept. of Agriculture.

CARBONOL
"NECESSARY AS SOAP"

HEALS, CLEANSES, DISINFECTS.

Carbonol is indispensable to raisers of Poultry and Live Stock. An interesting booklet, fully describing its many uses, will be sent with free sample on request.

Saves Time, Labor and Expense

Frost and Wood Crown Gang Plow

We urge you to do your plowing this season with the "Crown" Gang Plow instead of using single-furrow walking plows—or riding plows. The "Crown" turns two furrows where the ordinary walking plough turns one. It turns the furrows faster, cleaner, more evenly, too. You walk twice as far, and take more than twice as long, to do the same amount of work with a single-furrow plow as you can do with the "Crown" Gang.

But why walk at all? Why not use a riding plow, you say? Simply because it isn't good business to do so. When you use a riding plow you hitch on one more horse than the single-furrow plow needs. The extra horse is not to do the work faster. It is needed to pull your extra weight around the field. Now, can you afford the expense of that extra horse merely to enjoy the luxury of riding? Why not use the extra horse on the "Crown" Gang and break twice as much ground?

Just do a little figuring for yourself and you'll prove that the "Crown" Gang will pay for itself in one season in the time, labor and expense it will save you. If you would like your figures verified, send for booklet B 46 which shows how the 'Crown' Gang will save you $15 per week.

46

There is a difference in gang plows same as in hired men. You are liable to get hold of a mighty poor-working gang plow, just as you are to get hold of a hired man who barely earns his salt. It pays to take precautions.

We can give you a big list of progressive farmers who swear by the "Crown" Gang — who say it is the surest, steadiest, fastest-working plow they have ever seen or used. The "Crown" is not, like so many others, an old "failure" which has been rebuilt or remodelled. The "Crown" is a plow on which we spent a good long time, and no little cash, to perfect. It was not placed on the market until it had been tested many months under various soil conditions in different sections of the Dominion. We knew the "Crown" was a "success" before we made a single sale, and it has made a record we are proud of.

It's the perfect shape of the mouldboards that makes the "Crown" Gang turn the sod so easily and produce such clean-cut, beautifully even furrows. It's because they are made of soft-centre crucible steel and highly polished that they scour so quickly. The wheels are guaranteed dust-proof, too. And they have roller bearings—which lightens the work for the horses.

Once you set the plow you need not touch the easy-working, conveniently-located levers again. The "Crown" Gang will stay right down to its work and withstand the hard strains of plowing through heavy land. The "Crown" is so sturdily built that it will triumph where an ordinary plow will fail you. So just make up your mind you'll own a Frost & Wood "Crown" Gang Plow this season. You can purchase both sod and stubble Bottoms for the same frame. You can have either Straight or Rolling Coulters or Skimmers.

Turns Two Clean, Even Furrows in Same Time Single-Furrow Plow Cuts One.

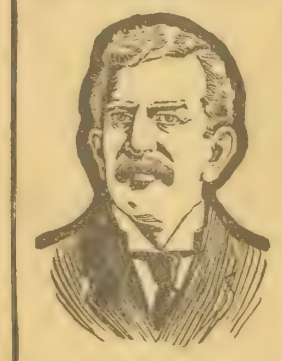
A Word to the WIVES is Sufficient

OR perhaps I should say "wise"--though it means the same. I speak especially to Canadian women in this advertisement. Because I know that most women are WISHING for a beautiful home, a safe home, a comfortable home, such as Pedlarizing provides at least cost. If any man reads this I'd like him to think about it from his wife's standpoint. Every man owes it to his wife and family to build the most attractive, most durable home he can. Also provide the best possible protection against the disastrous results of fire and lightning. Protection against the discomforts of bad weather, too. You, madam, should see to it that he does. Get my book about Pedlarizing. Look into it with him. Figure out the cost. I'll help you. You'll find Pedlarizing makes the best building you could wish for, yet costs no more than a common-place frame house. My book is Free. Won't you please write for it? Do so now, lest you forget.



EVERY woman who takes pride in her home gets enthusiastic over the many advantages of Pedlarizing. Especially when she knows that it really costs less than any other respectable kind of building.

When I speak of "Pedlarizing" I mean sheathing any building, outside and in, with my several forms of **fireproof sheet steel.** Oshawa Steel Shingles for the roof, guaranteed in writing to make a good roof for 25 years. Pedlar Steel Siding for outside walls, looks like brick, fancy cement blocks or dressed stone. Pedlar Art Steel Ceilings and Sidewalls for inside—in almost endless variety of tasteful designs.

Of course it is the best to "Pedlarize" a building completely. But you could start with Pedlar Art Steel Ceilings and Side Walls for one or more rooms. Or for the new roof use Oshawa Steel Shingles. Or make your house look like a new brick or stone one with Pedlar Steel Siding.

Send for my book anyway. **Then** you can talk it over with "hubby" and decide as you think best.

Sincerely your friend,

E. A. Pedlar

Will Your Husband Build a Fire-Trap?

A very important question—important to your happiness, comfort and peace of mind. Yet you know as well as I do that most frame houses are mere fire-traps. Over 60 per cent. of all fire loss is on frame buildings. Even in cities, with prompt efficient fire-protection, the frame house is a 'goner' even with only a small blaze to start it. Its inmates are lucky to escape with their lives. If one room gets ablaze the whole building is mere kindling to feed it, and other nearby frame buildings easily catch fire. You know this. But do you know that at same cost "Pedlarizing" will make your home and other buildings practically fireproof, far safer than ordinary brick buildings.

Pedlarizing Makes a SAFER Home Protects from BOTH Fire and Lightning

By "Pedlarizing" I mean protecting the building inside and out with steel, like they do the big sky-scrapers nowadays in cities. Oshawa Steel Shingles for the roof, guaranteed in writing for 25 years. For the outside walls, Pedlar Steel Siding, looks like brick, fancy cement blocks or fine cut stone. Inside walls and ceilings finished with Pedlar Art Steel, chosen from over 2,000 beautiful, artistic designs. Such construction is actually cheaper by 20 per cent. than commonplace frame buildings. The **SAFETY** it insures makes it **WORTH** double.

Pedlarizing Makes a More ATTRACTIVE More SANITARY, More DURABLE Home

My nearest warehouse will gladly send you **FREE** a large splendidly-illustrated book, picturing the interior of numerous fine churches, schools, public buildings, stores and private homes in city and country which have been made most attractive at least cost with these Pedlar specialties. The little pictures in this advertisement faintly suggest the beautiful, artistic results that are economically secured. Pedlarized rooms are easiest to keep clean. No crevices or cracks to harbor dust or vermin—walls and ceiling easily washed with soap and water. No papering to fade and peel off. As for durability—well you know what to expect of **STEEL.**

Pedlarizing Makes a More COMFORTABLE Home--Warmer in Winter, Cooler in Summer

You can easily understand that a solid, seamless covering of sheet **steel** over a roof and outside walls, and **again** on ceiling and walls inside, is **double**-protection. Bars out winter's cold winds, keeps in the warmth and thus saves fuel. Neither can the heat of summer's blazing sun find its way in. Pedlarized buildings are damp-proof too—kept dry and comfortable through all kinds of weather.

Pedlarizing Costs Far Less Than You Think

Your husband may jump at the conclusion that because Pedlarizing makes buildings so much better in every way than frame or brick construction, it surely must cost "more than he can afford." Why not get the facts—then decide. He'll find Pedlarizing actually cheaper by 20 per cent. than ordinary frame buildings. Ask him to send for my book—or write for it yourself. Then you can show him how much it does and how little it costs.

Let Me Send You My Big FREE Book Full of Pictures and Facts of Great Interest

My book about Pedlarizing is an expensive one. It shows many of the 2,000 beautiful designs of Pedlar Art Steel. Also pictures of many private homes, stores churches, schools and public buildings, that show how Pedlarizing has made better buildings at least cost. I wish you would write for a copy of this book. I am sure it will interest you very much. Gladly sent entirely free if you write me, at address nearest you. (See below.)

Ask for Pedlarizing Book No. 17

Oshawa-Shingled Roofs Are Fire and Lightning-Proof--- Can't Leak, Rot or Rust

I give a you a signed, legally-binding written guarantee that's good for a new roof **free** if Oshawa Shingles fail in any particular to make a perfectly good roof for every day of 25 years. No other roof is guaranteed like this. You can guess why.

Outside Walls of Pedlar Steel Handsome, Wind-Tight, Fire-Proof

This little picture can only suggest the attractiveness of Pedlar Steel Siding. Nothing cheap-looking about it. Made to look exactly like beautiful cut stone, fancy cement blocks or brick. Very economical.

Pedlar Art Steel Ceilings and Side-Walls Both Adorn and Protect

You can choose from over 2,000 artistic designs. Carry out any decorative scheme. No crevice or seam to harbor dirt. Can be washed with soap and water. Kept clean with least effort. Never crack. Never get damp. Best kind of fire-protection. So inexpensive, too.

YOU Can Furnish Your Home FREE!

ANY housewife buying goods at the stores mentioned below may have their cash purchases apply on **Asepto Soap Premiums.** Every cent you spend counts toward a premium. A sure and mighty convenient way to save without increasing living expenses. Over 300 premiums of honest value to select from. The list will be increased every few weeks. Furniture will be offered next. The old way was to allow premiums to apply on Soap Wrappers only. Now at any of these stores—no matter what you buy—everything has its equivalent in Soap Wrappers. That is every five cents spent counts the same as one wrapper, while purchases of our goods as here advertised entitles you to two coupons—the one the merchant allows and the ones found in or on our goods themselves.

Dr. White's Honey Balm.—A cough syrup that is safe and sure. We are positive that no other cough syrup equals it. Price 25c. Equal to 5 soap wrappers.

Pendleton's Panacea.—The best hot medicine, in use nearly 100 years. Every person knows it is good. Price 25. Equal to 5 soap wrappers.

Brown's Cutilive.—A witch-azel cream for chapped hands, sunburn, etc. Price 25c. Equals 5 soap wrappers.

Scott's.—Salts, Senna, Sulphur, Saltpetre, Borax and Alum in 5c packages. Equal to 1 soap wrapper.

Brown's Spearmint Tooth Paste—Sweetens the breath, prevents decay, hardens the gums and whitens the teeth. Price 25c. Equals 5 soap wrappers.

Napatho Soap.—A pure laundry soap, containing naptha and incorporated by a process that prevents it from hurting the hands, as other Napatho Soaps do. The wrappers count for Premiums.

Sapid Tea.—A blend selling at 40c, in 1 lb. packages only. Blended by J. Harvey Brown, one of the most competent tea men in Canada. Each package carries a coupon equal to 8 soap wrappers.

Dr. Scott's White Liniment.—The largest bottle and best liniment. Price 25c. Equal to 5 soap wrappers.

Banner Flavoring Extracts.—All flavors and from 10c to $1.25 per bottle. Coupon on each bottle.

Herner's Dyspepsia Cure.—The only kind that tells you to eat what you like while taking it. Money back if not good. Price 35c. Equal to 7 soap wrappers. Price $1.00. Equal to 20 soap wrappers.

Brown's Stomach and Liver Pills.—A good family pill. Price 25c. Equals 5 soap wrappers.

Scott's Furniture Polish.—Renews the life of old furniture. Price 25c. Equals 5 soap wrappers.

Asepto Soap.—Is equal to the best and contains the same anti septic features that Asepto Soap Powder does. The wrappers count for premiums.

Scott's.—Nitre, Glycerine, Iodine, Iron, Squills, Friar's Balsam, Carbolated Oil, Camphorated Oil, Castor Oil, Sweet Oil, Oil of Tar, Sewing Machine Oil, Spirits of Camphor. Price 10c per bottle. Equal to 2 soap wrappers.

Scott's Fruit Syrups and Lime Juice.—Pure and excellent flavor. 10c, 15c and 25c. Coupon on the bottle.

Ebony Polishes—None better, both paste and lustre. Coupon on each box. Try them.

Banner Spices.—In packages only. Absolutely pure. ¼ lb. packages carry coupon equal to 2 soap wrappers.

Venus Floating Soap.—Made from pure vegetable oils and unexcelled for the toilet and bath. Price 25c. Coupon counts for premiums.

Asepto Soap Powder.—Has been the greatest success of any soap or powder ever put on the market. This is the best evidence of its quality. It is antiseptic as well. It absolutely sterilizes every article washed. Think what this means to a family. Price 5c, and the trade mark counts for premiums.

HOLMAN, "The Gypsum Man."

Sells Gypsum Direct to Farmers and Farmers' Clubs.

Gypsum (Land Plaster) stops the tremendous waste that annually occurs in your manure heaps; use it liberally in your stables and help to keep them in a sanitary condition; sprinkle it on your potato sets and it will keep them without shrivelling and in a vigorous condition for growth, even if they are cut a long time before they are planted; use it on your dry soils to conserve moisture and on your wet soil to help sweeten it.

Gypsum is cheaper than lime and has a more favorable effect on the soil, as it does not liberate the stored up plant food in excessive quantities.

I have installed a plaster mill and am now prepared to grind Gypsum at my Sussex quarries. Write me for prices on car, ton or hundred weight lots. It would be extravagance to farm without using Gypsum when I can quote you such low prices.

Dwarf Essex Rape The Great Foliage Plant

Its Use and How to Grow It.

RAPE is a plant of the Brassica family, that is of the same family as the cabbage and turnips. In the early stages of its growth it can scarcely be distinguished from the rutabaga, but as growth progresses it does not form a root bulb such as is formed by the rutabaga. The leaves and stems are the only portion of the plant used as food. The leaf and stem growth are completed in from ten to twelve weeks from the date of sowing the plant. The growth then ceases until the following spring, when it begins again and produces seed in climates that are sufficiently mild the following summer. Summer rape amd also bird rape will produce seed the same season that they are sown, but these are practically useless in providing pasture.

THE USES OF RAPE

Bird rape is sown to provide seed that is suitable for feeding birds. Summer rape is grown chiefly to provide seed from which oil is expressed. It is comparatively useless in providing food for live stock.

DWARF ESSEX RAPE is grown chiefly to provide pasture for horses, cattle, sheep and swine, but more especially to provide grazing on which sheep may be fattened with or without an additional grain supplement. In America, Dwarf Essex Rape is grown almost exclusively to provide pasture on which sheep may be thus fattened, to provide good grazing for young calves and also for swine. It is also grown to provide grazing for beef cattle.

Although rape is of comparatively recent introduction into America, it has been grown as food for live stock in Great Britain and Continental Europe for more than a century. Prior to 1890 It would seem correct to say, that not more than 1000 pounds of rape seed were sold in our year in all North America to provide grazing for live stock. Now it would seem safe to say, that 10,000,000 head of sheep and lambs are fattened every year, and great numbers of cattle and hogs, on the Dwarf Essex Rape plant.

Placing, Size and Waxing of Scions.

These Fameuse trees, on farm of S. L. Peters Queenstown, N. B., were 24 years old when top-grafted to Bishop Pippin and have succeeded splendidly.

OF RECENT INTRODUCTION

This wonderful forage plant is of comparatively recent introduction into this country. Prior to 1890, as already intimated, the plant and its merits were comparatively unknown on this continent. Since the beginning of the century, however, its growth in America has been rapidly extending. So rapidly has it come into favor, especially in providing pasture for sheep and swine, that it would be hazardous at the present time to set any limits that would encircle its growth in the future.

WHERE RAPE MAY BE GROWN

Dwarf Essex Rape may be grown in every province of Canada and in every state of the American Union, but the conditions for growing it in these are by no means favorable. To grow at its best, raue calls for a climate moist and not excessively hot, nevertheless, excellent crops of rape may be grown where the climate is dry rather than moist, providing the temperature is not too high. It would seem safe to say that rape may be grown successfully in all parts of the North temperate zone, but more successfully northward than southward except on the higher elevations, as the tropics are approached.

SOILS FOR RAPE

The best soils for rape are those that are friable, moist, rich in vegetable matter and well supplied with a sufficiency of moisture. Sandy loams underlaid with clay will grow good crops of rape. Clay loams are even better, as they contain more humus. Slough soils free from stagnant water are most excellent, because of the large amount of vegetable matter which they contain. Raw peaty soils are not good, being deficient in available plant food. Sandy soils and those that are gravelly with but little admixture of earth in them do not hold moisture sufficiently well to grow good crops of rape and stiff clays do not push the plants forward so as to make a rapid growth. Good crops of rape may be grown on all the soils of the average prairie lands of the entire Canadian West. Any lands that will grow good crops of wheat will grow good crops of rape. Nevertheless, the more that lands are judiciously manured with farmyard manure, the better will be the crops of rape obtained from them. It is a mistake to sow rape on poor land.

ROTATION FOR RAPE

Rape may be given any place in the rotation when it is grown alone, but not with equal fitness. When grown broadcast it should be sown on land at least reasonably clean or weed growth may choke it. It grows well on overturned sod, as the roots feed ravenously on the humus which it furnishes. When grown on weedy land the aim should be to grow it as a cleaning crop. This means that it would be grown on much the same plan as the rutabaga, and that the cultivation given should be very similar. As a rule rape should be followed by a crop of grain as it leaves the land reasonably enriched and also manured on the surface, especially when it has been grazed down by sheep. When grown in mixtures it may be assigned almost any place in the rotation.

PREPARING THE SOIL

When preparing the soil for rape the aim should be to have a seed bed, clean, smooth, fine, well-pulverized near the surface, and firm below. When sown broadcast on stubble land, the aim should be to plow the land in the early fall to bury weeds that might otherwise go to seed, to disc and harrow the same in the spring at suitable intervals to sprout weed seeds in the soil which would be destroyed in turn by each succeeding cultivation given. Where the sowing is late the land may thus be fairly well cleaned before the rape is sown. When sown in mixtures the preparation that is suitable for the other factors of the mixture will also be suitable for rape.

SOWING RAPE ALONE.

When rape is sown alone it may be sown anytime after the cereals have been put into the soil, but the best crops are grown when the sowing is deferred until, say, June 1st, and is completed by the end of June. But it is possible to grow good crops of rape during any part of the

growing season that is seventy-five days without killing frost! It would be easily possible to destroy young plants in the spring by untimely frosts, but rape will stand considerable freezing in the autumn without taking harm. As rape is ready to be grazed down in from six to ten weeks from the date of sowing, pastures of the same may be furnished in succession by sowing the rape at intervals.

When sown broadcast it may be sown by hand, by using the knapsack or wheelbarrow seeder or by the grain drill when the latter sows the seed too thickly, when sown alone, it may be mixed with some other substance as dry earth before sowing it, when sown in rows it may be sown with the grain drill with a proper distance between the rows, or with a machine such as is used for sowing sugar beets. When sown in raised drills, use a machine such as is used for sowing rutubagas. The raised drills should be low rather than high. The distance between the rows is from 24 to 36 inches, with say 30 inches as a favorite distance on land of moderate fertility, and 36 on land that is rich.

The soft soils of the prairie should be pressed down before sowing the seed so as to make them firm. On the other hand, stiff and clodfy soils if used at all should be made fine. The amount of seed to sow on the broadcast plan is about three pounds per acre on well prepared land, but on land less productive a little more seed may be helpful. If the harrow is to be used on the crop after it is up, from four to five pounds of seed may be used to allow for loss of some of the plants. When sown in rows, from one to two pounds of seed will be enough.

The average depth at which to sow is from one to two inches, but on soft prairie soils when moisture is lacking it may be necessary to bury the seed one inch deeper. With ample moisture shallow burial is the better. When sown broadcast and covered with the harrow, the depth of the burial is uneven, which is of course against even and uniform germination; more plants will also be destroyed if the harrow is used on the crop sown thus than if drilled in.

SOWING RAPE WITH SPRING GRAIN.

The practice of sowing rape along with the gain meets with much favor in areas where grain is extensively grown. The idea is to provide grazing for live stock after the grain has been harvested. More commonly the rape is sown along with the grain by mixing the seed with the same while in the grain box, but it may be mixed previously. When the grain drill is furnished with a grass seed attachment, the rape seed may be allowed to fall before the grain tubes the harrowing that usually follows sowing provides an abundant covering for the seed. This method of sowing is to be preferred to the former. On very rich ground, when the fear is present that the rape may grow so as to hinder the harvesting, and curing of the grain, the sowing of the rape should be deferred until the grain that has been sown just begins to show. The rape seed may then be sown and the crop harrowed judiciously. The harrowing that covers the rape seed will also greatly benefit the grain crop if given at that stage.

Rape seed thus sown will usually not grow up so as to hinder the growth of the grain, but after the grain is cut, in moist weather it will make a vigorous growth and will furnish much pasture for horses, cattle, sheep and swine. It is not wise to pasture it by milch cows, as such pasturing unless very carefully done will produce taint in the milk. In a moist autumn the grazing thus produced may prove of much value, especially in providing grazing for the fattening of sheep and lambs, but should the autumn weather prove very dry, the results may be disappointing. However, the loss in such instances will be very slight, as usually the amount of seed sown is about one pound per acre. In some instances it may reach two pounds. Should the rape not be wanted for pasture, it makes a good plant to plow under in order to supply the land with vegetable matter.

A good plan on our Western grain farms is to sow rape broadcast, either alone, or in combination with peas, wheat, oats or barley, on summerfallow after the cultivation is completed along in June. In a short time the growth will be sufficient for big herds of live stock, affording the best of feed and serving another important provision in firming the land and putting it in best condition for wheat the following season.

SOWING RAPE IN OTHER COMBINATIONS

Rape has been sown in various combinations to provide pasture. For instance, it has been sown with grain of one or more varieties to provide pasture for swine. It has also been sown with corn and millet to provide pasture for sheep, but it is at least questionable if any gain results from growing it thus over growing it alone. Usually a much better growth of the rape plants will be secured when the crop is sown alone. This statement, however, should not discourage the growth of rape amid crops of grain grown on the prairie, for in such instances the rape is usually obtained without injury to the grain, and where sheep are grazed on it subsequently, they not only get the benefit of the rape, but also of the fallen heads of grain.

A Grade Heavy Draught Quartette.

The four horses, above shown, were exhibited as a four in hand at the 1911 Maritime Horse Show. Owned by Forrest Bros., Amherst Point, N. S.

CULTIVATING THE CROP

When rape is sown broadcast it is usually not cultivated in any form. But there are instances in which it may be harrowed with profit, especially when it has been sown with the grain drill. By running a harrow over the ground when the rape is almost ready to appear, the teeth being given the greatest possible backward slant, many weeds just starting may be destroyed. If not done then, the harrowing should be deferred until the plants are three to four inches high.

When sown in rows that are far enough apart for cultivating, the harrow may be used before the plants come up as indicated above, providing the seed is sown on the level. The cultivation between the rows should then begin as soon as the plants can be traced along the line of the row. It should be frequent enough to keep the ground clean between the rows, and it should be continued until leaves meet between the rows. It is not necessary to thin the plants in the line of the row. Where the aim is to clean out weed growth one hand hoeing along the line of the row will be necessary.

PASTURING RAPE

Rape is par excellent a pasture for fattening sheep. It is good also for growing cattle and for fattening cattle, but because of their broad hoofs they waste more than would be wasted by grazing with sheep. It is excellent as a pasture for calves. It is good as a pasture for swine and excellent as a pasture for swine and excellent as a pasture for fowls.

When sheep or cattle are first turned in to graze upon it they should only be allowed to remain on it for a short time, say half an hour for the first day, for a longer period the second day and for an increasingly long period each day until it becomes safe to leave them on the pasture, which will be in about a week from the time of the first grazing. In no instance should the animals be turned in to graze when hungry. The danger is that cattle and sheep may eat the rape so ravenously that gas will be produced in the stomach to such an extent that the bloating which ensues may cause death by suffocation. Such hazard is not present when the crop is grazed by horses or swine. It is always greater in proportion as the rape is succulent and in proportion as it is wet with dew or rain.

When sheep are fattened on rape, in some instances they are given a liberal supply of wholesome food and are turned in on the rape, and thence forth they are allowed to graze on it at will. This plan, though the easier of the two, is not so good as the plan which introduces them to the rape gradually, as in the latter instances the digestion is less disturbed. The sheep will fatten all the better, and the same holds true of cattle, when they may also graze at will on an old grass pasture while grazing on the rape. There is something in the dry or partially dry grass which tends to lessen the tendency to looseness in the bowels which sometimes results from feeding on the rape. Salt should also be placed where it will be at all times accessible, as it also tends to prevent scouring.

One acre of rape well grown will fatten ten to fifteen head of sheep and lambs, dependent upon the size of the sheep and on the strength of the crop. It will accomplish this in eight to ten weeks and without the aid of grain. The increase made per animal will be about ten pounds in thirty days, but if grain is fed at the rate of say one pound a day, the grazing will be so far prolonged. Sheep graze down rape with a minimum of loss. On a field of well grown rape they eat clean as they go, or virtually so, until they have gone over the field. The more mature the rape is, the more valuable is the food that it furnishes, hence, the aim should be to have it well grown before the sheep are turned to graze on it. Swine may be turned in while it is yet more immature, as they prefer to eat rape while it is quite succulent. When eaten down before maturity it will grow again, but it is doubtful if it will furnish as much pasture as if not eaten down until it is mature. The aim should be to have the rape grazed down before freezing comes that is hard enough to make the stems brittle. Even when they thaw out again they do not furnish a very satisfactory food.

RAPE AS A SOILING FOOD

Rape is excellent when cut and fed green after it is well grown. When thus fed it may serve a good end in feeding swine that are confined to the pens, in feeding sheep and lambs and also young cattle that are being fitted for the shows. When thus fed there is no danger from bloating, providing it is allowed to wilt a little before it is fed, or if fed fresh, when quantity is limited. It may also be fed to dairy cows, providing the milk has been withdrawn. When the feeding takes place soon after rape is grown for soiling, the aim should be to grow it near the buildings, for then it is always convenient to the place where it is to be fed.

INFLUENCE ON THE LAND

Rape is not a legume, but notwithstanding it does not impoverish the land that produces it, as many other non-leguminous crops do, and for the reason that in nearly all instances it is fed off on the land on which it grew. It thus leaves the fertility on the land in a readily available form. The fertility thus brought up from the lower stratas of the soil is deposited near the surface where the next crop grown can at once begin to feed upon ie. When sheep are grazed on a rape field and when at the same time they are fed a rich supplemental grain ration, no quicker or cheaper method could be adopted of fertilizing that field. Rape cannot be harvested and carried away like other crops and it cannot be easily preserved as ensilage.

Even when it is not pastured it may exert a most beneficial influence on grain fields in the prairie provinces where many crops are grown in succession. The growing of these crops takes the vegetable matter out of the soil so that it is unable to hold moisture properly, and it also lifts with the wind. There is no cheaper way of renewing this supply than by sowing a pound or two of rape along with the grain sown on each acre and plowing the plants under in the fall when they grow. No plant has been introduced in recent decades that has given more return for the money invested than Dwarf Essex Rape.

A Prize of $5.00

We will give $5.00 to the school boy or girl who makes the most number of words from the letters contained in the word "Alfalfa." No letter is to be used in one word oftener than it appears in the word "Alfalfa". The only condition is that each person competing must send in at least one paid in advance new or renewal subscriber to "The Maritime Farmer." Make up your lists boys and girls, show them to your friends, get them to help you win the prize by subscribing for The Maritime Farmer. Contest closes May 30th. Address Circulation Manager, Maritime Farmer.

ROOT GROWING IN NOVA SCOTIA

By F. L. FULLER Truro, N. S.

The turnip crop is one of the most important crops that Maritime live stock raisers produce and in compliance with the requests of a large number of our readers we re-publish the following article:

The experience of the writer of this article dates from the time he was big enough to pull a turnip. The early part of my life was spent on a farm where turnips were considered an important crop. This particular farm contained a great variety of soil, in fact, everything from gravel to the hardest clay, and I have seen, a good crop of turnips growing on every acre of it.

During the first two years of the existence of the Experimental Farm at Nappan, I was employed there. Colonel W. M. Blair, who was then manager, was a firm believer in root culture, and although the fields presented an unfavorable appearance we succeeded in getting a fair crop of turnips. The turnip crop at that farm has occupied an important place in the rotation ever since its inception, and I have never seen less than 800 bushels per acre, and have seen as high as 1200 bushels. When I took charge of the Agricultural College Farm fifteen years ago, I determined to grow roots extensively, but was advised by farmers in the vicinity to go cautious, as the soil was not adapted to the growth of roots. We began with one acre, and have increased until last spring when Mr. Logan took charge, there was a 10-acre field prepared for roots The yield for the fifteen years has averaged about one thousand bushels per annum.

METHODS OF GROWING

Our root crop either follows a clover sod or a hay field which has grown a crop of oats the previous year. If the former we plow at three or four inches deep as soon as possible after the clover is taken off. We then roll and harrow immediately. The rolling and harrowing early in the season greatly assists in rotting the sod, thus putting the field in shape for the following season. Later in the season we manure at the rate of about 25 loads per acre and plough again somewhat deeper than before. This time we do not harrow as we wish to leave as much surface as possible exposed to the beneficial action of the frost. If a stubble field is to b? used the only difierence in the above treatment would be that we would disc harrow the field as soon as the oats were removed and plough once instead of twice.

While I do not consider it necessary to manure the field we always make it a point to save enough manure during the summer to give our root field a dressing in the autumn.

Perhaps the chief advantages are that you get through with quite a lot of work when time is not as precious as it is in the spring, and if the manure is coarse it will give you less trouble in the drilling and handling roots if applied in the fall.

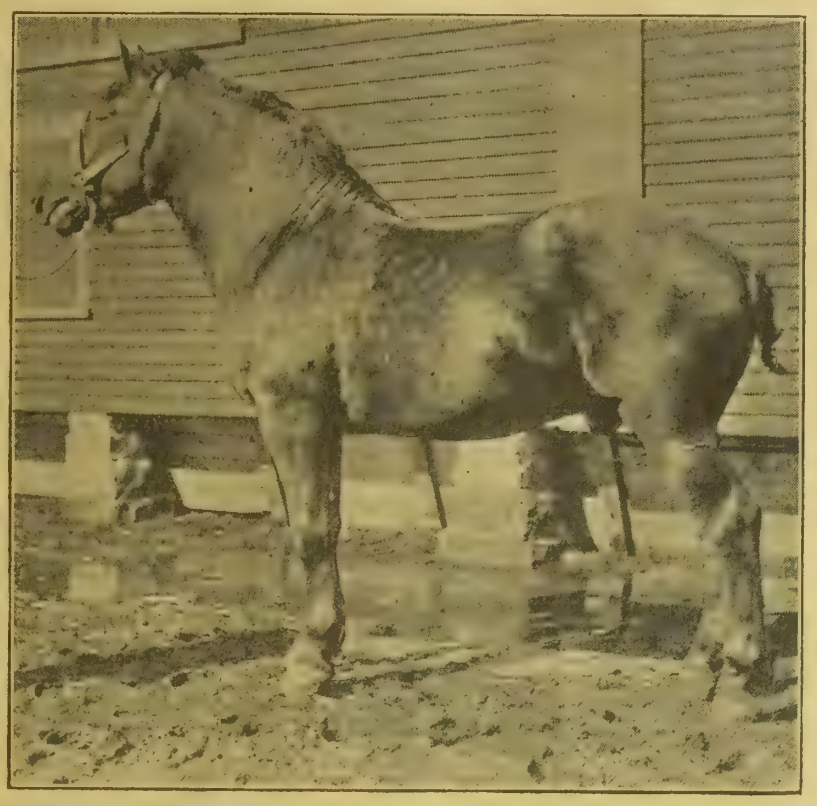
As soon as the field is dry enough in the spring we prefer to harrow it in order to start the weed seeds. As soon as we are ready the field is ploughed thoroughly, worked up, drilled, and then the seed is sown.

When drilling we use from 600 to 100 lbs. Commercial Fertilizer. This is applied by sowing in a light mark made by the drill plough and making the drill directly over it. The most profitable kind of fertilizer should be determined by conducting some simple experiments.

We soon discovered that we were getting poor returns for the use of potash and that the best results were obtained by using fertilizers containing a large percentage of phosphoric acid. Experiments along this line demonstrated the fact that where potash alone was used the increase in yield as a result cost about $1.00 per bushel, and that when acid phosphate (a purely phosphoric acid fertilizer) was used the increase yield cost only 2.9 cts. per bushel.

I do not wish to convey the impression that acid phosphate is the proper kind of fertilizer but rather to set forth the probabilities of serious loss unless some means is taken to discover what element of plant food is needed in your own particular case.

Regarding our method of sowing the fertilizer I think that equally good results would be obtained with less labor by sowing it broadcast on the land just before making the drills. Our chief reason for sowing it in the drills is that it is necessary in connection with experimental work.



Immerseif

Champion Percheron Stallion at the recent Maritime Horse Show. Imported and exhibited by A. H. Thomson, St. John N. B.

Our drills are made 28 inches apart and until a few years ago we made it a practice to drill up only the number of drills we intended to sow immediately. This was done in order to give the seeds the benefit of fresh moist earth to start germination. As this farm was badly infested with "wild mustard" I attempted to overcome it by drilling a small portion of our turnip field early in the season. This allowed all the weed seeds to germinate before it was necessary to sow the crop. When we were ready to sow the seeds we went over the drills with a chain harrow (a brush or half of a spike tooth harrow turned upside down would do) and sowed the seed immediately. This proved to be a splendid process for killing weeds. But as the season was very dry we had some fears lest the seed would not germinate well. To our surprise, however, the seed on this portion of the field came up much more quickly and grew more rapidly than on the adjoining portion of the field where the drills were made and the seed sown the same day. The following year we tried a larger portion of our field with even better results, and for the past few years have made it a practice to handle our entire root field in this way.

This system may not be suitable for all parts of Canada nor all kinds of soils but so far it has certainly proved satisfactory on the College farm.

The quantity of seed sown per acre is from 2 to 3 lbs. This is sown with a seeder imported from Scotland and which is the best machine of the kind I have yet seen. While I am aware that unless you have an absolutely reliable machine it is not safe to seed so lightly, it must be borne in mind that within the safety limit the less seed you sow the less labor you will have in thinning. I would further add that nobody should be deterred from growing turnips simply because it may be impossible to get a seeder in the neighborhood. It is not a very serious matter to sow quite a large field of turnips by hand. A bottle with a quill through the cork or a tin paint can with a hole punched through the bottom are both good devices for hand sowing. A pointed stake makes a very good implement for making a mark for the seed which can be well covered with the back of the hand hay rake.

We start the cultivation as soon as the plants are up sufficiently to enable one to follow the row and we keep it going at intervals of from a week to ten days until the leaves are so large as to prevent it.

We begin thinning as soon as the third leaf is well out, using a hoe only. The plants are left to from 12 to 15 inches apart at the first trimming.

But we find it necessary to go over this the second time to cut out plants which may have been missed during thinning and to kill any weeds which have so far escaped.

A detailed statement of the average cost of growing an acre of turnips is as follows.

In the fall of 1901 a stubble field was taken and disc harrowed as soon as the oats were taken off:

1909.	
Cost per acre of harrowing	$ .75
25 loads stable manure	25.00
Hauling and spreading manure	8.00
Ploughing field	3.00
1902.	
Harrowing field before plowing	.75
Plowing	3.00
Preparing for drilling	1.50
Drilling	2.00
Commercial Fertilizer	10.00
Sowing Fertilizer	.75
Seed	.60
Sowing seed	.50
Thinning	5.00
Cultivating	3.00
Hoeing, second time	3.00
Cr.	$66.85
By half value stable manure	$12.50
By one-third value of Com. Fertilizer	3.33
	$15.83

The yield was 1000 bushels $51.02 which would make the cost of growing 5.1 cts. per bushel. When you add to this 1 ct. or less for harvestist you still have the cost about 6 cts. per bushel.

If the items of credit for manure left in the field need any explanation I think it can be found in the fact that we expect this field to produce a crop of grain and at least two crops of hay without any further dressing of fertilizer and then expect the field to be in as good shape as it was when we began with it. If this result is obtained (and experience bears it out) I think our estimate is sufficiently low. That liberal allowance has been made for the other items will I think be generally conceded. If to anybody the amount for thinning and hoeing seems small may state that I have for several years hired a man for $1.50 per day, who did his work well and made a daily average of one half of an acre.

I am aware that some farmers would grow more roots if they had better cellar accommodation. Those who have basement stables should not be confronted with this trouble. To others I would say it is not necessary to have expensive cellars for keeping roots.

The ordinary barn usually has one main driveway or floor and a hay mow on either side, or a hay mow on one side and a stable on the other.

This floor is usually several feet from the ground, and a good cellar may be cheaply made by digging out under this floor to get a sufficient depth, and putting up ordinary wooden partitions next the hay mows. If a single partition is not considered safe, a double partition may be made of rough boards and the space between stuffed with straw.

DIFFICULTIES.

The chief difficulties that may be encountered in connection with growing are the ravages of the Turnip Flea Beetle, or "Turnip Fly," and Club Root. We often hear farmers say that they would grow turnips if it were not for the turnip fly. I am free to admit that I have seen small patches of turnips almost entirely destroyed by these pests, but have never seen a large field seriously affected and am of the opinion that as a menace to root growers this trouble is more imaginary than real. Several remedies are suggested, which are more or less effectual. The best remedy is to have your field in a good state of cultivation and use good seed. The plants will then grow rapidly, and give the fly little

HOW TO GET BETTER STOCK.

It is the wish of every one to have better stock than he now possesses. The majority have an ambition to get into some line of pure-bred live stock breeding. This is commendable. Yet there are many, who, from circumstances, feel it impossible to reach the height of their ambition.

It is through "up-grading" of our common stock that we can hope to enhance the value and usefulness of our herd.

Remember there will be no advancement, no up-grading, unless you have secured the best bred, most prepotent animal as head of your herd that is obtainable. Improvement only comes through the superior qualities of the males used.

Breeders should be warned against a grade bull. Not but what a grade bull is better than a scrub. It is true the progeny of a high grade bull may be capable of equalling even those of a pure-bred so far as production of dairy products alone are concerned, but they can never equal the progeny of the latter in prepotency or the power to transmit to their descendents their own desirable qualities. It is inherited characteristics of the pure-bred through a long line of pure-bred ancestry, with the uniformity of type and the inherent vigor of race and breed that is his value as the sire. If individuals are not so situated to own such an animal themselves it is desirable that co-operation and joint ownership by communities should be effected.

It is the general custom among purchasers of such animals to seek a young animal. It is a false economy. In fact there is a decided advantage in purchasing mature animals. One of the greatest is that the buyer can, by the character of the progeny, better judge of the animal's value and he eliminates the uncertainty of the future development of the young bull calf. Then again many a good animal is sold more reasonably at three and four years of age than when yearlings.

SQUANDERING TIME.

There is a class of people who are continually complaining that they have not time to do this or that thing. They are always busy, yet accomplish nothing. Their work is always behind. They will start half a dozen jobs and never thoroughly finish any of them. They are simply squandering time through lack of system. Such people want to take a fresh grip upon themselves and form correct habits. Let them first finish the work in hand in a thorough manner and then turn, without delay, to something else. To squander time between jobs in trying to excuse the postponement of the second job is cultivating a bad habit. As soon as a man acquires the habit of systemizing his work, completing the job in hand and immediately taking up another, he soon begins to clean up the many things that have hung on his shoulders as a regular burden. With each job completed he feels his strength increasing and soon everything seems to shape itself to his hand. When a man so lays out his work that each job is finished when it leaves his hands, he soon finds that instead of an accumulation of work he is ahead of his regular work. He is then ready to branch out into new fields which his experience has made him anxious to enter and conquer. It is a poor habit to form to try and find excuses for squandering time between jobs. To be always busy with nothing done is to gain an unenviable reputation as a poor workman.

MAKE YOUR FARM ATTRACTIVE.

We know of no outlay on the farm that can be made as profitable and make the home more attractive than the proper laying out of the home grounds. What we all want is attractive homes and this is not always made so by lavishness in selecting and planting of trees, but in the neatness and artistic arrangement. One of the reasons that many of our farm homes are not attractive is because the work is left to that season of the year, spring, when everything is pressing and no time is found for doing this work. The proper thing to do is to plan your home grounds before work commences. We often times see homes on the farms where there has been lots of money spent, abundance of planting and yet the whole is an uninviting picture, is unpleasing to the owner and much less attractive to his neighbors. The whole thing shows the lack of system and proper arranging and it is along this line that the greatest errors are committed.

Everybody likes to see a well kept lawn and the home which should adorn its centre should be so arranged that the plants, flower beds, ornamental trees, shrubs, etc., all blend in harmony and in keeping witn the surroundings, maintaining a natural grace and the proper proportions on the landscape. One common fault in planting is the overcrowding. At first this does not show, but in a very few years we begin to see the evil effects of this system. Here is where a plan should have been made and studied, and the trees and shrubs so arranged so that they have ample space for growing and as they grow older and larger they maintain the same relative position to one another for there is nothing more detrimentel to a well laid out lawn than to see certain trees and shrubs crowding each other.

It is impossible to give any minute directions for the laying out and planting of home grounds in a newspaper article, but we have plenty of men at this age of the world who are making this line of work a specialty and are only too glad to confer with anyone needing any information along this line. We know of no expenditure of money that will give as good results as the proper planting and laying out of the home grounds.

PRACTICE A CROP ROTATION.

A crop rotation planned to suit the location and carried on with a fair understanding of natural conditions, may be made to give the land greater productive power. The convenience and probable immediate profit of farm work are involved in a suitable rotation. But notwithstanding the well known benefits of intelligent crop rotation systematically carried on may continue year after year to give very little attention to this important matter.

The low average yield of many farms, their depleted fertility, the prevalence of weeds and the inferiority of pastures are largely owing to this disregard of the principles and practice of crop rotation. This same disregard of suitable crops and rotations is responsible for what might be termed the special drudgery of some farms. A variety of crops properly rotated better distributes the work of the year and enables one better to provide for live stock ; besides, one crop may more profitably follow another than itself from its leaving the soil in better condition.

The practice of cropping continuously so long as such seems profitable and then seeding down to grasses needs to be discouraged. Long terms for any one field to be in pasture are also far from being in the best interests of the land or of its owner; yet scores and scores of farmers take hay from a field so long as it will give a fair return and then use it many years for pasture. The sod, while it is not frvorable to weeds, harbors insect pests and is responsible for the depredations of wire worms and white grubs when such land again is brought under cultivation.

The short rotations, three-year or four year, have everything to commend them. These naturally cannot be applied universally. But while they are adopted only to certain conditions, longer and shorter ones under other circumstances may be made to yield satisfactory results if intelligently planned and persistently pursued.

If for any reason we have failed to give crop rotation its due consideration in the past it will be well to do some solid thinking and on planning rotations that can be put in working order at the commencement of the growing season of 1911.

THE CITY MAN AND THE FARMER.

This is the season of the year when the city man, who has any love of nature left in him, frequently wonders what he is living for anyway. He gets up in the morning and sees the warm haze lie on the distant hill, or, perhaps only the sunshine flooding the tree tops on his shaded street ; and he thinks of the broad fields far away bathed in this vivid radience, up and down whose new turned furrows go the farmer in the fresh spring morning. But there is none of this for the business man in a big city. He climbs wearily into a clanging trolly car and goes away to his daily imprisonment in an office full of stale air. He may open the window; but it is the dust and din of the streets that come in. Then what is there to show for the work of his hands or head ? A farmer ads visibly and undeniably to the wealth of the world. He plants his seed ; and in the autumn he will reap his harvest—golden wheat for the threshing, vegetables for the bins, red and yellow fruit for the cellar. He produces something which he can sell to his fellow men with the consciousness that he is giving vulue for value. But the city man ! Undoubtedly he produces something of value, too, else he could not exchange it as a steady source of livelihood for the yield of the farm. But it does not grow to value under his eyes—he connot handle it with the same certain and definite knowledge of what it is, and what it is good for that the farmer can who plants a young cabbage and plucks a full "head."

EDITORIAL NOTES.

Many a cow is good, just because her owner is good.

Dairying is a business that must be strictly attended to by the ones interested.

How Can Alfalfa Growing Receive a Boost in the Maritime Provinces?

New Brunswick Can and Will Sow Alfalfa.

Sir,—When in New Brunswick last July I ventured some comments upon the outstanding value of alfalfa for which you were good enough to find space in your columns. In the course of these comments I stated my humble opinion than on your reasonably fertile uplands alfalfa would prove an exceedingly profitable crop; and shortly thereafter had the satisfaction of actually seeing my contention demonstrated on the farm of Hiram Secord, Penobsquis. Mr. Secord had two patches of alfalfa which, so far as I could determine, was the Grimm strain, introduced into Minnesota in 1857 by Wendelin Grimm, a German immigrant, and which has proven by far the most successful of all the varieties so far offered. Both of the experimental patches in question were just as thrifty as one could wish; and it was most pleasing to note Mr. Secord's knowledge of the habit and handling of the plant, which knowledge he had apparently shared with his lads. He informed me also that quite a number of other farmers in the district had undertaken similar trial, and that the moving spirit of these trials was a gentleman in the provincial dairy service, whose name I am sorry has at the moment escaped me; but who organized such trials entirely as a private effort, supplying the seed at his own expense. It will scarcely be denied that this quiet, sincere striver after better things merits not merely ordinary recognition and encouragement, such men instinctively avoid the limelight. Nevertheless, they are a priceless asset.

The main object of this communication is to tell you that this year again my alfalfa has wintered beautifully. It has now passed through four winters. It is the Grimm variety. The recent winter was very severe, more particularly as its earlier portion was devoid of snow. Now, here is the point: If alfalfa can be wintered here, what is to hinder its successful handling in New Brunswick where conditions are so very much more favorable? I am more than ever convinced that ere very long alfalfa will have solved our fodder problem, and, might, I add the extra conviction that before the passing of many years there will be ample acres of alfalfa on the land of every intelligent farmer in your magnificient provinces.

Some idea of the value of the legume in question may be gathered from tne report of the New Jersey Experiment Station, which gives the average yield of green clover at 14,000 pounds per acre, while the average yield per acre of green alfalfa was 35,500 pounds. The protein per ton clover is given at 246 pounds, while the same quantity of alfalfa equalled 265 pounds protein. This means than an acre of alfalfa contains 2,214 pounds protein while an acre of clover contains only 616 lbs. protein. Of course, at the station in question, alfalfa was cut two or three times annually, which largely accounts for the heavy yield. But it is yield and fodder value that the farmer wants; and he certainly gets them in alfalfa. Further, alfalfa helps the lands considerably more than clover, and alfalfa will last without reseeding for from ten to 100 years.

I trust thay my success, under conditions infinitely more adverse than yours, may be encouraging to my New Brunswick friends. Alfalfa can absolutely be grown to great advantage with you. Let those who doubt pay a visit to Mr. Secord's beautiful farm at Penobsquis. In addition to seeing a really good stand of alfalfa, they will also see what progressive, intelligent and energetic agricultural methods may accomplish on land which is by no means the best.

I shall have 600 and perhaps 900 acres in crop this season—900 if possible.—F. MacLure Sclanders, Saskatoon, Sask., in a recent issue of The Telegraph, St. John, N. B.

Editor's Note.—The gentleman referred to by Mr. Sclanders as having done so much for Alfalfa growing in New Brunswick is Mr. C. W. McDougall, Dairy Superintendent, Sussex, N. B.

$1,000 For Alfalfa Growing

The Maritime Farmer is seriously considering the offering of $1,000 in futurity prizes for Alfalfa fields in the Maritime Provinces and Newfoundland to be judged in 1916 or 1917. The idea is to conduct the competition for these prizes along the lines followed by the Saskatchewan Department of Agriculture as published in our issue of March 21st.

Before embarking in this undertaking we would like to know whether **YOU** will enter the competition or not. It is essential that we know to what extent our various Alfalfa enthusiasts will interest themselves and others.

We want some suggestions from **YOU**. How large a plot would you suggest? How many winters should the plot survive and thrive before the prizes are awarded? What division of the prize mcney would you suggest? What do you think of the scheme anyway? Any suggestions will be appreciated.

The Alfalfa Crop.

Every farmer should make an effort to find out whether or not his farm cannot be made produce Alfalfa successfully.

Scientific agricultural research has resulted in many important discoveries of truths, which when applied have proven of inestimable value to agriculture. Perhaps there has been no one discovery made of greater import or practical value and application than the scientific knowledge gained concerning this greatest of farm crops, viz., alfalfa. Although this crop is one of our oldest of farm crops, as we find mention made of it in ancient history as having been cultivated by the Greeks, Romans and Egyptians before the Christian Era, long before we find anything concerning our other farm crops, still strange as it may seem not until very recently has the plant been studied and accurate scientific knowledge gained, that reveals its great worth to agriculture and sets forth its scientific relation to the soil, bacteria and plants, and its requirements of growth, which knowledge has made it possible to grow the crop over large areas of Europe and America.

There is no one crop today that is so engaging the attention of live agriculturists and it is merely the knowledge to hand today that enables us to grow the crop so successfully, and the dissemination of this seems to be the effort of our agricultural press at present. Still there are many who have not taken up the growing of the crop, and while the propaganda is being vigorously waged, there are many who will let the opportunity of seeding a small area (if only by way of experiment) this present season go by, the alfalfa crop remaining untried. While we have in Ontario already many very successful growers of alfalfa, we have a majority who entertain very hazy ideas concerning the crop, they are still uncertain, remembering well the few failures they have learned about and so refrain from giving it a try themselves; although believing it to be a very valuable crop when once established on a farm, and in this class we have a god many in eastern Ontario.

I think I may say that there is no section in Canada where this crop would prove of greater worth than to we dairy farmers of eastern Ontario. We are farming rather intensively; we demand a large yield from our soils. Alfalfa gives this and makes the soil grow more of a succeeding crop than it ever grew before. Our stock require in the large production of milk and butter fat desired; largely nitrogenous food, of the best quality, nutritious and palatable, not only in winter dairying and feeding is this essential, but in summer as well the same aplies, and in this instance as green feed or the soiling crop, nothing fills the bill better than alfalfa. Briefly stating it, alfalfa is the richest in feeding value, in the one element we are always striving to supply and that costs most to buy in our feed stuffs, viz., nitrogen or protein, of any field crop yet introduced, while as a growing plant it gathers and stores in the soil the greatest amount of that one element of fertility, nitrogen and improves to the greatest extent the physical condition of the soil by adding humus from the residue of the crop, and lessening the sub-soil by the action of its deep feeding top roots than any other field crop grown today.

Aside from the high feeding value of alfalfa, the crop would be one of our best considering the large yield realized, as three and not infrequently four cuttings are cut each season, making a yield of from seven to eight tons per acre in many instances, while a stand that is worth leaving should produce at least five tons per acre on the average. We have briefly explained its beneficial effect on the soil, it is the greatest soil improver of all; and in many instances has reclaimed soils that could not be made produce other crops successfully.

In discussing its feeding value, it may be mentioned in pasing that in the western American States where alfalfa is grown quite extensively, many mills are established where the dried hay is ground into fine meal and this product sells readily for almost as much as wheat bran. If the feeding value of this crop so nearly approaches bran as to be worth nearly as much per lb. on the market in competition with other feeds, at three cuttings per season and a yield of five tons or more per acre, is it not a cheap source of this rather expensive concentrate, bran, and would it not be an excellent feed to supply our dairy cattle, and growing young stock, and our working horses and colts? The feed bill today where dairy cattle is properly kept is very considerable, yet we have among our most successful Ontario dairy farmers those who are following most successfully winter dairying without the use of any wheat whatever, relying solely on alfalfa hay, roots and silage. This being true (and in view of the enormous prices of concentrates at present) should be sufficient to make us sit uu and take notice, and awaken an endeavor on our part to find out what there really is in this alfalfa crop for us.

Taking the chemical analysis of alfalfa, we find it a medium between wheat bran, which it very nearly approaches, and best quality of red clover.

According to Prof. Henry's findings in his work on "Feeds and Feeding," the chemical analysis of bran and alfalfa reveals the following:

Bran—moisture, 11.5; ash, 5.4; protein, 16.1; crude fibre, 8.1; carbohydrates, 53.7; ether extract, 4.0.

Alfalfa—moisture, 9.4 ash, 7.4; protein, 14.3; crude fibre, 25.0; carbohydrates, 42.7; ether extract, 2.2.

In this analysis we note the protein content of both feeds is very high, particularly the bran, the nutritive ratio in either case being rather narrower than it is generally conceded to be.

To make another comparison, one ton of bran costs approximately twenty-one dollars. Allowing liberal estimates for rent of land, manure, seed and labor invo,ved in growing alfalfa, the same amount of feed value is produced by alfalfa, making no allowance for the improvement of our soil through growing the crop, at a cost of four dollars. We may add the moral is surely obvious.—C. HAMILTON, in Ottawa Valley Journal.

Always Sign Your Name.

We frequently receive unsigned communications from some of our subscribers. Not unfrequently these communications are accompanied by cash or money orders, which we are unable to place to the credit of the remitters, as we do not know who they are. We have a postal note in our office now, dated Woodstock, N. B., March 18th, 1911, which was sent us unsigned.

The following letter from Prof. M. Cumming, Truro, N. S., also reveals a similar conditicn existing among some of the farmers who correspond with the College Authorities:

Truro, Nova Scotia, May 1, 1911.

Editor "The Maritime Farmer,"
Sussex, N. B.

Dear Sirs:—Last week a letter arrived at the College, addressed to Mr. E. S. Archibald, requesting a bottle of nitro culture for alfalfa and enclosing .25c for same. The writer took the opportunity to write a report on the excellent resufts which he had with red clover the previous year, but he failed to sign his name.

Possibly you can put a note to this effect in your paper and it might reach his eye.

Yours Sincerely,
M. CUMMING.

A Comparison in Clovers.

I have heard and have read a lot about alfalfa and of its value as a field crop but there are a few other important points I wish information on before sowing some myself. I have a piece of land that I had in corn and roots last year. The soil was liberally manured about a year ago. Would this be suitable for growing alfalfa? The land is a clay loam. Will you kindly answer the following questions:

(1) Is alfalfa superior to the common red clover as a feed?

(2) Is the yield greater per acre than other clovers?

(3) Is alfalfa growing a greater strain on land fertility than other clovers or as timothy?

(4) Is a good stand of alfalfa, left for four seasons, better for the laod than other clovers?

(5) How many crops can be taken from an alfalfa field in one year and how many years can a good stand in such a field be kept before clover will die out?

(6) Is alfalfa better as a crop to choke out weeds than common clover?

(8) A number of my neighbors are also thinking of trying alfalfa this year as well as myself and a great deal depends on your answer as to whether we will try it or not. It is not being grown in this district anywhere, to my knowledge.—C. W., Hilliardton, New Ontario.

Answer: (1) The following table gives the comparative amounts of digestible constituents in one ton of hay or each of the two crops:

Constituents.	Alfalfa	Red Clover.
Protein	192.2 lbs.	141.0 lbs.
Fat	30.0 lbs.	29.4 lbs.
Nitrogen free extract	496.6 lbs.	587.4 lbs
Fibre	203.5 lbs.	209.4 lbs.

These figures are quite suggestive and are worthy of chreful study.

(2) Yield per acre—Alfalfa as soiling crop will yield from 20 to 30 tons of green feed per acre in the same season.

Common Red Clover as a soiling crop will yield 15 to 20 tons of green feed in the same season.

Cured as hay alfalfa will yield from 5 to 7 tons in three cuttings. Common Red will yield 3 to 4½ tons in two cuttings of the same season.

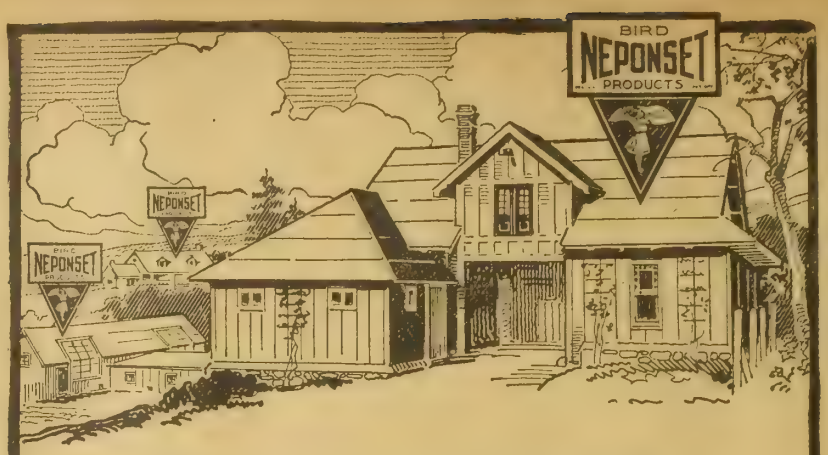
(3) Alfalfa being such an exceedingly deep rooted plant is one of the easiest feeders on the soil. Common red clover also has a deep rapid root growth which reaches down into the lower soils where other crops cannot reach, bringing fertilizing elements to the surface making both plants soil enrichers. Alfalfa is not considered equal to medium red clover as a direct means of fertilizing and in otherwise improving the land on which it grows. This does not arise from the less power on the part of alfalfa to draw nitrogen from the air and deposit it in the soil but rather from the fact that the red clover establishes itself more quickly and is more frequently grown in the rotation. Farmers should now allow alfalfa to remain down on the same land too long. Allow some other part of the farm to have the benefits of the fertilizing and mechanical power of its root growth. When alfalfa is all fed upon the farm on which it is grown it then becomes a source of fertilization scarcely without a rival among plants grown upon the farm.

(4) Take for instance a four-years' growth of alfalfa. If it was a good stand it would be the superior as a fertilizer. The fertilizing elements of common red is at its best after the first season's harvest. After the second season the value deteriorates. The common red can however be sown twice in the four years and would be equal if not a little better than the one year's growth of alfalfa. Alsike and White Dutch clover cannot be compared with the root growth or the value to the soil with alfalfa. The mechanical effects upon the land are very beneficient. It improves the tilth by means of the thick root growth.

(5) The number of cuttings will to some extent depend on the season. When cut as a soiling crop five or six cuttings can be taken off. When cut for hay three cuttings may be harvested. It is best in all cases to cut and feed alfalfa off the field as live stock is liable to crop the plants too close which is the cause of may failures. In no case should alfalfa be cut or pastured too late in the autumn. It is best to leave a growth of 12 to 18 inches to protect the plants over winter. When alfalfa is sown on a perfectly clean field and a perfect stand secured it will last 6 to 8 years and sometimes longer although this is not desirable.

(6) Alfalfa, possessing a sing,e stem when the plants are young and a tap root, would not as a weed destroyer be equal to the common red. Both clovers are however great weed destroyers because of the number of cuttings each season. Clovers are cut so frequently as to make it practically impossible for most forms of annual weed life to mature seed in the crop. The same is true of biennials and also perennials, but there are some forms of perennial weeds which multiply through their root stocks that eventually crowd alfalfa. Common red clover is usually cut twice a year. In it annuals and biennials cannot mature seed except in exceptional instances. To accomplish such an end the seed must be sown thick and the plants must be both vigorous and numerous.

(7) If alfalfa is to be used as a soiling crop cutting may begin any time when the alfalfa has grown 12 to 18 inches high or just as the buds are appearing. In cutting for hay the best time to harvest alfalfa for hay is just after the blossoms begin to appear or when about 1-3 of the blossoms are out the harvesting should begin. If cut earlier the loss of weight in the crop will be considerable as it will be soft and immature. If cut after the stems become over-woody and the loss of leaves in curing will be much greater. When large areas of alfalfa are to be harvested the importance of beginning early cannot be over-estimated. It is much better to cut early and lose something in weight of the first cutting than to meet with greater loss in weight in the next crop or crops. Mowing should begin as soon as the dew is off in the morning. The tedder should follow. Get the hay slightly wilted then it may be raked in windrows and put up in small coils the same evening. After the hay has become wilted it shhuld not be stirred or handled any more than is really necessary before being housed.—Central Canada Citizen.



Shingles Crack and Split

When you think of the good old shingled roofs that seemed never to wear out, don't forget that the shingles of today are not the shingles of twenty-five years ago. Modern kiln-drying methods destroy the wood fibre, causing the shingles to crack and split.

NEPONSET
Paroid Roofing

is made to last. Back of NEPONSET Paroid Roofing is over a century's experience in one line of manufacture. Every roll is guaranteed.

There are different NEPONSET Roofings for different types of buildings. Let us know whether you are building or repairing a residence, barn or poultry house, and we will give you full particulars about the NEPONSET Roofing that is giving satisfactory service on a building near you of just that type.

NEPONSET Dealers everywhere. If you do not know the one in your locality, write us.

Alfalfa for Sandy Soil.

J. F., Westmorland Co., N. B.—I attempted to grow Alfalfa when I first heard of it, perhaps a quarter of a century ago, and I failed. Now I am constrained, at least, in part, by the recent discussion in the "Farmer" to make another attempt. The ground I want to grow it on is sandy, gradually growing more purely sand and harder until at a depth of six (6) feet it is shelly sandstone. The surface is rich by reason of frequent applications of barnyard manure and very free of weeds.

Will such land produce good crops of clover?

I want to grow potatoes on a very sandy field in 1912. Can I cultivate this year so as to conserve moisture for the crop of 1912, or how can I handle the field before the potatoes are planted to conserve moisture for that crop?

Ans.—If the soil referred to is made rich by the application of barnyard manure and nitro culture is used if needed, we see no reason why clover and alfalfa would not do well on it. Your best and most accurate reply to this question would be that given you by the result of trial plots conducted under careful and favorable conditions.

The addition of vegetable matter to sandy soils is very important, since it is needed to increase their holding capacity as well as to add fertility. Water is often the limiting factor in the production of sandy soils, due to their coarse texture and lack of vegetable matter. The fertility needs of sandy soils are nitrogen, phosphorus and potash. Phosphorus and potassium must be supplied either directly in commercial fertilizer or indirectly through the buying of feed which is fed to animals. The average sandy soil contains only one-third to one-half as much fertility as clay loams. Legumes are beneficial to sandy soils, because they supply the much needed nitrogen as well as humus. Peat can be used to advantage as a nitrogen fertilizer where a supply is readily available. The use of lime on sandy soils, which are very commonly acid, will aid in securing a stand of alfalfa and clovers. Inoculation is also usually necessary to grow good crops of legumes. Rotations for sandy soils must be chosen so as to increase the amount of vegetable matter and provide a legume crop to cover the soil at least one in every three years. Growing and plowing under some green crop this summer will add to the humus and water holding capacity of your field for a 1912 potato crop.

Some Alfalfa Queries.

Enclosed please fine postal note for 80 cts. for paid up subscription to Maritime Farmer to April 1912.

I am thinking of trying a small plot of Alfalfa and would like to know how seed is treated with nitro culture? How much seed will a twenty-five cent bottle go over? Would it be any harm to use the same on half amount of seed?

As to what I think about our provincial governments being asked to give money to be expended in prizes for competition, I would not be in favor of it at all because we do not have it established well enough for that, and I think we will have to begin on a small scale. If they can be induced to give us any money, let it be used for demonstration plots in each vicinity to show us how to grow it.

Do any of the Farmers' and Dairymen's Associations or Agricultural Societies of N. B. publish an annual report. I would like to have a copy.—Harry McMackin, Kings Co., N. B.

Ans.—Directions for applying Nitro Culture to seed go with each bottle. One twenty-five cent bottle of Nitro Culture contains sufficient culture to inoculate one bushel of seed, or it might all be applied to any smal, quantity with beneficial results. The New Brunswick Department for Agriculture issues a yearly report which usually contains an account of the doings at the various farmers' meetings held in the province. A free copy may be secured by writing for one to W. W. Hubbard, Secretary for Agriculture, Fredericton, N. B.

Handling Soil for Alfalfa.

I prepared land for alfalfa last year and got some seed at the state college. Through a delay of express company seed came too late to sow. I put on a ton of lime and seeded to rye last fall. How should it be handled this year and will seed be good.— D. Eddy, Massachusetts.

The probability is that the seed furnished him last year, which we believe to have been of unusually fine quality, will germinate this year nearly as well as last. I advise turning the rye under when in bloom, applying the basic slag meal and potash as was advised last year (if this was not done at that time), harrowing repeatedly until about the last of July in order (1) to somewhat consolidate the soil, and (2) to kill any annual weeds which may start. I should sow the alfalfa when the moisture conditions are such as to favor quick germination, some time between July 25 and August5. But just before sowing the seed I would apply fertilizers as recommended last year. As the best means of making clear to readers what was recommended last year I give outline directions, which were furnished to all experimenters.

WHAT METHOD TO FOLLOW.

Select a small piece of land, one-fourth acre or more, which is naturally thoroughly underdrained. The surface also should slope gradually, as standing water or ice will soon kill out the alfalfa. A moderately heavy soil is probably the best, but you will have to use whatever soil you have on your farm, provided it meets the requirements as to drainage. It would be well to select a piece which was plowed last fall, but if this is impossible, plow now as soon as possible.

To the rough furrow apply about 1½ tons lime per acre. If you do not have a supply of agricultural lime on hand, I would get sufficient building lime by the barrel for this small piece and spread it in piles on the plowed surface and add water enough to slake it until it changes to a fine, dry powder, then spread evenly and harrow in deeply with wheel harrow. Keep the piece harrowed at intervals of about two weeks to destroy weeds and about June 20 apply per acre: Basic slag meal, 1200 pounds; high-grade sulphate of potash, 350 lbs. If you cannot get these materials apply about one ton per acre of some ready mixed fertilizer rich in acid phosphate and potash. Harrow the fertilizer in well and keep harrowed at intervals until seeding time.

Just before seeding time apply per acre the following fertilizers: Nitrate of soda, 125 pounds; basic slag meal 300 pounds. If you cannot get these materials, apuly 400 to 500 pounds of a ready mixed fertilizer rich in nitrogen. Harrow well until you have a good seed bed. After sowing the seed, it should be scratched in lightly with a weeder or similar tool and rolled. What growth the alfalfa makes this season should be left uncut as a mulch for protection next winter, as alfalfa sometimes badly winterkills.—Prof. Brooks of Mass. Agricultural College.

Alfalfa for Horses.

In the Yellowstone valley alfalfa is about the only hay or forage farm horses are fed, and most of our farmers and many city people feed it the year round. Our horses do better on alfalfa and take less grain than when fed on timothy or blue stem hay. When not at heavy work they do very well on alfalfa alone. Numbers of city horses kept for family use are fed alfalfa alone, but for heavy driving should have some grain.

The only trouble in feeding it is that most men feed too much. Stock like it and will eat more than they need and in that case will be soft and short winded. In many sections they recommend feeding first cutting to horses or letting it get over-ripe. In that case they feed 30 to 40 lbs. hay and the horse is only able to eat about half of it, because it is too coarse, but he gets about the amount he should have. We believe in giving the horse choice, fine alfalfa hay and have him clean it up. It is cheaper and better for the horse. —I. D. O'Donnell, Yellowstone Co., Mont.

A CURE WITHOUT DRUGS

Wear My Belt Until Cured and Pay Me When the Work is Done

I have the grandest invention of the age for weak, rundown, wornout men; the surest and easiest cure for all nervous and chronic diseases. Its wonderful power is directed to the seat of the nervous system through which its vitalized strength penetrates into all parts of the body, carrying new life to every function which has been weakened by disease or dissipation, restoring energy to the brain and power to the system. No weak man will ever regret a fair trial of this invigorator.

Why will you be weak? Why do you go on from day to day when you know you are losing your nerve force—your manhood—when you see a cure within your grasp? Do not delay a matter which is the key to your future happiness. Whatever your condition to-day, you will not improve as you grow older. Age calls for greater vital force, and the older you get the more pronounced will be your weakness.

I want you—if that means you—to come to me, and if I say that I can cure you I don't ask you to pay me until I DO SO, if you give me reasonable security for the Belt while you use it. That is fair, surely. You take no chances, as I know what I can do, and I'll run the risk.

All men cannot be MILLIONAIRES, but thousands of them could be much better off FINANCIALLY, SOCIALLY, and in every other respect if they would guard their HEALTH. With VIGOROUS HEALTH—a body full of ELECTRIC ENERGY—a man can make OPPORTUNITIES if he don't find them, but, lacking in the COURAGE, and SELF-ASSURANCE that is born of MANLY VIGOR, he is but a derelict—a vessel without mast or rudder—cast hither and thither by every storm of life that besets his pathway. GIVE ME A MAN that has exhausted his VITALITY—suffering from PAINS AND ACHES — MENTAL DEPRESSION — SLEEPLESSNESS — NERVOUS DEBILITY — WITHOUT HOPE — AMBITION —COURAGE gone—drifting with the tide — and I can transform him into a STRONG MAN—a man of push—a man that will make his way in spite of all obstacles—if he has anything left to build upon, if he will follow my advice and use the DR. McLAUGHLIN ELECTRIC BELT as I direct. Save your tobacco money for a few weeks—cut out a few of your health-destroying, soul-destroying habits—procure on of these appliances—USE ELECTRICITY, and use it in the right way to invigorate your body, and you will look upon the day you gave your case to me as the TURNING POINT of your life.

Mr. Alex. Marr, Russell, Ont., says: "Anyone who is skeptical about your Belt, tell them to write to me. I feel like a new man."

Dear Sir,—I am able to say that I believe I am completely cured of Rheumatism. I have not felt a sign of it for two months, and I can recommend your Belt to any sufferer of Rheumatism.—Fred Lemon, Bognor, Ont.

Dear Sir,—I am pleased to report a good account as regards my health. I am beginning to find myself stronger in every way. Certainly your Belt does its duty and its work is sure. — William P. Morter, Box 87, Hawkesbury, Ont.

Dear Sir,—I wish to say that your Belt has done me more good than all the medicine I ever took. I used it every night for about three months, and since then I do not need it. I can sleep good, and feel as good as ever I did. I am only too pleased that I made up my mind to get your Belt. You have my permission to use this letter if you wish, as I will be only too pleased if it will help anyone to get a cure.—Yours sincerely, John Hunt, Davisville, Ont.

Dear Sir, — Received your letter of the 4th inst., and in reply I can say that your Belt gave entire satisfaction. With best wishes, I am, Sir, yours very truly, Ernest Ryerse, 106 Queen St., St. John, N.B.

Cultivate cheerfulness. It pays Energy and cheerfulness — that's a combination that can't be beat. Feed your system with this great Invigorator—Electricity. Apply it with my Belt—the only correct system, and it will overcome your weakness, your pains, your aches. Animal vitality, that's what you lack. If you want to feel strength and energy in every part of your system; if you want to feel the life-blood dancing through your veins; if you want to make your mark in the world, build up your vitality with my Belt, and you can be a Man among Men.

FREE TO YOU

Call at my office, or mail this coupon with your address, and I will send you my beautifully illustrated 80-page book, full of good news to weak men, and free for the asking.

THE ESTABLISHMENT OF APPLE ORCHARDS

Part 3—Insect and Fungus Enemies.

By A. G. Turney, Horticulturist.

SPRAYING ESSENTIAL.

There are still fruit growers who profess to believe that just sunshine and rain are enough to produce the best fruit—that nature is all-sufficient. Is there anything that grows that cannot be improved with care and attention, and isn't it true that in all nature the same inscrutable source which nourishes the plant provides also the pest to destroy it? Spraying is absolutely essential to successful fruit growing. The man who raises the fine healthy crop year in and year out is the one most ready to acknowledge this fact and it is the man who raises the poor fruit who is the most active in finding excuses, in blaming the soil, the weather, etc.,—everything but his lack of proper attention to the trees. Go into your orchard and examine the trees. Don't you know that the moss sucks the sap out of the trees, and closes the pores of the bark? Notice the cracks in the bark— the rough appearance, the scale and the lichens! Is it any wonder that your trees become stunted and unhealthy and your fruit is undersized and worm-eaten? It is a question of how long trees will stand such treatment even on the finest soil. You may depend upon it that larger, cleaner fruit, and more of it, always come from the healthy trees with clean, smooth bark, free from moss, scale, and lichens. Destroy the insects and fungi, and it will add fully one-third to the producing capacity of your trees, and over fifty per cent. to the market value of your fruit. There is just one way to do it—and the only way—spray.

CLASSIFICATIONS

The most important insect enemies of the apple may be classified as follows:—Those devouring the foliage; those boring in the wood; those occuring on the bark; and those attacking the fruit.

Insects may be separated into two general classes by the nature of their mouth parts, and a knowledge of this point is essential to the intelligent and effective use of remedies. With the one class those insect which have biting mouth parts with which they procure their food, such as caterpillars, it is only necessary to coat the foliage and fruit with some poisonous material which being swallowed with the food will cause death. In the other class the insects which suck up their food in liquid form through a beak or hollow tube such as plant lice and oyster shell scale, stomach poisons are abviously of no use and these insects must be killed by some contact remedy such as kerosene emulsion which causes death by clogging up the breathing organs of the insect, resulting in suffocating. For such insects as borers which cannot be reached by surface applications, the measures taken must be largely preventive and consist in applying strong smelling washes distastful to the female adults and in consequence on which they will not lay their eggs.

SPRAYING MIXTURES

Bordeaux mixture is still the standard and most commonly used fungicide, but the commercial lime and sulphur solutions are rapidly coming into greater use and promise to replace it. They are easier and cleaner applied, needing only dilution with water; they are almost if not quite as effective a fungicide; and their use does not result in the russetting of the fruit, which is sometimes a serious disadvantage to the use of Bordeaux. The commercial lime and sulphur sells at from $8.00 to $9.00 per forty gallons of solution testing 32 degrees. This strength should be diluted about 1 to 9 for a winter spray and about 1 to 40 for a spring and summer spray to replace Bordeaux in sprays Nos. 1,2 and 3. Where this is done it is not advisable to use Paris Green for the poison. only Arsenate of lead. The addition of five pounds of freshly slacked lime will make the solution show up better on the foliage and enable the operator to ascertain if the work is being properly done. After this addition of lime the mixture should be immediately applied or a certain amount of crystalization may take place.

POISONED BORDEAUX MIXTURE.

Blue Vitrol ....4 lbs.
Lime (fresh) ....5 lbs.
Water .... 40 gallons
Arsenate of Lead ..... 2 to 3 lbs.

Dissolve the copper sulphate by suspending it inside a wooden or earthen vessel containing about 5 gallons of water. Slake the lime in another vessel. If the lime when slaked, is lumpy or granular, it should be strained through coarse sacking or a fine sieve. Pour the copper sulphate solution into the barrel, or it may be dissolved in this in the first place; half fill the barrel with water, agitate with water and agitate thoroughly. A stock solution of copper sulphate and milk of lime may be prepared and kept in seperate covered barrels throughout the spraying season. The quantities of copper and sulphate, lime and water should be carefully noted. If Paris Green is used eight ounces to 40 gallons is sufficient. Arsenate of lead is a safer and more reliable insect poison than Paris Green, as it is uniform in composition, is less apt to be adulterated, stays in suspension longer and is thus better distributed over the tree, remains on the foliage longer and does not cause injury by burning. The relative cost of these two insecticides per one barrel of spray mixture is approximately as follows:

Paris Green, 8 ounces at 30 cts. per lb., 15 cts.

Arsenate of Lead, 2 to 3 lbs. @ 12½ cts., 25 to 40 cts.

By purchasing arsenate of lead in 50 and 100 lb. packages it can be got lor 12½ cts. or so per lb. Whereas the cost per barrel of spray mixture is apparently twice as much as for Paris Green, in reality it is the cheaper insecticide on account of its greater efficiency and reliability. Before incorporating either the Paris Green or Arsenate of Lead in the spray mixture, make into a thin paste with water.

POISONED LIME SULPHUR.

Commercial Lime and Sulphur 1 gallon.
Arsenate of Lead, 2-3 lbs. mixed with water, 1 gallon.
Water 38 gallons.

Do not use Paris Green with Lime Sulphur.

FOR BORERS.

Soft soap reduced to the consistency of thick paint by the addition of a strong solution of washing soda water. If applied with a brush early in June, during the morning of a warm day, this will dry in a few hours and form a tenacious coating not easily dissolved by rain.

WHEN TO SPRAY, WHAT WITH AND WHAT FOR.

WINTER APPLICATION.

For old orchards that have never been sprayed, and for young orchards badly infested with Oyster Shell Bark Louse, spray before the growth starts with lime, 30 lbs. lye, 1 lb. of water 40 gallons or Commercial Lime Sulphur 1 to 9 diluted. This spray may be applied any time during the dormant season of the trees. Slack the lime gradually, make up to the required amount with water and add the lye. Strain the mixture through a fine mesh before using. This mixture acts as a general cleaning spray for old trees. Reduce the amount of lye one half on young trees.

APPLICATION NO. 1.

Poisoned Bordeaux Mixture or poisoned lime and sulphur, when the leaf buds are swelling in the spring. For tent caterpillars, bud moths and cigar case bearers.

APPLICATION NO. 2.

Same mixture as above made just before blossoms open and just after the cluster buds unfold. This is the first application for the scab and protects the young leaves and stems of the forming fruit. The poison is added for leaf eating insects.

APPLICATION NO. 3.

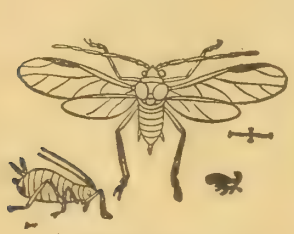
The same as abone, applied when most of the blossoms have fallen and the little apples are still standing upright. Do not wait until the little apples hve turned downwards as it is then too late. This is the first application for coddling moth and is important in fighting the scab as it is this application which gives clean fruit.

APPLICATION NO. 4.

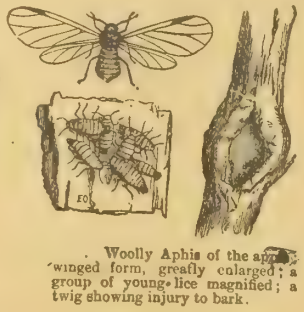
Arsenate of lead 2-3 lbs. and water 40 gallons a week to ten days later. If judged necessary, lime and sulphur may be used instead of water.

SPECIAL SPRAYING MIXTURES.
KEROSENE EMULSION.

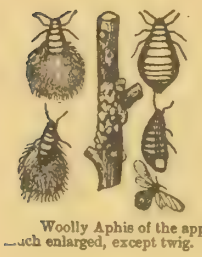
For green and black aphis and as a summer spray for oyster shell scale, apply as soon as the pests are noticed at work on the trees. In spraying for aphis use elbow attachment permitting the thorough spraying of the under surface of the foliage



Winged and wingless Aphis—greatly enlarged.



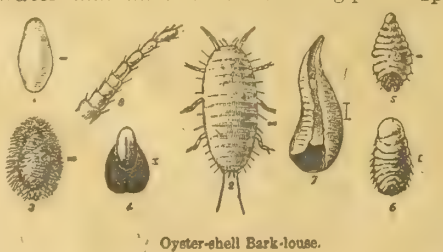
Woolly Aphis of the apple; winged form, greatly enlarged; a group of young lice magnified; a twig showing injury to bark.



Woolly Aphis of the apple; much enlarged, except twig.

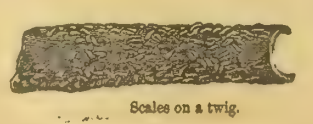
Apple-root Aphis; *a* distortions on a root; *b*, wooly wingless form; *c*, winged Aphis—greatly enlarged.

The Scurfy Bark-louse.

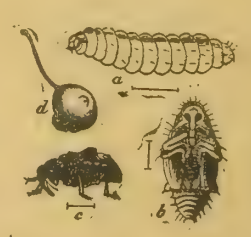


Oyster-shell Bark-louse.

A Scale, greatly enlarged.



Scales on a twig.



—Plum curculio: *a* larva, *b* pupa, beetle, *d* young fruit attacked.

Plum curculio attacking young fruit.

FORMULA FOR PREPARATION OF KEROSENE EMULSION.

Kerosene, coal oil, 2 gallons.

Rain water, free from dirt particles, 1 gallon.

Soap, ½ lb.

Dissolve the soap in the full amount of water and when this solution is boiling hot remove from the fire and add the kerosene. Stir the mixture violently by driving it through a force pump back into the that will not separatef This requires usually from five to ten minvessel until it becomes a creamy mass utes. For use, dilute one part of the emulsion with 8 to 10 parts of water for scale insects and hard-bodied insects like the clinch bug. For soft-bodied insects such as plant lice, lice on animals, etc., use one part emulsion to 15 or 20 parts of water. The stock emulsion will keep good for months if kept in air-tight vessels.

Kerosene emulsion kills by contact, and therefore the application should be very thorough. It may be used against a great many different pests, especially valuable for destroying those with mouth-parts for they cannot be killed with arsenical poisons.

CAUTION—Only the dilute emulsion, 1 part emulsion to 15 or 20 of water, should be used when the trees are in leaf, and in all cases it should be kept thoroughly stirred; also apply only on bright, sunshiny days, otherwise the foliage or even the twigs will be injured.

ARSENICAL SPRAYS.

For leaf eating pests such as tent caterpillars, tussock-moths, spring canker worms, etc., which may cause considerable damage after the regular sprayings have been applied, either Paris Green or Arsenate of Lead may be used as follows:—

PARIS GREEN.

Paris Green ....8 ounces
Lime ....3 pounds.
Water ....40 gallons.

Where Paris Green is used without the Bordeaux mixture three pounds of freshly slacked lime is added to prevent burning of the foliage. Make the Paris Green into a thin paste before adding. Keep the poison well in suspension by thorough stirring.

ARSENATE OF LEAD.

Arsenate of Lead ... .2-3 lbs.
Water ....40 gallons.

If the commercially made Arsenate of Lead is not procurable, or if it is desired to make it yourself, use the following formula:—

Arsenate of Soda ....4 ounces.
Acetate of Lead ....11 ounces.
Water ....5 gallons.

Dissolve the ingredients separately in from one-half to one gallon of warm water; mix together thoroughly and add one-half of the mixture to 40 gallons of water. Add milk of lime from two pounds of freshly slacked stone lime. By making arsenate of lead yourself, the cost is no more than that for Paris Green, wholesale for about nine and seven cents per pound respectively.

THE MORE IMPORTANT INSECT ENEMIES OF THE APPLE TREE—DEVOURING THE FOLIAGE.

The Eye-Spotted Bud Moth (Tmetocera ocellena.) The caterpillar when full grown about the third week in June, is half an inch long, dark brown with a black head and collar. Destroys leaf and blossom buds when they are in folding, tying the flowers and leaves together and working from the inside; it also sometimes causes injury by boring down the centre of twigs. Appliration No. 1.

The Cigar Case Bearer (Coleophora Fletcherella) and the Pistol Case Bearer (Cmalivorella) tiny yellow caterpillars which pass the winter in carved cases made from pieces of leaves. In the spring they work on the opening bud eating the tender growth.—Application No. 1.

Leaf Rollers.—Small caterpillars from ¼ to ½ inch long. They fasten together young leaves forming for themselves a shelter in which they feed securely.—Application No. 1.

Tent Caterpillars (Malacosoma Americana and Disstria). The winter is passed in the egg state and the young worms are active with the beginning of growth in the spring. The colonies of the Americana or orchard tent caterpillars live in a whitish tent or web constructed generally in the fork of two branches. In bright warm weather, they leave these tents and feed all over the tree. At night and early morning and in cold damp weather they may be found in the tents. The tents should be removed at such times and burnt or crushed. The colonies of the Forest Tent Caterpillar do not construct tents but mass themselves during dull and rainy weather on the trunks and the main limbs. They may then be easily crushed with an old piece of sack.

TENT CATERPILLARS (*Malacosoma Americana* and *disstria*).

ing or something of that sort. The eggs of both species are laid in July in neat circular masses around young growing shoots. An egg mass will contain 200 or more eggs. These should be removed when pruning. Applications 1 and 2 should completely control these pests as the worms then are very small and easily succumb to a little poison. It is useless however, to wait till they are two-thirds grown before spraying.

The Spring Canker Worm (Paleacnta Vernata) and the Fall Canker Worm (Anisopteryx Pometaria). The eggs of the former are laid in the early spring and those of the latter in the fall and sometimes in the winter, but both hatch out about the time of the leaves folding. The spring Canker Worm is green—the other one brown. The females of both are wingless and crawl up the trunk to lay their eggs in patches on the bark of the limbs. The deposits of eggs may be prevented by banding the tree trunks with tarred paper smeared with tree tanglefoot, or some sticky substance. For the spring canker worm this should be done early in March and for the fall canker worms early in October. Powerful and thorough spraying with an arsenical, while the worms are yet very small will control them. Applications 1 and 2 are made for other purposes; not much trouble need be expected from canker worms.

The Apple Aphis (Aphis Mali) Pass the winter as small shining black eggs on twigs. These hatch into green plant lice early in the spring and attack the new growth of the branches and leaves. Suck the juices from them and check development. They are also to be found in the early fall in clusters on the undersurfaces of the leaves. Spray thoroughly with kerosene emulsion using elbow nozzle attachment to get at the under surface of leaves. Use the high pressure. Winter spray of lime sulphur may partially destroy the eggs.

The Fall Web Worm (Hyphantria textor) Late in the summer webs larger in size and darker in color than those of the tent caterpillar will be found upon fruit and other trees. They contain large colonies of hairy caterpillars which cover the whole of the leaves where they are feeding with a silken web and live within it at all times. These webs are very conspicuous and should be removed immediately by winding them up with a rod as in the case of the tent caterpillars. Large webs on the end of smal, branches are best removed by cutting off the branch just below the web. All webs should be burnt or crushed after removing from the trees.

The Yellow Necked Apple Tree Caterpillar (Datana Ministra) and the Red Humped Apple Tree Caterpillar Aedemasia Concinna. The former is a black and yellow striped caterpillar with a black head and the first segment behind it yellow. The latter has a coral red head and a red hump on the back of the fourth segment and its body is striped with black, yellow and white lines. Both cluster together and will be found completely stripping single branches. They may be crushed or the limbs cut off and burnt. Where high up they may be jarred off with a pole and crushed.

The White Marked Tussock Moth (Hemerocampa Leucostigma) may be controlled by removing and destroying the white frothy covered egg masses, deposited late in the summer. The female moth is wingless. The caterpillars are rather formidable looking things. When full grown they have a shiny coral red head from which extent two stiff horn-like tufts of black hair. A similar tuft is on the other end of the body. Just behind the head are four regular tufts of soft whitish hair and nearer the tail are two small bright red tubercles. The caterpillars emerge about the beginning of June and feed for a month or so. If they become sufficiently troublesome they may be controlled by an arsenical spraying.

The Brown Tail Moth (Eupocrytis Chrysonhereahiim) By Wm. McIntosh, St. John.

The eggs are deposited on the under side of the leaves late in July, these eggs masses usually contain from 200 to 300 eggs each.

The eggs hatch early in August and the young caterpillars feed upon the upper surface of the leaves, a few days only being required to skeletonize them. The little caterpillars soon begin to fasten a number of leaves together with silken threads forming a nest on the ends of the small branches. These nests are so firmly secured to the twigs that they can be removed only with considerable force.

On the approach of cold weather, the caterpillars enter the nests and remain there during the winter. Nearly three hundred caterpillars are sometimes found hibernating in a single winter nest. The caterpillars at this stage are from 1-4 to 1-3 of an inch in length. In the warm days of spring they leave the nest to feed on the buds and young leaves, returning to the nest at night. As they increase in size they feed downward from the tips of the branches, forsaking the nest entirely.

The caterpillars when numerous attack not only buds, leaves and blossoms, but green fruit also, leaving the limbs bare as evidence of their presence.

They are gregarious until nearly full grown when they sometimes disperse to some extent.

The caterpillars are full grown

about the last of June and are from one to one and one-half inches long. The most striking characteristic of the full grown caterpillars are the row of elongate white spots along each side and the two bright red dots or retrartile tubercules on the posterior end of the body. They go into the pupil stage about the end of June The cocoons are frequently formed in

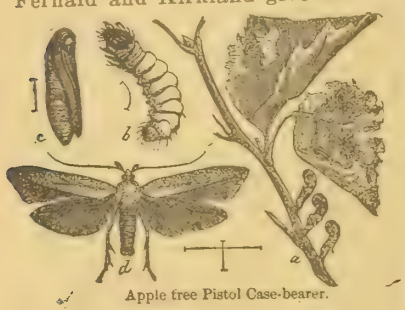
a, b, c

Fig.—Round-headed apple-tree borer: *a* grub, *b* pupa, *c* beetle.

a bunch of leaves at the end of a branch and sometimes in crevices in the bark. Two weeks is the length of the pupal stage and moths emerge about the third week in July. Both sexes are very much alike except that the female is slightly larger, pure white with golden brown hairs on the end of the abdomen giving it the name of the brown tail moth.

The moths are strongly attracted by light.

Fernald and Kirkland give a list of



Apple tree Pistol Case-bearer.

81 species of trees and shrubs upon which the caterpillars feed. Apple and pear appear to be favorites in the infested districts. Maples, elms, oaks and wild cherry are the forest trees most liable to be injured.

The hairs of the caterpillars are easily broken off and when they come in contact with the human skin they cause a rash and intense itching becoming serious in some cases. This itching is so prevalent in the infected districts that druggists keep special lotions for the brown tail itch.

The most effective measure against the insect is the destruction of the caterpillars in the winter nests. These are easily detected during the winter when the foliage is off the trees. They may be clipped off the points of the branches with a long

Eye-spotted Bud-moth and caterpillar.

handled tree pruner. The nests should be gathered and burned; if allowed to remain on the ground the caterpillars may live and in the spring find their way back to the trees.

Poisoned Bordeaux or Lime Sulphur mixture as prepared for other orchard pests is an excellent remedy for the brown tail caterpillars.

Professor Fernald reports experiments in spraying with arsenate of lead in which 1 lb. to 150 gallons of water killed 50 per cent. of the caterpillars in four days; 90 per cent. in seven days, and all in thirteen days. Stronger spraying than this is advisable. Spraying with Paris Green, 1 lb. to 150 gallons, killed 4 per cent in four days; 70 per cent in six days; 30 per cent in nine days; all being dead in twelve days.

ATTACKING THE WOOD.

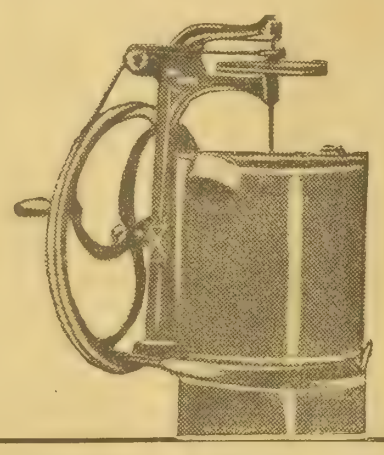
Flat Headed Borer (Chrysobotris Fomorata) Round Headed Borer,

Send The Coupon For Our FREE Book

and by return mail, we will send the complete story of The "Only" Butter Separator. The facts contained in this book

THE "ONLY" WAY

are so revolutionary, that every farmer and dairyman who aims to keep abreast of the times, must read it. It tells the complete story of butter making by aeration—a process that is at once so simple and so perfect, that the only wonder is that it was not discovered long ago. As long as the edition lasts, we will send the book free, although the information in it is really valuable enough to charge for. You had better clip and send us the coupon now—to-day.



THE "Only" Butter Separator, occupying but 22 square inches of floor space, standing 38 inches high and with a capacity of 500 pounds of whole milk per hour, will make butter from sweet, whole milk in five minutes' time. Think of it—

THE BEST GRANULAR BUTTER IN FIVE MINUTES

from sweet milk and leaves skim milk, retaining all the other total solids—an unexcelled feed for stock. You no longer need a cream separator and a churn; you no longer need to make butter by the old, laborious methods of separating the cream, souring it and then churning. With

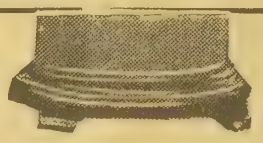
THE "ONLY" BUTTER SEPARATOR

you simply pour in your sweet milk at a temperature of 72 degrees, turn the handle and aeration will produce the finest granular butter in five minutes, or less—free from casein and incapable of turning rancid from the usual cause. Apart from the time saved, figure the cost of this machine at $38.00, against the cost of a churn and cream separator. Then remember that we have no salaried agents and write for our special introductory discount offer to bona fide farmers and dairymen. It will cost you nothing to get this information—nothing but the price of a postage stamp. Write to-day.

The Joshua Brown Co., Limited

Pembroke, - - Ontario.

THROW AWAY YOUR CREAM SEPARATOR AND CHURN.



THE JOSHUA BROWN CO., Ltd., 103 Brown Bldg., Pembroke, Ont.

GENTLEMEN:—Please send me free your book "The 'Only' Way," together with particulars of your guarantee to buy back The "Only" Butter Separator for $50.00 in event of it failing to live up to the claims specified.

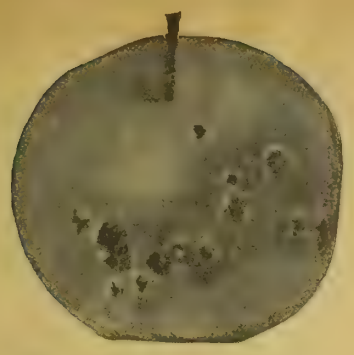
THE LOCK MARITIME WIRE FENCE CAN'T SLIP

The illustration demonstrates the phenomenal gripping-strength of our lock. Under the most unusual strain it never gives. It is known as the lock that can't slip; the lock that unfailingly holds the wires in their correct position.

Our Free Catalogue will tell you more about our can't-slip lock, and about the superior English high-carbon, hard-drawn steel wire from which Maritime Wire Fence is made. Address the card to

New Brunswick Wire Fence Co., Limited, Moncton, New Brunswick



Black Spot on Apple.

(Saperba Candida). These have done much damage to trees and the former is more common than the other. They vary somewhat in habits but the best preventive consists in coating the bark of the trunk and larger limbs with a strong deterrent wash in June. The presence of borers in the wood may generally be ascertained by the boring or sawdust like casting thrust out from the burrows and they may then be cut out with a stout wire or knife.

ATTACKING THE BARK

The Oyster Shell Bark Louse (Mytilaspisulum. Found everywhere throughout the province and inflicts trees and is especially prevalent in a large amount of damage on apple old and neglected orchards. Fortunately it is single brooded. The eggs hatch in June and the active young appear as small yellow specks which soon attach themselves to the bark by inserting the beak into the tissue. The scales then forms and in-

fig. 2½.—Fruit injured by the Apple-Maggot (*Trypeta*).

crease in size. The eggs are laid under the scale in the fall. Remedy—Dormant spray as given before. Where necessary to spray in summer when the young scale are running use kerosene emulsion.

San Jose Scale (Aspidiotus perniciosus! Minute, almost circular scale insects 1-30 inch wide, shape like an inverted saucer with a depressed ring around a central nipple. Not reported in the province as yet, but as there is always a danger of its introduction on nursery stock, etc., the observation of small circular scales about the diameter of a pin head should be immediately reported. Remedy—Spraying in the dormant season early in the spring with lime sulphur 1-9.

The Woolly Aphis (Schuzoneura Canigera) Plant lice covered with a flimsy white material which looks like cotton wool, hence their name. To be found in clusters on limbs and branches especially where there is an exudation of sap from cuts or from wounds. They also attack the roots. For those attacking the branches spray with kerosene emulsion. For those attacking the roots, remove the soil to a slight depth and dig in tobacco dust or apply strong soap washes.

INSECTS ATTACKING THE APPLE.

The Codling Worm (Carpocaspsa pomonella. This insect is very common and the cause of much inferior fruit in New Brunswick, and yet probably not one grower in fifty has ever seen the moth itself, it being very small and flying only at night. The moth lays scale-like eggs on the leaves, stem, or skin of the young apple about the time the trees are in bloom. The larva or small worm is hatched out in a few days and burrows into the fruit usually in the cavity at the calyx end. Later the infested apple falls to the ground, the worm emerges and proceeds to the tree where it forms a cocoon under the bark or other shelter. Practically speaking there is only moths will lay eggs on the fruit in New Brunswick though a few stray

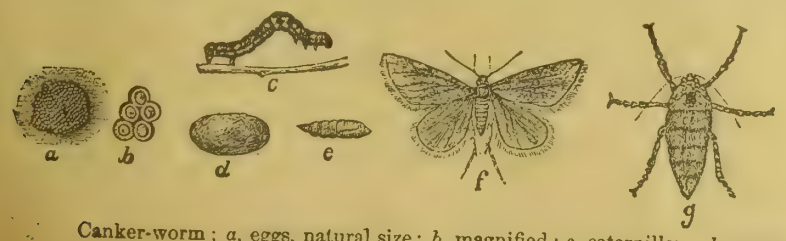
Leaf-roller Moth; wings open.

Leaf-roller Moth; wings closed

moths will lay eggs on the fruit in late August and early September and from these worms will be hatched and burrow into the apple. However, the problem of controlling this pest successfully is easier here than in places like Southern Ontario where there are two distinct broods during the growing season. Spray as per applications 3 and 4.

The Apple Maggot or Railroad Worm (Rhagoletis pomonella) The adult stage of this insect is a fly somewhat smaller than the ordinary house fly and easily distinguished by transparent wings crossed by four irregular black bands. These flies are active from about the first week in July to the end of the summer, and during this time the eggs are laid beneath the skin of the fruit. The maggots are hatched and tunnel through the pulp of the apple with the result that it falls permaturely to the ground and the maggot then comes out of the apple and passes the winter in the soil in the papa state. Since these maggots never break through the surface of the apple until they are theough feeding, it is clearly of no use, whatever, to attempt to poison them with an arsenical spray. The only effective remedy is the immediate destruction of the fallen apples, in order to prevent the maggots emerging and entering the pupa state. Sheep or swine may be used to advantage. Tbis insect is already in the province and if allowed to spread may become one of the worse pests we have on account of the difficulty in combating it.

Plum Curculio. (Conotrachelus nenuphar) These in many cases will attack apples and are apt to be abundant in old neglected orchards.



Canker-worm; *a*, eggs, natural size; *b*, magnified; *c*, caterpillar; *d*, cocoon; *e*, chrysalis; *f*, male moth; *g*, female moth.

KNOCKS SPOTS OFF ANYTHING!!!

Niagara Lime-Sulphur.

The best known Spray for Apple, Plum, Pear and Cherry Trees.

It will keep the spots off apples better than Bordeaux. Besides, it does not russet the fruit or injure the foliage like Bordeaux has been doing for the past twenty-five years in the Annapolis Valley.

No weighing, straining or clogging of nozzles if you use NIAGARA LIME-SULPHUR. It is all forced through 10 oz. canvas by a powerful FILTER PRESS, eliminating all sludge or sediment, which Cornell experiments have proven to be of little value. Therefore, when a farmer buys an unfiltered LIME-SULPHUR, he is paying for a mud we are dumping out at the works.

Order at once. Our factory is running night and day.

Be sure to use SWIFT'S ARSENATE OF LEAD with our LIME-SULPHUR. It is the old reliable.

Write for our SPRAY CALENDER, telling how and when to Spray. Also prices on LIME-SULPHUR and ARSENATE OF LEAD.

Niagara Spray Co. of Nova Scotia, Ltd.,

KENTVILLE, NOVA SCOTIA.

From the time that the apples have reached the size of a small pea until the end of July or possibly later, the female beetle bores a hole in the side of the fruit, deposits an egg in it and then makes a crescent snaped cut beside it so as to undermine the egg and prevent it from being crushed by the growth of the fruit. The

Datana Moth.

Moth of the Red-humped Caterpillar.

The Red-humped Caterpillar.

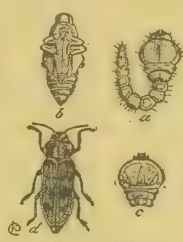
tiny grub that hatches bores into the apple devouring the flesh. The fruit drops prematurely—the grub emerges, buries itself in the soil and then passes into the crysalis stage and finally emerges as a beetle, in about a month from leaving the fruit. This new generation of beetles feeds on the apples until they reach

San José Scale.

maturity and often disfigures a large percentage of the crop. They leave the trees in the fall and hibernate as beetles under old rubbish, etc. Application No. 3 will kill many of the adults while they are feeding on the foliage prior to laying their eggs. The first fallen apples and fruit falling later should be destroyed. All rubbish brush, etc., around the orchard should be destroyed. Clean cultivation is helpful.

THE MORE IMPORTANT FUNGUS DISEASES OF THE APPLE TREE.

Black Spot Fungous or Scab, (Venturia inequalis). One of the most wide spread and destructive diseases which the orchardist has to fight. It often renders a large portion of the crop unsaleable or unprofitable. Some varieties grow scab free while others such as Famuese, McIntosh Red and apples of similar type are especially subject to it. It works on small twigs, buds, leaves and fruit. It winters over on leaves under trees and not on the twigs. Scab spots will develop on fruit after it has been picked and placed in storage and the higher the temperature of storage the greater the deterioration of the fruit. Damp weather and wamth liberate the spores from the leaves in the spring and they rise and settle on the buds. It is important to remember thzt spraying here is preventive not curative. By coating the spores or surfaces on which they are liable to alight with a fungicide their germination is prevented, but once they have germinated the fungicide will not kill them. Spray as per applications Nos. 2 and 3. Development of buds and fruit and weather conditions will determine the necessity and number of subsequent sprayings.



—Flat-headed apple-tree borer: *a* grub, *b* pupa, *c* enlarged head and following segments, *d* beetle.

Black Rot Canker.—Occurs on the leaf, fruit and tree. Is quite frequent

San Jose Scale.

Soiling Crops an Essential For Successful Dairying.

HORNED CATTLE PER ACRE IN CANADA.

On the range in Western Canada, the best ranchmen allow from 15 to 20 acres per head. Where more animals are carried results are unsatisfactory.

In the two provinces, Ontario and Quebec, the average farmer carries about one bovine animal for each six acres of land. Exceptions of course may, and do occur, where heavier stocking is successfully practiced.

With conditions in the Maritime Provinces I am not quite so familiar, but statistics lead me to believe that only about one bovine animal is carried on every twelve acres. Various influences go to effect the number of cattle carried in the different parts of Canada, but probably the most potent factor in controlling number of animals carried on the average farm is the amount of feed produced for wintering the cattle; this, of course, again being influenced by the area that must be devoted to pasturing the cattle during the grass season.

That very much heavier stocking might be practised is proven by the success of many of our most progressive and more energetic stockmen in the Maritime Provinces, as elsewhere, who succeed in carrying as many as one head of cattle for every two or three acres of land, and this without buying food other than concentrates feeds.

Throughout the Maritime Provinces, on account of the large proportion of waste or rough pasture land, the object of every farmer should be to increase the cattle carrying capacity of his farm, and by so doing increase the fertility of the part possible of cultivation.

CARRY MORE CATTLE

In the writer's opinion, the only profitable way to improve the average Canadian farm is to carry more stock. Generally speaking the difficulty lies in getting good feed for the stock in summer rather than winter. The average farmer depends for revenue upon the milk product of his cows in summer, and, if pastures fail or insufficient land has been allowed, then the product falls short and a small revenue is the result. The effect of this is, too frequently, the reduction of the number of cattle carried, rather than an effort to increase the capacity of the farm, whereas the reverse should be the case and if the effort were made along right lines, satisfactory results may be anticipated and stock increased rather than decreased in number.

As already stated the greatest difficulty in the way of increasing stock seems to be found in the difficulty of carrying them successfully during the summer months.

SOILING CROPS THE SOLUTION.

As a means of solving this problem soiling crops have been found most effective, and where soiling crops have been used, the writer has found it most advisable to devote a certain part of the farm to the cultivation of soiling crops exclusively.

A THREE YEAR SOILING CROP ROTATION.

The soiling crop rotation which I have found the most useful and satisfactory is of three years duration. The crops grown in the Ottawa district to the best advantage for this purpose are clover, peas and oats, rye, millet, corn and roots. These, with possibly one exception would prove satisfactory in all parts of Nova Scotia. Corn is, I believe, not always a success in every part of Nova Scotia, but where it can be satisfactorily grown, it should, in my opinion, enter largely into the soiling crop system at least, if not into the general cropping system on the farm. The treatment of the land under such a soiling crops rotation as indicated above, would be as follows:—After clover has been removed for green feed, the forage from the other two lots might be fed thereon so manuring that plot, or, if it was not considered advisable to feed thereon, then the clover field should be ploughed in the fore part of August, cultivated at intervals during the months of August, September and October, and ploughed again in the latter part of October, barnyard manure having been applied at the rate of 15 tons per acre, previous to ploughing. Next Spring sow peas and oats, corn, rape, white turnips, millet in proportions best suited to requirements and available labor. This land should be ploughed in the fall. Next year, sow peas and oats, 3½ to 4 bushels per acre, sown at three seedings, first as early as possible, second, ten days later. With the peas and oats sow red clover at the rate of 8 lbs. per acre. If an extra early crop is desired, part of this field might have been sown to fall rye, that part on which peas and oats or rape had been grown, being the portion most advisable to use for this crop. Where fall rye is grown the seeding to clover would need to be done the next spring as soon as the land was fit. By following this arrangement on each of the three plots set aside for the soiling crops, feed therefrom would be available from about the middle of June till the end of October. The size of the plots would of course depend upon the amount of arable land in the farm and the amount of pasture land available.

AREA REQUIRED.

Where rough pasture lands are scarce, then the writer has found it advisable to use about 20 p. c. or one-fifth of the arable land for soiling crops. Of course, if the supply is found to be more than sufficient for the needs, these crops can be harvested and stored away as any other crops for winter use. Where considerable pasture land is available, a fairly safe rule is to allow three acres of soiling crops to each ten head of cattle.

Where proper roatations are followed, the stock carrying capacity of the farm is very great indeed probably as high as one bovine animal for each one and one-half or two acres of arable land; this of course, in addition to the stock of horses necessary to do the work.

METHODS OF FEEDING.

As already mentioned these soiling crops might be fed on one of the fields devoted to growing soiling crops, preferably on that field intended for hoed crops next season. If any part of either the rotation pasture or the permanent pasture needs toning up, the hauling of the feed to this particular spot and feeding it thereon for a few days would most materially benefit the section in question. But, generally speaking the best plan of all to adopt in soiling crop feeding, is to feed in the stable. Then each animal gets its fair share; all the manure is saved and can be used to the greatest advantage; when necessary supplies may be stored for a day or two at least inconvenience, and cattle come most willingly to the stable to be fed and milked.

SOME SOILING CROPS.

Certain crops have been mentioned and indicated on the plan as suitable for soiling crop purposes. Below follow a few remarks on the more common and most to be recommended crops for use in the Maritime provinces:

1st. Alfalfa—This crop does best on well drained light loam that has been manured the previous year. The land should be thoroughly prepared and seeded down not later than the middle of July at the rate of about twenty-five pounds seed per acre. If growth is very strong it should be clipped with a scythe or a high cutting mower not later than the first week in September. The field for alfalfa should be apart from the regular soiling crop rotation, since alfalfa may last a number of years, and does not as a rule do its best until about three years old. Alfalfa may be used the latter part of June, again the fore part of August and possibly a third cutting in September. It should be fed rather sparingly and if possible in conjunction with some other rough feed. Alfalfa is probably the most valuable of all rough feeds for milk production.

2nd. Red Clover.—Does best on well drained light loamy land, but will succeed upon any kind of land provided it is in fair,y good heart and fair,y well drained. Should be sown at the rate of 8 to 10 lbs. per acre, with a-nurse crop in the spring

3ed. Alsike Clover.—Will take the place of red clover in heavy, badly drained soil. Sow about 4 lbs. seed per acre.

4th. Crimson Clover.—Might do in some parts of Nova Scotia. It should be sown in August and used early next summer, say June or July. Sow 15 lbs. per acre on light soil in good tilth.

5th. Peas and Oats.—This crops does well on any kind of soil, provided it is in fairly good heart. May be sown as soon as the land is fit and as late as the end of June, at the rate of about 4 bushels per acre; one part peas, four parts oats by weight. Feed when in milk stage or earlier if necessary.

6th. Peas, Oats and Wheat.—Sometimes the addition of a small amount of wheat to the mixture proves satisfactory.

7th. Vetches.—Various varieties are in common use in Canada; the white or black seem to be equally good. They do well either alone or mixed with oats; generally speaking the earlier sown the better. If season is favorable, two cuttings may be made. They will do well on any kind of land in good tilth and fairly well drained. Sow 1 bushel per acre alone, or with an equal amount of oats. Hairy vetches are sometimes used, but the great cost of the seed renders their extensive use inadvisable.

8th. Fall Rye.—Will do best on light soil. Land may be quite poor and still yield a satisfactory crop of fall rye. Sow first part of September. If clover is to be grown with it, sow on the following spring amongst the rye, running a light harrow over the crop after the clover has been sown. Sow one bushel rye per acre. Cut when heads are just shot. Feed carefully as it is apt to flavor milk.

9th. Soy Beans—These do well in fairly heavy land. Should be sown at the rate of from thirty to forty pounds per acre. Sow in drills ten to twelve inches apart. Green variety best.

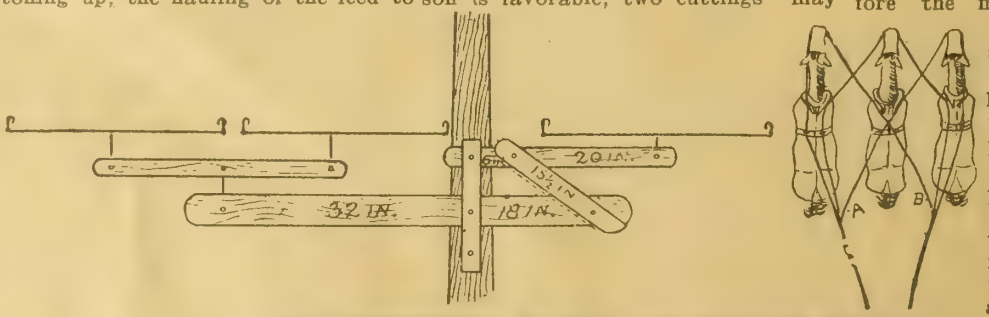
10th. Corn.—This crop is undoubtedly one of the best soiling crops grown. Use early varieties, chiefly Longfellow, Angel of Midnight, Compton's early; in addition a small amount of some larger variety such as Leaming. Sow in hills three feet apart each way. Sow as soon as the soil is warm at the rate of from four to six kernels in a hill. Feed when convenient, but preferably when in milk stage. Corn should be kept well cultivated until the 20th of August or thereabouts.

11th. Rape.—This plant is one of the best milk producing crops that can be grown, but if fed in large quantities is apt to flavor milk. Will not do well on newly ploughed sod land. Prepare seed bed and sow broadcast or in drills, about two feet apart at the rate of five or six pounds per acre. Pasture off, or feed off as convenient. Rape will do well on any land rich in humus, be it heavy or light.

12th. White Turnips—The turnip may be sown as late as the end of July and still give satisfactory results. It does best on light loamy soil and land should be in good tilth in order to insure quick growth. It should be fed to dairy cattle with moderation although not so apt to flavor milk as is rape.

13th. Swedes.—Sow earlier on fairly light land and may be fed off later than white turnips.

14th. Millet.—Various varieties of this plant are possible and advisable of cultivation. Its great value lies in the fact that it may be sown quite late and still be available for feed at a fairly early date. One of its chief uses is to sow where meadows have been killed out, or where the catch of clover has been poor. Land should be well prepared, well manured if possible, aad should not be cold bottomed. The kind of soil is immaterial, provided it is well drained. It should not in any case be sown before the first days in July, and should be cut just as the seed is formed. Sow from thirty to forty pounds per acre. Many varieties are known. Barnyard Millet and Hungarian grass are probably the best. —By J. H. Grisdale, Agriculturist, Central Experimental Farm, Ottawa, in 1908 N. S. Agricultural Report.



A Three-Horse Evener and Reining System.

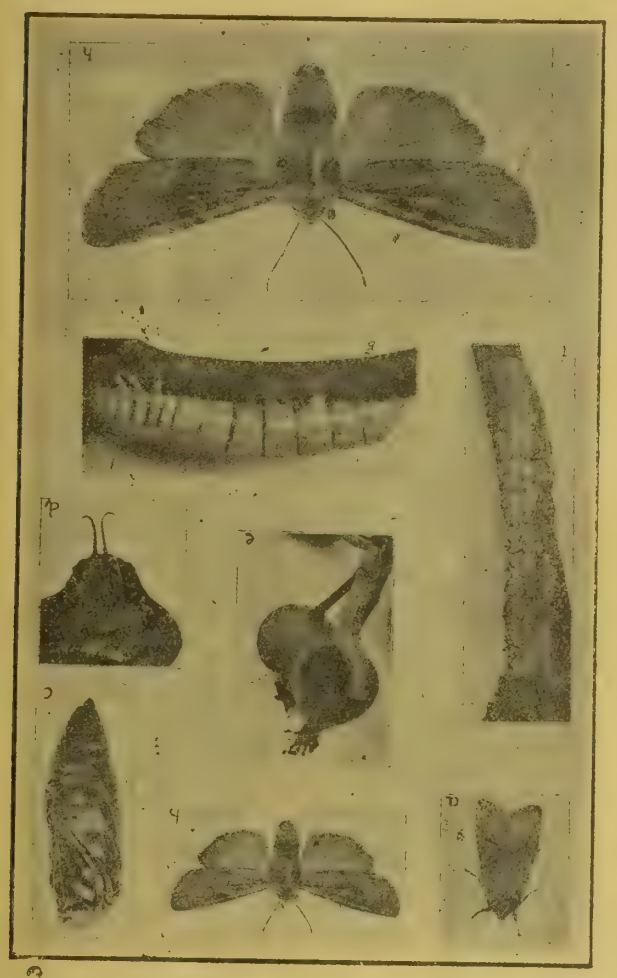
tree it appears in the form of large patches of dead or dying bark more often in crotches. In two or three years whole branches are killed, the canker eating in and the bark cracks and becomes roughened and finally drops off. Small canker spots will be found on younger branches. On the leaf it appears on the upper surface as a small purplish spot which will increase in size until as much as a ¼ of an inch in width and the color in the centre changing to brown and gray. On the fruit it starts as a brown rot which changes gradually until black and producing black in old or neglected orchards. On the mummied fruits. The rot is firm not soft as in other cases and is other cases and is often marked by concentric lines of growth and in the last stages is dotted over with minute pimples containing spores.

Remedies.—Clean up and burn all growths attacked beyond recovery. This is best done in the spring, sometimes in April. Where the infection is not too severe trim the cankered areas to new clean bark, disinfect the wounds with corrosive sublimate solution, and coat with a heavy lended paint. The corrosive sublimate can be bought at any drug store but it corrodes metal and should be mixed only in a wooden or glass vessel. Black Rot Canker generally starts as a result of wounds due to poor pruning, careless cultivation and injuries from sunscald and mice. In well cared for orchards where spraying is annually practiced for the prevention of scab, etc., hardly any trouble will be experienced with canker.

Apple Leaf Spot.—(Phyllosticta)—A common disease on apple leaves, light colored spots, somewhat circular in outline, having a lighter portion surrounded by a redish ring are scattered over the surface of the leaves. These spots are not larger than from one-eighth to one-tenth of an inch in diameter. This disease is not serious and is easily controlled by the application made for the apple scab.

Sooty or Fly Speck Fungous.—(Leptothyrium pomi.) A fungous growth appearing in sooty roundish patches on the apples. These patches may run together despoiling a large surface of the fruit. It appears late in the summer and will require a late spraying of Lime Sulphur 1-40. Like the scab it spreads in storage and slightly affected fruit should be sold for immediate consumption. Not prevalent in the province.

NOTE.—The foregoing description of insects and fungous pests of the apple are of necessity abbreviated. Persons however, who desire fuller information of the life history and habit of these may receive the same by writing to this Department.



Green Fruit Worm in its Various Stages

The four points to be observed in selecting a good dairy cow was the subject of an address made by O. C. Gregg of the St. John's Farmers' Institute:

1st. Large body and especially middle piece, indicating a capacity for eating and digesting a lot of food.

2nd. Thinly fleshed backbone and especially back of the shoulders. This indicates that the food is not made into flesh.

3rd. Large udder, as it is here that the milk is made.

4th. Large clear eyes. This indicates good nerves, and they drive the organs of digestion and milk making.

Mr. Aspinwall's latest for the season of 1911

Aspinwall Potato Planter No. 3.

Have You Seen It?

The result of 45 years experimenting.

No other Planter can compare with it.

A marvellous construction, with a new picker that drops 99 and a fraction per cent. good. With reasonable uniform seed the misses have frequently been less than one in five hundred. **The machine plants a greater range of seed,** both as to size and shape, than ever before, and handles it with the least possible friction or wear. **No removal of pickers required** to regulate the distance of planting, simply a change of gear wheels, which can be made in less time than it would take to change one picker. In lieu of the cumbersome wooden structure, a Canvas Hopper has been substituted, which overcomes all tendency to clog or bridge with either whole or cut seed.

Both the feed and cover tension are regulated from the seat. No removal of bolts, simply turning a thumb screw does the work.

Withal, it is the lightest in construction and draught, the most beautiful in design of any planter ever made. We have a good supply on hand.

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

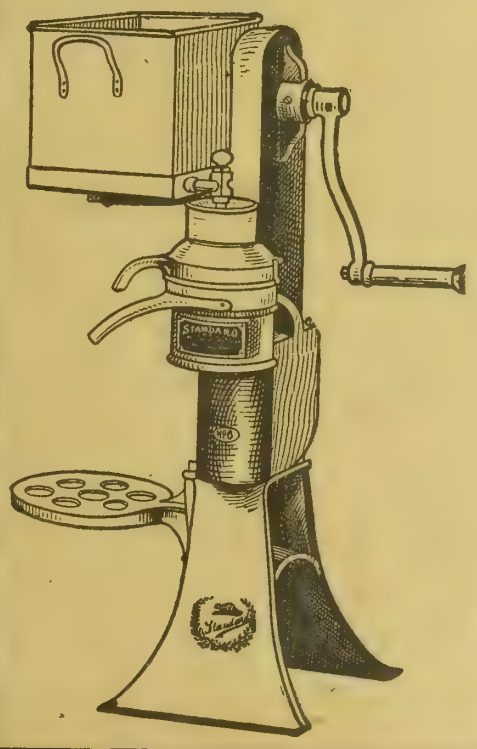
I will mail, free of any charge, my home treatment with full instructions to any sufferer from women's ailments. I want to tell all women about this cure—you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhœa or Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar to our sex.

I want to send you a complete 10 days' treatment entirely free to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that it will cost you nothing to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week or less than two cents a day. It will not interfere with your work or occupation. Just send me your name and address, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you free of cost my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it and learn to think for herself. Then when the doctor says—"You must have an operation, you can decide for yourself. Thousands of women have cured themselves with my home remedy. It cures all, old or young. To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this Home Treatment really cures all woman's diseases and makes women well, strong, plump and robust. Just send me your address, and the free ten days' treatment is yours, also the book. Write to-day as you may not see this offer again. Address:

MRS. M. SUMMERS, Box H. 309 - - - - WINDSOR, Ont.

The Most Attractive Agency Proposition



ever offered is the Standard Cream Separator agreement. Although our organization in the Maritime Provinces is not more than a few weeks old, territory is being covered rapidly and every day's mail makes it harder for you to get an agency. Write at once telling us what territory you are in a position to handle. Do not delay. Our proposition is so attractive that even now nearly every territory is taken up.

We help our agents by advertising our machines and turn prospects into agents when replies are received from their territory. Following are a few interesting facts: —

The new "STANDARD" book, just published, tells about the latest achievements in cream separators. It is not made up of FICTION, but of FACTS.

It describes the perfect running, perfect skimming Separator shown here and explains why a Separator that runs in a bath of oil lasts longer and runs easier and steadier than one depending on an oil can and glass lubricators.

It also explains why the "STANDARD" Separator gets more cream from the milk that can be got with any other Separator.

YOURS FOR THE ASKING.

Write us now and you will be sent one of these booklets, postpaid, free of charge; also the facts of a recent contest at Port Rowan, Ont., in which the "STANDARD" demonstrated its skimming supremacy.

WRITE NOW.

Farm Gates and Fences.

There are few modern improvements upon the farm that give an index of the condition in which the farm is kept and the attitude of the farmer himself towards modern progress more quickly than gates and fences. The disreputable, broken down, ill kept fence and the gate that has long since ceased to swing upon its hinges are alike indicative of carelessness and indifference. Further than this, they signify a shiftless owner who takes little interest in the appearance of his place and who has not been particularly fortunate in its management.

In our boyhood days too many of us have been familiar with these makeshifts which lie half buried in the snow and must be shoveled out every time a storm comes. The old-fashioned farm gate was made to slide upon a single board and was susceptible to every change of weather, becoming loaded with moisture until it was so heavy that it was almost impossible to move it. Then when the cows reached over the fence and tried to nibble the luscious grasses that were just beyond their reach the gate would give way to the strain, the board would break and when the mending was done a few more pounds would be added to the already overburdened structure, making it a little harder to handle and making it more readily broken because this added weight would furnish a constant strain. These old patched up, heavy gates were the bane of the boy's life and they were always more or less dangerous lest they should give way and let the cattle through into the fields where they could do damage to growing crops, and oftentimes jeopardize their own lives. One valuable animal lost in this way would pay for enough gates to equip the whole farm.

There is one kind of a gate, that is familiar to every farm boy; that is, the small stake to which four or five barb wires are stapled. This is usually held in place with a loose, rusty wire loop that fits over the top of the stake. A few tugs tighten the gate so that it is possible to lift off the restraining latch carrying the dangling wires around into the field and letting the team pass throigh and afterwards straightening them as well as you can, pulling them until the stake is back in place again. There is always more or less discomfort in opening a gate of this kind and it is not uncommon to have the man at the post come out with his raiment or hands the worse from the erratic action of the barb wires It is a lamentable fact that gates of this kind are very common.

The right kind of gates are those that are easily manipulated, light, practically indestructible and free to swing either way, yet strong enough to keep the frisky calves and colts from jumping over.

The modern farm gate and the modern farm fence are both neat, attractive, economical and necessary conveniences upon the modern farm. They do not represent a very formidable first cost, their up-keep is extremely modest and their value is three fold. In the first place, they fulfil the purpose for which they were intended, protecting both the growing crops and the stock in an absolutely safe and sure way.

In the second place the farm gate is a great convenience because it is serviceable at all times of the year; it does not get out of repair; it is easily handled and it is always effective.

In the third place, good gates and fences are of financial value because they add to the worth of the farm when it becomes desirable to put it upon the market. The farm that is well fenced and that is supplied with good gates will always sell for more money per acre and it will always find a more ready sale than the one upon which the fences are broken down and the gates half buried with snow in the winter time or falling to pieces in the summer. Further than this, the man who keeps a well fenced farm usually has a well built barn and keeps it well filled with good stock; that is, the man with the well fenced farm is always more prosperous than his less fortunate neibor.—Hoard's Dairyman.

Home Grown Root Seed.

It has been an unanswerdd question, uppermost in the minds of many farmers and vegetable growers for several years past if it is possible in Canada to produce garden and field root seeds of good germinating qualities. At the present time, and in fact from the days of the early pioneers, these seeds are and have been imported. Most of the turnip seeds come from Great Britain, mangel seeds from Germany, France, England and a few from Denmark. Carrot seeds come principally from France. This question was asked of Mr. Geo. H. Clark, Dominion Seed Commissioner.

"We have no farmers that fully understand these seeds," said Mr. Clark. "It is exceedingly technical work and another reason is the amount of hard labor required. The price of labor in Canada is so high that we cannot grow in competition with the cheap labor in European countries. France is commonly called the seed garden of the world and the seed crops grown there are produced on small farms by peasant farmers with large families who are trained in the work from childhood.

"Our soil and climate is probably better than any in Europe for growing and maturing the principal kinds of our field root seeds. This has been quite clearly demonstrated by experts who have conducted experiments under the direction of the seed branch in a German settlement near Waterloo, Ont. The quality of the seed produced has proved to be superior to the imported stocks when tested at Guelph, Macdonald, Truro, and other experiment stations. If we are to get the best results from our field root, garden and vegetable crops in Canada we must by breeding and selection produce varieties and types of these crops that are specially adapted to our climate and have the seed from them grown in Canada under proper inspection as adopted by the Canadian Seed growers' Association.

"The experiments which have been made at Waterloo, which were conducted by an experienced seed grower from Germany, have furnished information thbt will enable this department to proceed in a more general way in the encouragement in growing turnip, mangel and vegetable crops. We hope to have a few farmers, who are graduates of the agricultural colleges take up this special branch of work with mangel seeds this spring. On account of the difficulties that are experienced with cross fertilization and in consequence of the breaking up of desirable types it is necessary that the work of growing the seeds of these crops be done by men who have a thorough knowledge of the science as well as the practise of agriculture. Some improvement has been made in quality of the seed of the field root and garden crop for sale in Canada through the application of the Seed Control Act but that act can be made to apply only to the vitality of the seed, which although important is much less important to the grower than producing seed for planting that is true to the desired variety and improved by a process of selection year by year.

"Practically no mangel seeds are grown in Canada except those that are grown in Waterloo County. A few of our Scotch and English settlers, who are accustomed to growing turnip and other vegetable seed for their own use in their home land have for many years been growing small quantities of turnip seed for their own use in Canada.

"Onion seed is now being extensively grown near Brantford, Ont., and small quantities have been grown for many years by a French-Canadian market gardener near Portage la Prairie.

"The Dominion Canners Limited has just recently taken over possession of the Bow Park farm near Toronto. The farm consists of 961 acres. It will be turned into a large seed farm. It is expected that the company will give its attention principally to the seed crops that are required by their canning factories. The company's expert in seed growing and selection was formerly connected with the Dominion seed branch at Waterloo. He and his family had direct charge of the experiments in seed growing, which were being conducted under contract from the seed branch here at Ottawa."

The Thin Hulled Oat.

An expert grain grower calls attention to the greater feeding value

The Nitrogen Your Crops Take Up Counts; Not the Nitrogen in Your Fertilizer

The most available source of nitrogen is

Nitrate of Soda

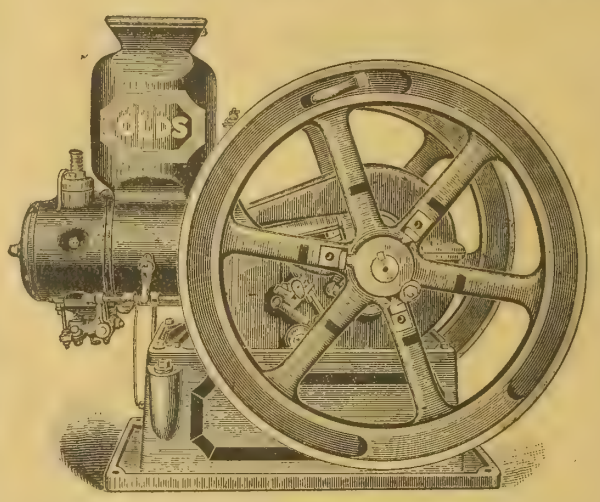
Your crops can not make use of nitrogen in any form except the nitrate.

Give it to them that way. If you don't you'll have to wait for a change in form to take place before the plants can feed on it. All the nitrogen in Nitrate of Soda is available. Not one atom is lost.

These factors make Nitrate of Soda the cheapest form of nitrogen. You get all the benefit of what you buy. Cheapest—quickest—cleanest. Let us give you prices.

CHEMICAL LABORATORIES, Ltd.,
148 Van Horn Street, Toronto, Canada.

Important Announcement



We are pleased to announce that we have completed arrangements whereby we become the sole Sales Representatives for the well-known OLDS GASOLINE ENGINES throughout the Dominion. These engines are manufactured by the Seager Engine Works—which Company, under the name of the Olds Gas Power Company, was one of the pioneers in the manufacture of Gasoline Engines, and the Olds Engines have come to be recognized as the standard of efficiency among the large number of Gasoline Engines now on the market.

The uses to which a Gasoline Engine can be put are many, and it has come to be recognized as a very necessary item in the equipment of an up-to-date farm. This latest addition to the Massey-Harris Line is in accordance with our policy of supplying the very best of everything needed by the farmer. More information will be given later—but in the meantime if interested in the Gasoline Engine subject we shall be pleased to hear from you.

MASSEY-HARRIS CO., LIMITED,
MONCTON, N. B.

of thin-hulled oats as compared with those with thick ones.

As oats are the leading grain crop in Maritime Canada and the bulk of them are fed to stock on the farm, the farmer should be doubly interested in growing those which possess the highest food value. There is a variation of from 20 to 50 per cent. of husk between varieties. When we consider that husk, or hulls, have practically no feeding value we can see the importance of growing a variety, having a thin hull.

Take oats with 20 per cent. hull. This means that every bushel contains 27 1-3 pounds of kernel and 6 3-4 pounds husk. Take other varieties with 50 per cent. hull, and we have only 17 pound kernel—a difference of 10¼ pounds per bushel. Knowing the high vqlue of oatmeal as a food for man and beast—better than wheat or barley meal, and nearly as good as peas—we cannot fail to see the great difference between the two in actual value. Taking oats at 40 cents per bushel there is a difference of 15 cents per bushel in favor of the thin-hulled variety.

Taking the average of 10 acres on each 100 acre farm, with a yield of 40 bushels to the acre, we get in a thin-hulled variety two tons more nutriment than in a thick-hulled one. This being so, is it not worth our while to see that we sow the right varieties? Nor is this the only advantage. Heavy hulled varieties are not heavy yielders. In our experience they do not yield as well as the light hulls do; besides they require more moisture to germinate them. This tells against them in a dry spring, and for this same reason, seed grains wi,l often germinate before fall plowing and consequently they grow up the next spring to the deteriment of the succeeding crop. A thin-hulled oat is known by its wide open bosom. Lay a kernel with its oval side downwards, the bosom will then be up. There should be a good space with only a film over be observed. We cannot name varit. In a coarse oat the opposite will ieties—they are far too numerous, and we expect some varieties have many different names. The Banner, Abundance, Siberian, Lincoln and Thousand Dollar are among the best, while Tartar King, Storm King, Egyptian and Early Gothland are among the objectionable varieties. because while they weigh, look and handle well, the nutriment is not in them.

Another point is that thick seeding increases the amount of hull. This is because more plants occupy the ground than can be supported, and the result is that a goodly number of imperfectly developed grains are produced. Plumpness in all the grains is to be sought after. This can be obtained only by giving each plant sufficient space for full development. One bushel of first-class seed per acre will put the grain two inches apart in rows seven inches wide. This should be sufficient on land of good fertility; one and a half bushels by measure should be sufficient in any case. Heavy seeding, especially of inferior seed, is the real cause of so many light oats and of the so-called blighted grains with nothing in them.

Quality in Potatoes.

Fortunately the factors which seem to influence quality in potatoes are within the control of the thoughtful potato grower, writes an expert, commenting on the lack of knowledge in one branch of this subject. It is perhaps a little singular that so little attention has been paid to the culinary side of the matter, to what really constitutes a good cooking potato. The shape and appearance are thought much of, but the potato should be followed to the kitchen to form a practical judgment Boiling quality varies much, we know, and expert cooks have to try various methods of boiling and of steaming, at different temperatures, before they can get the best results in some cases.

FLOURINESS.

This seems largely to turn on the arrangement and number of the starch cells, not apparently, perhaps, an important matter, until it is realized that the palatability and flouriness of potatoes are intimately connected with the proportion of water and starch that they contain. Good quality largely depends on a high percentage of starch, and hence the necessity of plenty of light and heat for its formation. For this reason, too, probably, an open soil is best, because it is warmest. The soil temperature and that of the air seem to have a very important bearing on the flouriness and taste, according to recent experiments on the subject — more, probably, than manuring, which gives very unequal results.

SOIL AND WATER.

Manuring is a very important matter, for too much is heard of different kinds of manuring and bewilderment arises. The water supply and the kind of soil are also factors largely detetmining quality experiment seems to prove. The best tubers come from soils which contained both gravel in some form—which means warmth and porosity—and clayey matter, which means that the water is retained in the soil. Climate is, therefore, very important also because it affects these points, and for this reason a heavy soil may be sometimes better than a light one, because in a warm, dry climate it is not so easily affected in this way as a light and porous one.

STORAGE AND HANDLING.

Another factor which affects cooking quality is storage and handling, and the effect of the former was shown in some elaborate experiments made a few years ago. When slowly boiled in cold water and partially steamed, the samples were "markedly superior to the others" in flavor, texture, and appearance. However, the same varieties, did not give the same result. Scotch-grown kinds then gained the highest points for the same qualities, and after standing twenty-four hours they and several others had darkened and deteriorated. It is satisfactory that good qualities such as these are closely connected with breeding and improvements, and it is to be hoped, therefore, that they will go hand in hand with selection for keeping qualities and other matters hitherto so much insisted on.

Weed Seed in Manure.

J. M., P. E. I.—I have some cattle manure where the cattle have been fed with hay mixed with rye grass and bedding mixed with noxious weeds. If this pile of manure is left in bulk to decompose through the summer until next September, will this wild seed be killed or lose its germination? If not, what is the best method of handling or using this manure so that weeds will not grow on land where it is put?

It is the practice of experiment stations to put the manure from the different animals in piles and permit it to rot. This process is called composting and it makes the manure uniform in quality and destroys the weed seed through fermentation. Very few, if any, of the weed seeds that have been in the compost for any length of time sprout. We do not know of a better way to handle manure containing weed seeds than to put it in a pile to ferment for four to six months.

DAIRYING.

Too Much Butter Fat.

The motive which, above all others appealed to the law-makers of Minnesota, when they enacted that milk sold for food should contain not less than 3.5 per cent. of butterfat, was the protection of children from the use of impoverished milk. The popular idea has been that, the richer the milk in butterfat, the better it is for the child. There were some who claimed that the Minnesota standard should be set even higher.

There are some wise mothers, however, who have learned that the milk of the cows most prized in the dairy is too rich to be fed in its natural state to young children; and that it is better to dilute if for their use with a liberal amount—say one-quarter to one-half, or even three-fifths—of warm water. The judgment of these mothers is supported by the authority of Prof. T. L. Haecker, who declares that milk of the standard now required in this state is too rich for the stomachs of children.

Professor Haecker has arrived at this conclusion as the result of a series of observations on both children and young animals, covering a long period. He found, first, that children thrive better on milk containing but a comparatively small amount of butterfat than upon the richer milk of the pure bred cows at the experiment station. While no one can be more zealous than is Professor Haecker in advocating the breeding of cows capable of a high production of milk rich in butterfat, for the manufacture of butter, he thinks that a mistake is made in feeding such rich milk undiluted to children. What is not best for the calves can hardly be considered best for children. He finds that if the calf of a cow whose milk is very rich in butterfat is allowed to nurse at will, the breeder is very likely to have a bad case of indigestion on his hands the next day, if he is not minus a calf.

It would appear that the surpassing richness of the milk of certain breeds of cattle is the result of a gradual long-continued departure from natural conditions, under which the milk, while less valuable for butter-making, was on the whole better adapted to the use of growing children, and that a return to those conditions might therefore contribute something to the cause of health and the reduction of infant morality. It is suggested also that if the attention now given to securing 3.5 per cent butterfat in all milk sold to the public should be diverted to securing greater purity through scrupulous cleanliness in all the operations of the dairy, the gain to the children would be furthered precptibly.—Press Bulletin Minnesota College of Agriculture, by C. R. Barns.

Dairy Herd Competitions.

The Dairy Herd Competition conducted for the past five years by the Dairymen's Association of Western Ontario is of benefit to the dairy industry.

The object of this competition is to point out, through local illustrations, the value of keeping cow records and to stimulate interest in increased production.

The publicity given the results of these competitions from year to year by speakers on dairying, the Dairymen's Conventions, the agricultural press, and in other ways, brings to the attention of large numbers of dairymen what can be done by proper handling of what were, in many cases poor herds a few years ago. The cheese and butter makers take an interest in this competition and do whatever they can to induce their patrons to increase the production from their cows that they may enter their herds in one of the classes.

Those who enter the competition are always kind enough to give the public the benefit of their experience in building up herds which will yield a profit per cow irrespective of market conditions.

Producers in different parts of the country make personal inquiries from the competitors asking for information which will help them in handling their herds to better advantage.

In nearly all cases those who enter the competition began a few years ago with very ordinary cows and by following out for several years a system of weighing and testing the milk from each cow, discarding after a fair trial the poor cows using only pure bred sires from good milking ancestry, raising the heifer calves from the best cows, exercising good judgment in feeding, have been able to prove that such methods will bring results.

By arousing interest among producers through this competition it is quite evident that a great number will take advantage of the opportunities offered for weighing and testing the milk, and we are sure that once a man can be induced to try better methods he will soon become convinced of their value.

Facts which are brought out locally regarding a herd which at one time probably averaged 4000 lbs. per cow for the milking period is, after a few years of tried methods built up to average 8000 lbs. per cow must have a good influence on all neighboring dairymen, who inquire how this was done and evidence a desire to follow similar methods, so that the influence of this work is wide spread.

Understanding the wide publicity which the competition receives and knowing that increasing the production per cow is one of the chief fac-

Cream Profits That Stay in Your Pocket

Empire Disc

THERE was a time when the first cost of a cream separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless Empire

Empire Line

Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest returns for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

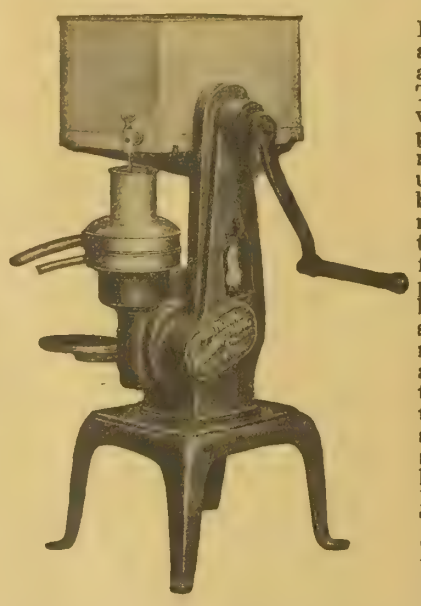
Empire Cream Separator Co. of Canada, Ltd.

Sussex, . . New Brunswick

Farmer Agents Wanted in Unrepresented Districts.

We Now Have Ready for Delivery

The New Capital Separator



You will recognize at once the LOW TANK feature of this type and the solid yet attractive appearance of the machine as a whole. THE BOWL is the same as we always used. The lightest, most compact, easiest washed bowl on the market. BALL BEARINGS are used throughout the machine, thereby reducing friction to a minimum, making the machine extremely easy to operate. THE GEARS run in a film of oil produced through the phosphor-bronze spiral gear wheel being continuously immersed. The same CLUTCH DEVICE that has made the Capital famous has been adapted to this type, so that when the handle stops all gears, except the one running in the oil, are instantly stopped, and nothing but the soft whirling noise of the bowl can be heard. WHEN GEARS DON'T RUN THEY CAN'T BE WEARING. This advantage is apparent to every one. Notice also the high crank; the centre of the crank shaft being about 2 feet, 9 inches from the floor, which permits the operator to assume almost natural position when turning. This type is made in two sizes, No. 6, capacity, 500 lbs. per hour; No. 8, capacity 750 lbs. per hour. We are **not** discarding the former style of Capital, which has deservedly won many friends, but we are introducing the above style so as to give purchasers a variety to choose from.

A postal will bring you full particulars of our Free Trial Offer. Address nearest branch.

CARRIAGES!

MAPLE LEAF LINE.

"It Will Pay You to Wait."

In order to introduce our goods in the Province of New Brunswick, we are making a large shipment of high grade Carriages to Moncton about May 20th, and will arrange to have the work set in some central place where it can be inspected by any who are interested.

Newest designs—finest finish—fully guaranteed by a thoroughly responsible Company. "Attractive Prices."

See daily papers, May 27th, for time and place.

St. John Telegraph & Sun; Moncton Times & Moncton Transcript.

DOMINION CARRIAGE CO., Limited, = Toronto

tors in successful and profitable dairying, our Association considers this competition one means of increasing interest to this important branch of dairying. The results of five years' competition show conclusively that great benefits are derived.

Each year the winners raise the standard per cow. In 1906 the year of the first competition the winner in the cheese factory class reported 6,512 lbs. per cow, while in 1910 the average per cow was 7,542 lbs. for six months. In the creamery class in 1908, 199.6 lbs. of milk fat per cow won, while in 1910 the winner averaged 225 lbs. of milk fat per cow for the same period. Another competition will be conducted during 1911 along similar lines as in 1910.—Frank Herns, Chief Dairy Instructor for Western Ontario.

The man who thinks he must have a fight with his cows every now and then, doesn't know much about cow nature. It is a good deal like what is in the hearts of other folks. One cross word leads to another. Scold and you will get hit in the ribs. Let everything be done decently and in order and the work will move along like the ticking of the clock.

How are the milk cans? Getting some rusty? Let them go and get new ones. Rusty cans are a bad thing from every possible standpoint.

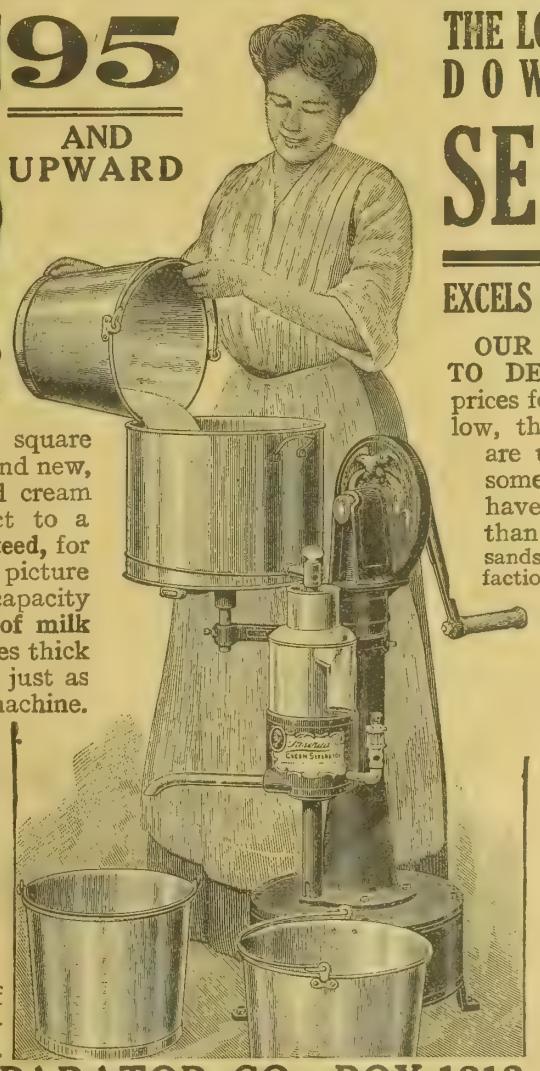
Plants that Grow.

Strawberries, many varieties, 75c per $1.00; $5.00 per 1,000 Raspberries and Blackberries, 50c per 12; $1 50 per 100 Other Small Fruits and Nursery Stock, Bees and Bee-Keepers' Supplies.

E. L. COLPITTS,
Box 10. Petitcodiac, N. B.

$15.95 AND UPWARD

THIS OFFER IS = NO CATCH =



It is a solid, fair and square proposition to furnish a brand new, well made and well finished cream separator complete, subject to a **long trial** and **fully guaranteed,** for $15.95. Different from this picture which illustrates our large capacity machines. Skims **1 quart of milk a minute,** hot or cold; makes thick or thin cream and does it just as well as any higher priced machine. Any boy or girl can run it sitting down. The crank is only 5 inches long. Just think of that! The bowl is a sanitary marvel, **easily cleaned,** and embodies all our latest improvements. Gears run in anti-friction bearings and thoroughly protected. Before you decide on a cream separator of any capacity whatever, obtain our $15.95 proposition.

THE LOW DOWN AMERICAN SEPARATOR

EXCELS ANY SEPARATOR IN THE WORLD

OUR LIBERAL TRIAL ENABLES YOU TO DEMONSTRATE THIS. While our prices for all capacities are astonishingly low, the quality is high. Our machines are up to date, well built and handsomely finished; run easier, skim closer, have a simpler bowl with fewer parts than any other cream separator. Thousands of machines in use giving splendid satisfaction. **Write for our 1911 catalog.** We will send it free, postpaid. It is richly illustrated, shows the machines in detail and tells all about the **American Separator.** Our surprisingly **liberal long time trial** proposition, **generous terms of purchase** and the low prices quoted will astonish you. We are the oldest exclusive manufacturers of hand separators in America and cannot afford to sell an article that is not absolutely first class. You save money by dealing with us and at the same time obtain the finest and highest quality machine on the market. Our own (manufacturer's) twenty-year guarantee protects you on every **American Separator.** We ship immediately. **Cream separators are admitted into Canada free of duty.** Write us and get our great offer and handsome free catalog. ADDRESS,

AMERICAN SEPARATOR CO., BOX 1212, BAINBRIDGE, N. Y.

Live Stock the Control of Bovine Tuberculosis.

The issue of the report of the International Commission on the Control of Bovine Tuberculosis is of significant interest at the present time particularly in view of the active public demand for some definite and authoritative pronouncement in consideration of the whole situation as regards Bovine Tuberculosis in its relation to the welfare of the live stock industry and to its influence on public health. The economic importance of the subject has occasioned a very great deal of discussion in scientific and agricultural circles and has led to the adoption by various legislative and municipal bodies of measures for the suppression and eradication of this great scourge of domesticated animals and for the protection of the people against infection through the consumption of diseased meat or polluted milk. It has long been felt, however, that for the North American Continent a really efficient and satisfactory program could only be arranged and undertaken with any prospect of uniform and permanent success through concerted action on the part of the governments of both the United States and Canada and only also when the legislation enacted or policy adopted was in substantial agreement with the expressed view of representative authorities of both countries.

The report referred to embodies the deliberate conclusions of just such an official and representative delegation and both farmers and the public generally are to be congratulated in having now placed before them in most concise and readable form a statement containing an epitome of the researches of the Commission and of the recommendations which it has at length determined to make. The decisions which have been reached are eminently conservative in their nature and for this reason, if for no other, they will exercise a much stronger appeal than would otherwise be possible, particularly in the case of those who may for any reason be prejudiced against legislative interference. The prevalence of the disease and the consequent loss to the breeders, as well as the now acknowledged danger to public health are not minimized but gravely acknowledged and seriously considered.

In the recommendations which have been made, however, due regard has been given to the great practical difficulties which must of necessity be encountered in the conscientious carrying out of any policy likely to be of use in combating the malady.

Compulsory slaughter of infected animals is not advocated though the destruction of those showing clinical symptoms of the disease is advised. Compulsory testing even is not insisted on, except in herds where the disease is known to exist, though the usefulness of tuberculin, as a reliable diagnostic agent, when properly administered, is confidently affirmed. The Commission bases its great hope of ultimate success in accomplishing the intention of whatever legislation may be enacted on the co-operation ol the breeders of live stock in the policy of rearing healthy herds by protecting the young from contagion of any sort. A sufficient explanation is given of the methods advocated and in order to safeguard the interests of those now possessing clean herds and of those making an honest effort to establish such herds, stringent precautionary measures are recommended regarding the shipment, sale and interchange of stock. The policy as presented is in every way reasonable and cannot but commend itself to any fair thinking man.

It is unnecessary to enter into a further discussion of the details of the report of the Commission, as a copy may be easily obtained by any reader. The fact that this report is likely to form the basis of a new policy shortly to be adopted by the Department of Agriculture at Ottawa should give its contents a special interest for Canadian owners of cattle and swine. The time is evidently ripe for such a departure and the Minister's hands will no doubt, be strengthened by the steadily growing sentiment on the part of the public in favor of such action. In the meantime and until a definite policy is announced, a careful study of this publication should be made by every farmer and breeder in the country. Whether or not it may be to his advantage to lay his plans forthwith, in accordance with the proposed scheme as therein outlined, will remain for him to decide, but the information which the report contains is of immediate practical value and should not be neglected. It may be obtained by addressing the Veterinary Director General, Department of Ageiculture, Ottawa, Ontario.

Warbles.

Editor Maritime Farmer:

I am writing you to say that I can prove that David Roberts is mistaken when he says in your issue of April 11th that warbles in cows' backs are caused by flies depositing nits on the limbs of cattle. He appears to derive this idea from the fact that this is how the bots find their way into the horse's stomach.

The way the warble gets into the cattle's backs is by the large warble fly striking the back of the cow with such force as to pierce the skin and deposit the egg or nit just inside the skin. This is done in the hot summer days and they remain thus until the following spring when they are grown large enough to work out and drop on the ground where, in a short time, they are winged and able to take up their parents' trade.

It is the pain caused by the fly piercing the skin which cause cows to gallop in such panic over the pasture and seek refuge in woods or water, where the warble fly will not follow, as they are very shy and only strike the cattle when they are in a clear field.

I saw a warble fly which was as large as a black hornet strike a cow on the back last summer, when I was about five yards from her, when she was standing by the fence with tail raised and breathing hard from running. She heard the fly coming before it struck her and when it did strike her she was starting to gallop. I saw the fly descending slowly until it struck her on the back which caused her to gallop the faster, but when it struck her it arose in the air and departed much faster than it descended.

My father told me that he was passing a cow that was lying on the roadside and a gadfly or warble fly struck her while he was passing. The pain causing the animal to jump to her feet and gallop swiftly away. I will give Mr. Roberts, or any man five dollars for each nit or egg from a warble fly which he will take off the legs or body of a cow. I would also like to ask Mr. Roberts why the cows run over the pasture in the hot weather? If the fly deposits the nits on the legs of the cows, what makes them run? The horse does not run when the bot fly deposits her eggs on his legs. I put pine tar and raw paint oil on the cow' backs, once a week and the fly will not deposit her eggs while any grease or oil or tar remians there.—John R. Marks, P. E. I.

The Cost of Producing Baby Beef.

The results of four years' experience in maintaining a herd of grade beef cows for producing baby beef have been published by the Michigan Experiment Station in Bulletin 261.

These feeding trials, which were continued from the fall of 1905 until the summer of 1909, were conducted to compare the relative profits of the two methods of handling an ordinary grade beef herd. In herd No. 1, which consisted of 10 grade cows, the calves were nursed by their dams and also received supplementary feed. After weaning they were finished and marketed as baby beeves at 18 months of age. In herd No. 2, also consisting of 10 grade cows, the calves were weaned at birth, raised on skimmilk and supplementary feed and finished and marketed with the other lot, their dams being milked.

Exercising the Bull.

For herd No. 1, the average cost of the feed per year for the cows suckling calves was $32.32, and that of the supplementary feed consumed by the baby beeves $34.65, making the average cost per head of the baby beeves $66.97. The average weight per head was 995 pounds, making the average cost for production per cwt. $6.73, and no other revenue was obtained from the cows. With herd No. 2 the average cost of the feed consumed by the baby beeves raised by the skimmilk method was $50.77 and their average weight per head 966 pounds, making the average cost of production per cwt. $5.24. In addition, the average value of butter and skimmilk produced by the cows was $61.12, and the average cost of their feed per head per year $33.84. This leaves a profit of $27.28 per head for the cows on the skimmilk lot and also a difference of $1.49 per cwt. from the baby beeves.

The average age at the time of marketing was 532 days for the suckled lot and 537 days for the skimmilkers. The quality of the baby beeves produced by the two methods was practically the same and the skimmilk lots brought the same prices as the suckled lot when put on the market.

Turnips for Sheep.

Professor T. Reginald Arkell, who has charge of the animal husbandry department of the New Hampshire State college, has just issued a very interesting and well prepared bulletin upon the feeding of sheep and lambs. It is the result of series of very careful experiments conducted by Professor Arkell to determine the relative values of clover hay and native hay in the feeding of sheep. The comparison worked out greatly in favor of the clover hay. Much of the matter of the bulletin is naturally of great interest to the sheep raisers. But the conclusion in regard to some experiments in feeding turnips to sheep is of interest to all those who keep the wool and mutton producers. It says:

"It can be conclusively stated from the results of this experiment, that turnips have a beneficial effect in economy on mutton production. There is, however, one danger with turnips and that lies in overfeeding or attempting to make them constitute the bulk of the ration. Turnips on account of their watery nature, are not in themselves a substantial food. When extravagantly fed, they are apt to render the ration too laxative and produce scouring. Besides, to pregnant ewes the heavy over feeding of turnips will not infrequently cause them to bring forth lambs that are flabby or weakly. Four pounds per day to a sheep, however, is a safe limit.

Mangels and sugar beets, although rather more palatable and sheep prefer them slightly to turnips, are for rams expressly unsuited, as they are conducive to the decomposition of calculi in the kidneys, bladder and urethral tract. These calculi are composed chiefly of calcium phosphate and irritative to the urinary organs and will frequently attain sufficient size to close completely the urethral tract, causing in consequence the certain death of the ram. Turnips apparently have no such ill effect.

To recapitulate, turnips reduce the cost of mutton production, aid in the digestion of the fibrous foods and keep the sheep in healthy and vigorous physical condition. They are a boom in the ration, inasmuch as they prevent constipation and many other resultant ills, which so frequently occur when sheep are changed from pasture to dry feed. It must, however, always be borne in mind that turnips should be supplied only as a supplementary feed to give to the winter ration the slightly laxative effect of pasture."

Fattening Pigs.

The following are the conclusions arrived at by an experiment in fattening pigs conducted at New Hampshire College Experiment Station with cornmeal, middlings and separator skim milk:

1. The pigs receiving cornmeal and separator milk were the most hearty feeders and made the best gains.

2. The cost per pound of gain was over two cents cheaper where skim milk was fed with cornmeal and middlings.

3. Cornmeal produced much better gains and at a cost of 2.93 cents cheaper than middlings.

4. During the entire experiment the barrows made the best gains.

C. B. Pidgeon's Latest Catalogue!

FOR MAIL ORDERS ONLY.

LARGE AND SELECT LIST TO CASH BUYERS

SATISFACTION GUARANTEED OR MONEY REFUNDED

What More Can We Do to Win Your Confidence?

THE purchasing power of this great store makes PIDGEON VALUES true to their purpose--saving money for you.

Securing for you your choice of the best that the market can offer and finally our obligation to treat you fairly.

Our ambition and energies are centred on being thorough in the fulfillment of our duties; may we have the supplying of your future needs, great or small, equally important to us, no matter where?

Give us the opportunity to prove that we can save you money on dependable Shoes and Clothing.

Why You Should Send Your Mail Orders to Us

OUR prices are lower than you can get same quality goods in your own locality.

In every case they are as low and in many cases lower than all other Mail Order Houses.

You can prove this by comparing our Catalogue Prices with Catalogue Prices of Upper Canadian Houses, or the prices quoted by your local merchants. Why not then deal with us, a Maritime Province Firm?

We deliver all goods Free of Charge on an order for $5.00 worth or over.

You need no longer figure out Postage, Express or Freight Rates on orders of $5.00 or over because the prices quoted in our Catalogue, when purchases to that amount are made, are what the goods will cost you at your nearest Station, Post Office or Steamboat Landing.

On all orders under $5.00 enclose 25 cents for Transportation Charges.

All goods will then reach you without any Freight, Mail or Express Charges, so that you get them just as cheap as if our immense store was situated next door to you in your own town, and orders are filled same day as received and reach you not more than two days later.

We Give Valuable Free Gifts with All Orders of $3.00 or Over

WE give these Free Gifts solely as an advertising feature.

We realize that goods, no matter how superior their quality, cannot be sold to-day unless advertised. Therefore, we have decided to place in the hands of the consumer, not only the best Shoes and Clothing, but also the best class of Premiums ever offered.

All of our Free Gifts shown in this book are valuable and useful.

In sending your order mention number of Gift wanted and we will enclose it with goods absolutely Free of Charge.

If you prefer to wait until you have purchased enough to claim one of the Better Gifts, just say so in your letter and we will send a Check showing amount of purchase. You may save these until you have enough to claim whatever Gift you prefer. Send them to us and we will forward the Gift you have selected absolutely Free of Charge.

This is the Most Liberal Offer Ever Made you by Any House.

OUR TERMS ARE: CASH WITH ORDER--ONE PRICE TO ALL

OUR GUARANTEE of goods, right or money refunded, assures you of getting trust-worthy goods.

Our system of delivery of all good ordered from us, guarantees you the lowest cost for dependable goods ever offered you.

OUR REFERENCE as to our Integrity, we offer you any branch of any Bank in the Maritime Provinces.

C. B. PIDGEON,

(Continued on next ten pages.)

OUR FREE GIFTS to all buyers we are sure will please you. It is a form of advertising where the customer gets the cost of advertising. It will appeal to all shrewd buyers.

Our enormous buying capacity enables us to offer you the newest goods at lowest prices.

GOODS RIGHT OR YOUR MONEY BACK

INSTRUCTIONS FOR BUYING BY MAIL.

I. Do not enclose Cash unless letter is registered. Send Express or Postal Orders if possible, if amount is under $1.00 send Postal Notes. Do not send stamps in large quantities.

2. Do not fail to give size or color of goods requiring same, and when ordering from samples, be sure to enclose same, marking each sample second or third choice.
(READ PARTICULARS "HOW TO MAKE OUT ORDER")

IMPORTANT

READ

BEFORE ORDERING

3. Check your extention and total your orders carefully. READ PARTICULARS "HOW TO MAKE OUT ORDERS."

4. When returning goods always write your name and address on outside of package and return the bill. Tell us the reason why goods are returned and what you want done. To get the benefit of free transportation goods must be returned within ten days after you receive them.

5. Always send your orders in from the same family, with the same name and initials, this will avoid sending more than one Catalogue to the one house.

HOW TO SEND MONEY

For small amounts use Postal Notes.
We strongly advise you to send by Express Money Order, Post Office Money Order or Postal Note, which can be procured at your Express Office or Post Office at a very small cost. This is absolutely safe, for if the letter is lost we can easily procure a duplicate. The charges are as follows on Express and Post Office Orders :

$5.00 and under	3c	Over $10.00 and up to $30.00	10c
Over $5.00 and up to $10.00	6c	Over $30.00 and up to $50.00	15c

Charges on Postal Notes are :

From 20c to 40c cost	1c	From $2.50 to $5.00 cost	3c
From 50c to $2.50 cost	2c	From $5.00 to $10.00 cost	5c

If it is not convenient to obtain any of the above, put money in an envelope, see that it is carefully sealed and be sure to have your postmaster register it. The cost for registration is 5c.

Do not send cash without registering. If letter is lost the Post Office cannot trace it and you will be at the loss.

We accept Bank Drafts and Marked Cheques payable at par in St. John, Canada.

HOW TO MAKE OUT ORDER

1. Be sure to give the Catalogue Number of article. Always state the amount of money you enclose.

2. Write distinctly. Use our order forms; if you have none plain paper will do. We supply order forms free on request. If plain paper is used follow the arrangement of our order form as nearly as possible.

3. Be sure to give your name and address, and always order under the same name and initials from the one family. This will save us sending more than one Catalogue to a family, and will keep our list correct. Advise us of any change in your address.

4. Be sure to give all sizes, colors or measurements, as without this information it is impossible for us to fill your order.

5. See that your name and address is correctly and plainly written.

6. If you wish your order shipped by Express or Freight fill in Order Form, under shipping instructions, your nearest Railway Station.

ENQUIRIES ABOUT ORDERS

Should you not receive your goods or hear from us within a reasonable time, write us giving full particulars, with copy of the order and if it has been received by us we will adjust promptly.

When writing us in reference to delay, advise us from what railway office you made the enquiry.

On receipt of goods if anything is wrong write us at once, giving us the order number and particulars. Our aim is always to satisfy our customers, and all we ask is the opportunity to do so if you are not satisfied.

All claims must be made within 10 days after receipt of goods.

We cannot enclose orders when received under separate covers. We cannot make any alterations on your original order, all information must be enclosed in one envelope.

We prepay to your nearest railway station.

We do not pay wharfage or insurance charges on Boat shipments.

In case of shipments going by Express or Freight and of which you have not received advice from your agent, make enquiries from the agent before writing us.

In case of shortage before writing us, be sure to examine the package carefully, and tell us the number of parcels or pieces received.

SUBSTITUTIONS AND OMISSIONS

If the goods you order are out of stock, we will, unless you tell us not to, send similar goods of better quality for price allowed, you having the privilege of returning the goods at our expense if they are not satisfactory.

When any of the goods you order are not in stock, and we will have them in a few days, we will ship your order short these goods with an explanation that they will be forwarded later, we pay any extra charges incurred.

RETURNING OR EXCHANGING GOODS

1. When returning goods write plainly your name and address on outside of package.

2. Tell us the reason why you are returning them and what you want done

3. Send parcels 1 lb. or under by Mail. From 1 to 20 lbs. will usually come cheaper by Express. Over 20 lbs. return by freight.

4. Write only one letter giving us instructions.

5. If goods are returned by Express, ENCLOSE THE BILL WITH INSTRUCTIONS IN PARCEL. If returned by freight enclose bill in shipment and write us by letter.

SENDING FOR SAMPLES

When sending for samples be sure to give the Catalogue Number of the material you require.
We will sample only goods that are catalogued.

We cannot send samples unless Catalogue Number of material or article is given.

Do not send for samples before you need them and, when received, order at once to avoid disappointment.

We do not sample bargain goods advertised in St. John daily papers.

To avoid the trouble and delay of sending for samples, if it is more satisfactory to you. "We will give you the benefit of our Liberal Guarantee." If the goods you order are not satisfactory, we will exchange or refund your money and pay all transportation charges.

WHEN ORDERING SAMPLES

If samples requested fails to reach you within a reasonable time, write again giving catalogue numbers and full particulars.

WE GUARANTEE SAFE DELIVERY OF GOODS.

On All Goods purchased from us, if same are not received by you within a reasonable time after ordering, advise us and we will duplicate your order and make shipment at once.

If Any Part of Your Shipment is Damaged when received, have your agent make notation on back of your freight express bill and send it to us with all particulars and we will make it right.

Customer's Protection. We want every man, woman and child who buys from us to receive the best possible service and treatment, and if you have any complaint whatsoever on the arrival of your goods, any delay, any damage, any shortage, or any faults of any kind bring them to our attention, and rest assured that they will be promptly and satisfactorily adjusted for you.

Every page from 545 to 555 inclusive, is taken up with Pidgeon values. You will find it to your advantage to look over my prices, compare them with what is offered by your local merchant and other mail order houses, then see what a great saving you can make by buying from me by mail.
Besides selling you first quality goods, at the cheapest price they can be possibly offered at, I will make you a present of any of the premiums you select, according to the amount of your purchase. Send me a trial order and send it to-day.

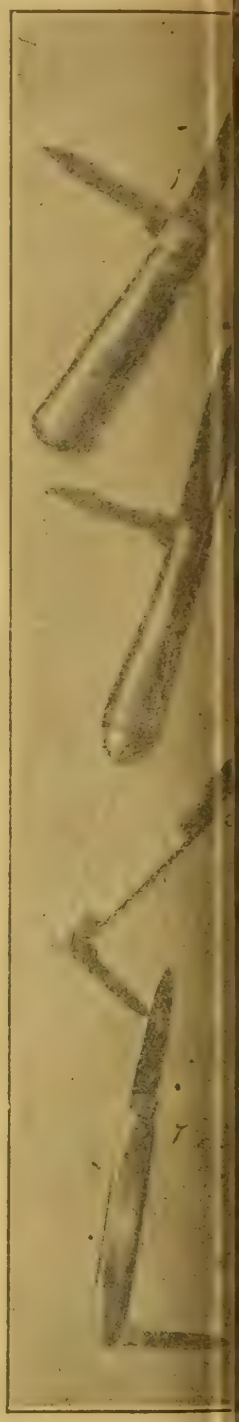
Your choice of these with $20.00 cash sales.



Your Choice of the

WHEN you have made up your order from our catalogue, the prices in which we are sure you will find interesting, don't forget to select the Gift which you prefer. We will enclose it in parcel and ask you to accept it with our compliments.

A good way to get our largest and best premiums is for 8 to 10 families to club their orders, say once a month, and then have one of the number order for all. When the premium comes, cast lots for first, second, third choice and so on, until each member has secured a premium. In this way a $20 order means only $2 each from 10 club members and a $10 order only $1 each. This will also prove a good test of our reliability.

WE would ask you to look over our prices carefully, compare them with prices offered by your Local Merchants and other Mail Order Houses. You will find our prices the lowest quoted for reliable goods and our Free Gifts an additional inducement to buy by mail from me.

We aim to make our Free Gifts useful articles which you will be using every day. We are sure you will be more than pleased to receive any of above gifts.

The Jewellery I offer is not trash, but good, reliable goods, which you will find ornamental as well as useful.

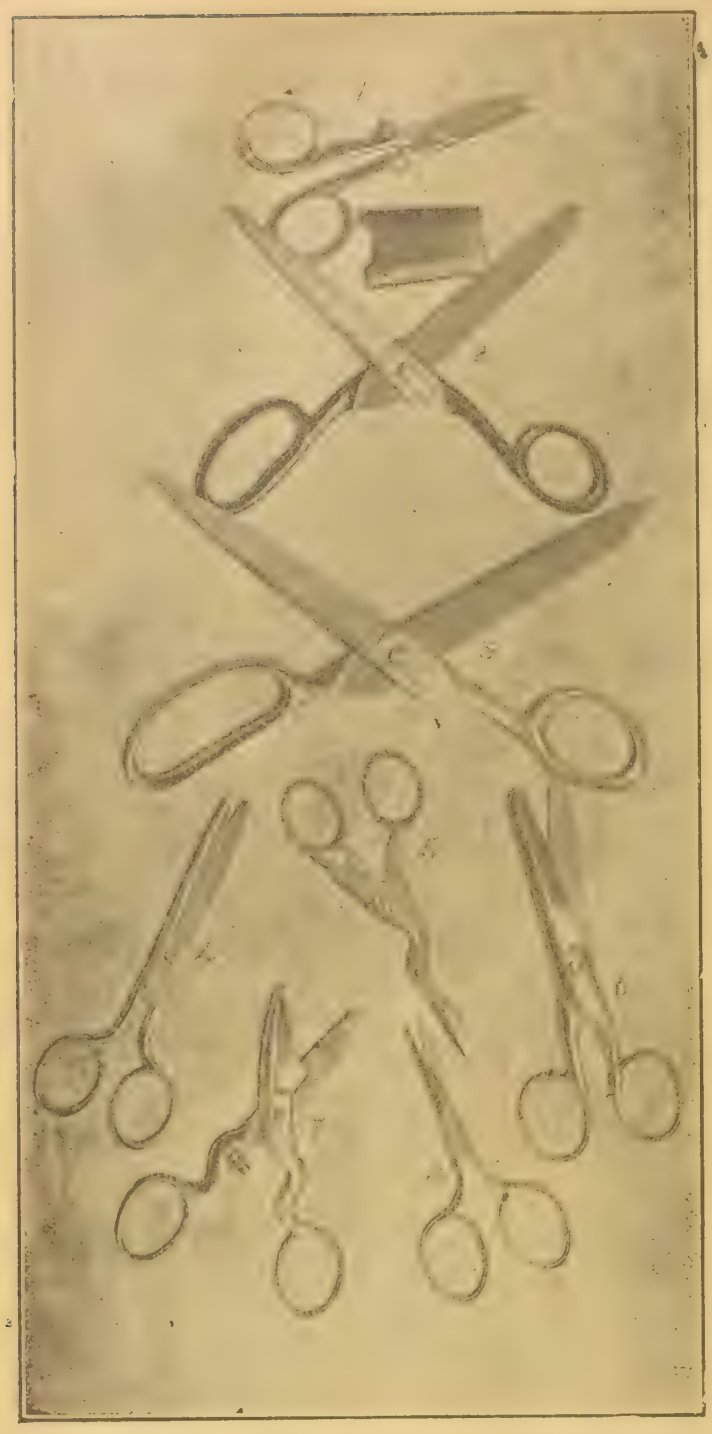
DGEON

ST. JOHN, N. B.

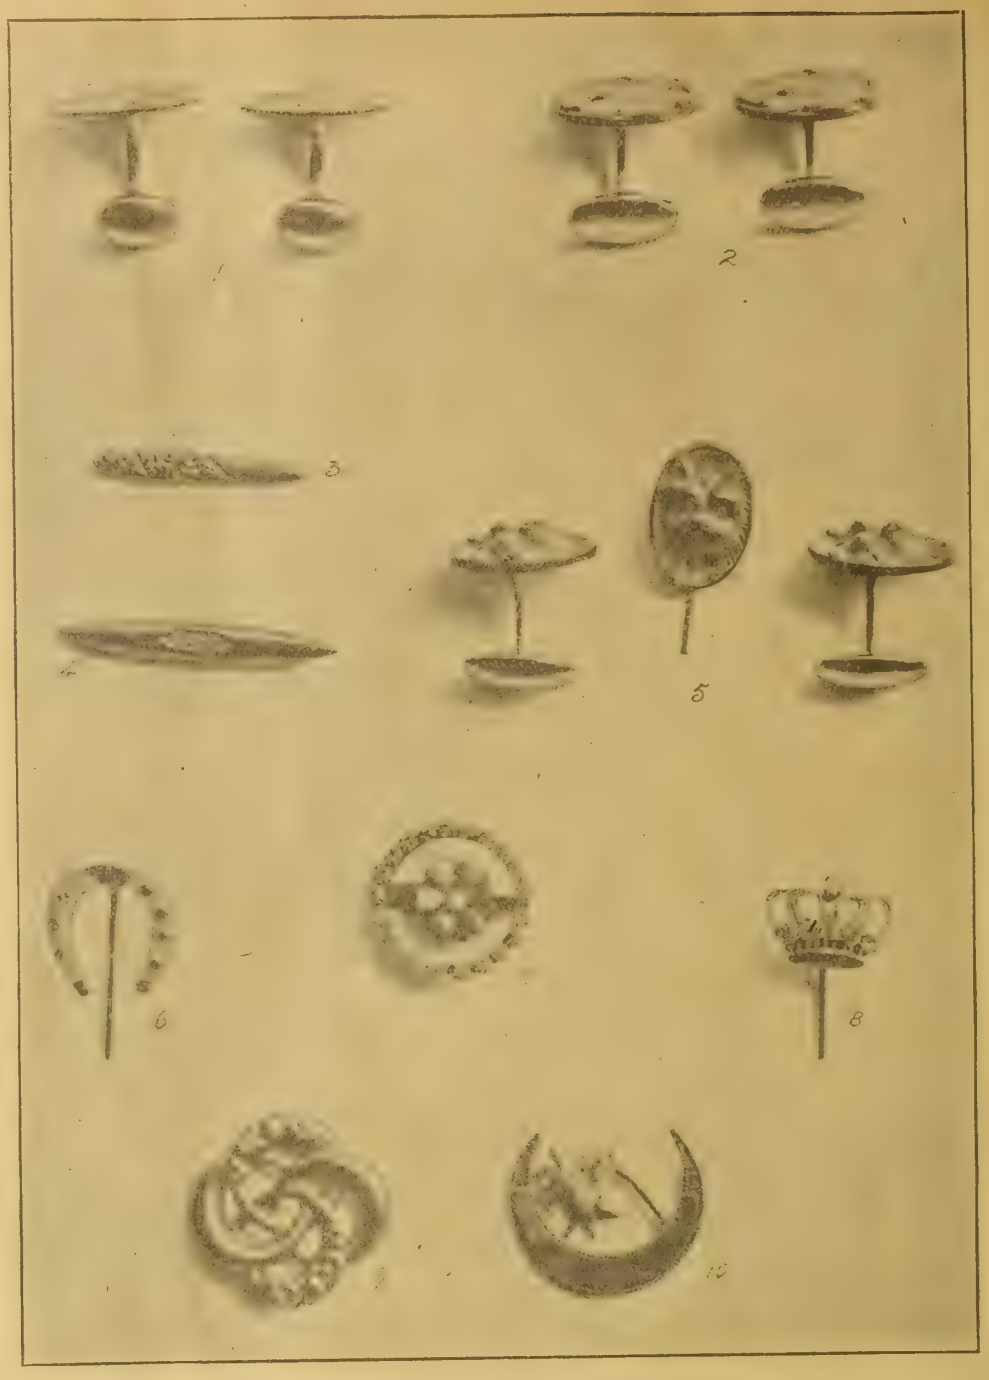
Our Mens, Womens, Boys, Girls, and Childrens Rubbers and Overshoes Described in this issue are made by reliable manufacturers and we can recommend them. The prices are the lowest quoted for reliable goods. But the quality is not affected—do not forget to state the size required. If you want these goods sent by mail the Postage Rate will be one cent per each ounce.

Every page from 545 to 555 inclusive, is taken up with Pidgeon values. You will find it to your advantage to look over my prices, compare them with what is offered by your local merchant and other mail order houses, then see what a great saving you can make by buying from me by mail. Besides selling you first quality goods, at the cheapest price they can be possibly offered at, I will make you a present of any of the premiums you select, according to the amount of your purchase. Send me a trial order and send it to-day.

Our guarantee of goods right or money refunded assures you of getting trust-worthy goods. Our enormous buying capacity enables us to offer you the newest goods at lowest prices. Our system of delivery of all goods ordered from us, guarantees you the lowest cost for dependable goods ever offered you.



Your choice of these Scissors with $3.00 cash sales.



Your choice of these valuable pieces of Jewellery with orders of $10.00 worth or more. The Jewellery I offer is not trash but good, reliable goods, which you will find ornamental as well as useful.

The Lawrence-Williams Co., Toronto, Ont.

THE HORSE.

Too Much Hay Fed to Horses.

Overfeeding with hay was one of the common faults to which Mr. Bright called attention. Especially when horses are idle are they likely to have their stomachs overloaded with hay that they cannot digest. The excess is wasted and is even a deteriment to the health of the animal. A horse can digest only a retain quantity, and anything more is a loss. It often happens that idle horses kept off full feed go wrong and serious illness, if not the loss of the horse may be the result. It is very important that horses be exercised every day. Bright, clean well-cured clover hay and oats, make a good balanced ration for the horse. Some men object to clover hay, but it is the best. The danger lies in feeding dusty hay. Bran and alfalfa are also good foods for the horse. Do not feed so much alfalfa as of red clover as it is a richer feed.

"I always feed salt with the oats given the horses," said Mr. Bright. "With new oats about one tablespoonful to the gallon with old oats not so much is necessary. Salt aids digestion."

Mr. Bright pointed out the value of black strap as an appetizer and aid to digestion. A prominent veterinary surgeon has said, "It is the best bowel antiseptic known to the profession, and if taken in time it is a sure cure for heaves." From one-half to two pints per day is the proper amount to feed. Watering before meals is preferable, if you can get the horse to drink then. Some horses won't and have to be watered afterwards. If a horse comes in hot, allow him only a fair swallow and wait till he cools off before giving him a full drink. Giving a horse all the cold water he wants when he is hot is very liable to cause founder.

Brood mares should be exercised every day, preferably at farm work, otherwise hitch them up and drive them three or four miles. It is a good practice to work them right up to foaling. Stronger and healthier foals will be the result. Do not give in-foal mares too much bulky food. It is a bad practice to let them run at the straw stacks as they fill themselves up and do not take exercise. Keep their muscles hard and do not let them get fat. A small thin foal which gets up quickly is better than a big flabby weak one. After foaling give the mare about three weeks' rest, then she can begin working again. Keep the foal in a box stall while its dam is working. It will soon learn to eat clover hay and crushed oats. A little oil is also good. If skimmilk is available, no better returns can be got for it than by giving it to the foal. When cared for in this way the foal can be weaned at three months old. Feed liberally after weaning choosing bone and muscle forming foods and give the colt plenty of exercise. A liberal use of the curry comb and brush also helps to keep their coats in good condition. The colt should be halter broken as young as possible and educated so that it will show to advantage before a prospective buyer.

As winter feed for a heavy draft brood mare. Mr. Bright said about 2 gals. oats and 2 gals. bran per day fed night and morning with straw at noon was about right. Mr. Bright said that Ontario was destined to become the breeding ground of North America. If we only take care in selecting our breeding stock and exercise the growing colts daily outside in order to strengthen their feet and pasterns.

The type of animal that is profitable to produce was described by Mr. Bright in his talk to the judging class. In beef cattle we shoul look for a short broad, head, a large nostril, a bright, clear, prominent eye, a wide muscular jaw. These usually indicate strong constitution and good feeding qualities. The neck should be short and blend into the shoulder nicely. The shoulder should be smooth and well covered with flesh. The back should be broad with the width carried right back to the rump. The ribs should be well sprung and of good length. The legs should be short and straight and well set under the body. A large heart girth is very desirable as this means a strong constitution. The flesh on the hind legs should be well carried down to the hock. The skin should be loose and well covered with fine silky hair. In raising heifer calves of the beef type, to develop their milking qualities they should not be allowed to suck the cow. Bring them up on skimmilk and feed them foods which will develop bone and muscle but do not ,et them get fat, said Mr. Bright.

The demand for heavy horses which are sound and of good quality is far greater than the supply. The horse wanted is one of quality with all the weight possible. Good underpruning is essential, as strong feet and legs of the right conformation are very important. The head should be wide between the eyes and not too long, having a large nostril and a wide well muscled jaw. The head should join the neck neatly. The neck should be arched slightly, of fair length, well muscled and blend nicely into the shoulder. The shoulder should be sloping and the leg well muscled down to the knee. Below the knee and hock the leg should be clean. The back and loin should be wide, the rib well sprung and long giving plenty of room for the heart and lungs and organs of digestion. The rump should be wide, fairly long, well muscled. The back broad, deep and clean, the pastern sloping and the feet strong and set straight.

The Horse's Feet.

The teeth and the feet of the horse should receive special attention, for without these in a good healthy condition the animal's usefulness is in a large measure destroyed.

The colt should have its feet cared for as closely as the matured animal, in order that he may grow to maturity with feet in a healthy condition. The foot of the colt will often project far below the sole and cause it to split and form quarter and toe cracks. It is better to use a pair of hoof cutters and rasp, and have the feet pared evenly and avoid unbalancing the animal.

Any horse used on the road or street should be shod, but the shoes ought to be changed every five or six weeks and the feet trimmed, in order that the natural growth of the wall may be removed. If the shoes are improperly allowed to remain on the feet for two, three or four months and in some cases a year, without changing them, the wall becomes excessively long and grows over the shoe. Pressure becomes too great on the sole and bars, resulting in corns, bruised soles and lameness.

A hoof hook should be included among the equipment of a well-regulated stable. The feet of the horse hould be cleaned every morning before he leaves the stable. The hoof hook will remove all litter, pebbles, or anything that may have become lodged in the foot. This precaution may prevent injury to the sole or sensitive structures of the foot. If the feet become very dry, pack them daily for a week with some form of clay. They apply lard to the wall, to which may be added pine tar and rosin. This ointment holds the moisture in the feet and prevents further evaporation.—C. L. Barnes, in University News.

Curing Stall Habits.

To cure a horse of halter breaking tie one end of a long rope to the manger, pass it through the halter ring, between the forelegs and up over the back, then down the other side, between the forelegs again and up through the ring to the other end and there tie to the halter. When the horse pulls back, the force is on his own back and he will soon stop the habit. Do not let the rope hang loosely enough for him to get his legs over it.

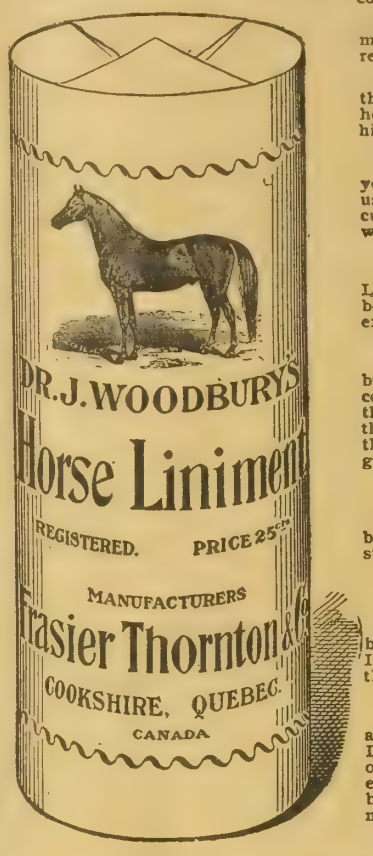
Pawing in the stall, and throwing the bedding back, can be cured by nailing a one-inch to three-inch cleat on the floor back of the manger, and another one eighteen inches to two feet further back. In pawing, the horse's hoof is drawn over these cleats, and he is soon broken of the habit when the cleats can be removed.

DR. J. WOODBURY'S Horse Liniment.

INFALLIBLY THE REMEDY.

For the removal of Splints, Bog Spavins, Enlargements of any and every description it has no equal. Given internally, it will promptly relieve and remove any and every character of Cough, Enlargements of the Glands, Affections of the Kidneys. For Distemper, Strangles and Colic it is infallibly the remedy.

All horses that are stabled should have an applicatiou of Dr. J. Woodbury's Horse Liniment to the hoofs of the fore feet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured.



Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions.

Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.

Dear Sirs :—We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it. Yours truly, CLARKE BROS.

Hubbard's Cove, N. S.

Dear Sirs :—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use. Yours truly, C. C. McLEAN.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung diseases. It is the best thing to give horses in the spring to keep them in condition It purifies the blood, cleanses the lungs from impurities, which may exist, and gives the system healthy action.

NEWTON LEE, Owner "All Right " 5817.

Elmsdale, N. S.

Dear Sirs :—Kindly send me 6 dozen Dr. J. Woodbury's Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take.

Yours truly,
ELMSDALE MERCANTILE CO.,
Elmsdale, N. S.

Dear Sirs :—I cured my horse with Dr. J. Woodbury's Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly,
H. R. WHITEHEAD.

Dear Sirs :—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months' standing. In my large experience with horses, I consider this liniment to be the best made for all diseases in the horse, and I recommend it to my friends.

THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Love's Barrier.

CHAPTER I.

IN THE LUXEMBOURG GARDENS.

It was the beginging of the third and last week of Secretan's holiday and as he passed through the gates of the Luxembourg Gardens he was quite conscious of a feeling of sharp regret, even of reluctance, at the prospect of returning to England and taking up the routine of his life.

It was his first visit to Paris, and he had enjoyed it to the full. Disappointed at the last moment in the college friend who had agreed to share the long-planned holiday, he had managed alone to obtain full value for his money, and looking back across the two weeks, could not recall one ill-spent day.

A student of history and of human life, modern Paris had interested him no less than the old city about which such glamour hangs.

His knowledge of French being sufficient to permit conversation with the men and women he encountered daily, he had from choice kept out of the beaten tourist tracks, and had engaged a modest lodging at a purely French hotel in the heart of old Paris, in a little house well known to the denizens of the Latin Quarter in their palmier days. And there he had lived a life so entirely different from the usual routine that sometimes he was tempted to ask whether he was actually Claude Secretan, priest in holy orders, Rector of Midcar, a windswept parish up on the Yorkshire moors.

Secretan was poor man, possessed of no means beyond his meagre living, and he had planned and saved for this holiday for the past two years. It had been rendered immediately possible, however, by the unexpected acceptance of some papers he had written about his moorland parish, and he blessed the inspiration of his usually unimaginative sister Jane, who had urged him to set his impressions down, and had taken upon herself the task of correcting and making them ready for the press. She had even sought and found a market for them, and the outcome of her endeavors was a cheque for twenty pounds and a request for further articles. Secretan was now planning a series of papers on his Parisian experiences, forgetful of the fact that the ground had been already trodden by countless feet, whereas his own parish was virgin soil, the types to be met there individual and apart. 6

He had spent the morning in the Cluny Museum, and now sought a breath of purer air before returning to the Restaurant Amedee for his mid-day meal. It was a morning in the late September, and though the leaves were changing hue on the noble trees, the air was as soft and balmy as a Yorkshire mid-summer. For the first time in seven years Secretan had escaped the bitter winds which from September to the end of October often swept the moorlands and were a sore trial to delicate folks.

Secretan himself was a strong man and carried his six feet of well-knit manhood with vigor and grace. His thin, ascetic face was tanned and healthy, his eye keen and clear. The quick glance indicated an eager, perhaps hasty, temperament, generous, yet impulsive to a degree.

Secretan had no idea what a gentle yet effective restraining influence his sister's sterling common sense and even temper had upon him, or how much of his undoubted success in Midcar was due to her.

He had made mistakes, some of them rash ones, but Jane had never failed to step into the breach; she had indeed well oiled the machinery of his life, while appearing to be nothing more than an amiable housekeeper and a prudent woman, not much given to unnecessary speech.

Very few guessed that Jane Secretan was in reality the power behind the throne. She had been accustomed to stand aside all her life so that her brother might push on. In their poor home everything had been made subservient to the furtherance of Claude's career. Thus there had been engendered in him a species of fine selfishness of which he was himself unconscious. He accepted sacrifice and service as a matter of course; always graciously and amiably it must be said, but imperturbably, as if they were his by right. His mind had been very easy during his Paris holiday, because Jane had been left at the helm, to keep the curate-in-charge up to the mark.

It had not occurred to him that Jane either needed or desired such a holiday for herself.

Secretan did not wear the distinctive dress of his order when off duty; a suit of fine blue serge, a flannel shirt, with a neat linen collar and black tie, and a soft felt hat gave him the appearance of an ordinary travelling Englishman of the better class. He was intensely fond of children, and often strolled into the the gardens of the Luxembourg for sole purpose of watching them at their play, especially the amateur yachtmen who peopled the banks of the pond, where they spent many tireless hours.

As Secretan approached the pond that Monday morning he beheld what appeared to be a small fracas among the children, and, stepping forward, discovered a small English boy, about nine, in a perfect fury of passon, because his boat, a beautiful miniature yacht, had got entangled in mid-stream with some sister craft. He was in tears, and, stamping his foot, ordered a very English-looking lady, who appeared to be in charge of him and his sister, to rescue his boat for him instantly.

"I can't, Geoffrey," she explained in a sweet, clear, but quite decided voice. "Don't you see it is quite qeyond the point of my sunshade? We must find the man with the long pole. Perhaps he has gone for dejeuner."

Secretan immediately stepped forward, slightly raising his hat.

"Pray allow me, madam. I think I can reach your little boy's boat. I happen to have a very long arm and a good stick. At least I can try."

The lady uttered a word of hasty thanks, her color rising slightly as the knowledgement that her somewhat sharp words to the child had been overheard by one who understood them. A small crowd swiftly gathered to watch the tall Englishman's effort to disentangle the boats and very soon he was rewarded by bringing them safely to shore without so much as a cord damaged.

The English boy immediately grabbed his boat and at the same time ave the Frenchman's a contemptuous kick with his foot.

"You get your rotten hulk messed up with my boat again, Froggie, and I'll punch your head. See if I don't' he said, squaring his shoulders at him in regular John Bull fashion.

At this the little girl laughed shrilly, but the governess or mother, looking very angry indeed, sharply rebuked them both.

Secretan merely smiled.

"'Your little charge has not yet grasped the meaning of the entente cordiale, and happily the little Froggie did not understand a word."

"Geoffrey is a little cad, and wants a good whipping," she replied with asperity. "The whipping I should very much enjoy giving him."

Somehow the words spoken with such hard vindictiveness repelled Secretan, though his admiration for the graceful woman with the sweet, high-bred English face inreased as he watched her more closely.

"Most British boys pass throngh the cub stage. When he goes to school it will be licked out of him, never fear."

"I sincerely hope so. I'm sorry you heard me speak so emphatically, but I have had a very trying morning. I had to bring them first of all from the other side of the Champs

MORE PINKHAM CURES

Added to the Long List due to This Famous Remedy.

Glanford Station, Ont.—"I have taken Lydia E. Pinkham's Vegetable Compound for years and never found any medicine to compare with it. I had ulcers and falling of the uterus, and doctors did me no good. I suffered dreadfully until I began taking your medicine. It has also helped other women to whom I have recommended it."—Mrs. Henry Clark, Glanford Station, Ontario.

Another Cure

Harvey Bank, N. B.—I can highly recommend Lydia E. Pinkham's Vegetable Compound to any suffering woman. I have taken it for female weakness and painful menstruation and it cured me. — Mrs. DeVere Barbour.

Because your case is a difficult one, doctors having done you no good, do not continue to suffer without giving Lydia E. Pinkham's Vegetable Compound a trial. It surely has cured many cases of female ills, such as inflammation, ulceration, displacements, fibroid tumors, irregularities, periodic pains, backache, that bearing-down feeling, indigestion, dizziness, and nervous prostration. It costs but a trifle to try it, and the result is worth millions to many suffering women.

If you want special advice write for it to Mrs. Pinkham, Lynn, Mass. It is free and always helpful.

THE ENERGY FOOD

The Vim and Vitality One Gets From Oats

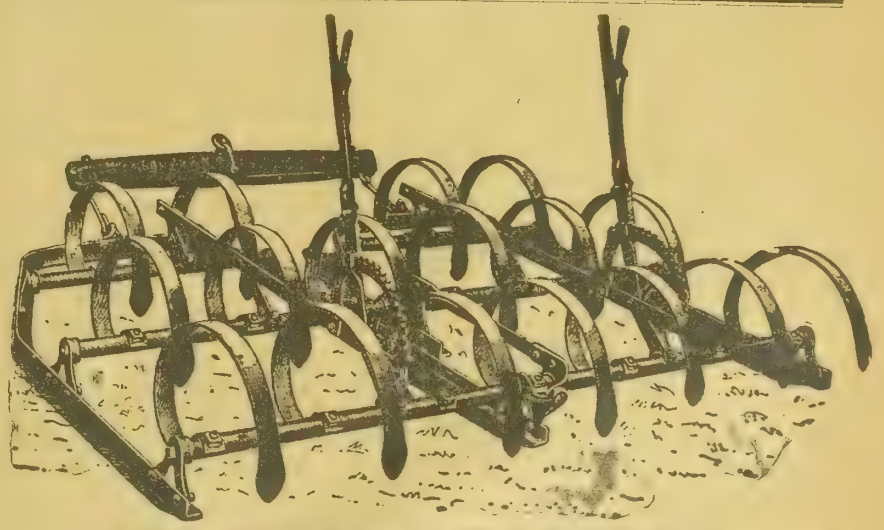
There is something in oats which creates spirit and energy. No other grain can bring results like them. Everyone knows what oats do for horses. They have the same effect on man.

An extract of oats is employed as a tonic. A diet of oats multiplies one's vitality. That's why energetic men—men of vim and spirit—are said to "feel their oats."

In Quaker Oats the finest oats—Canadian grown—are subjected to 62 siftings. Just the rich, plump grains are used. There is only ten pounds of Quaker Oats in a bushel.

These grains have the maximum of richness and energy. They are also the most delicious. To eat Quaker Oats once a day for a month will show to the limit what tonic effects, what bubbling vitality one can get from oatmeal. One never knows how good oat food is, or what it can do, until he tries Quaker Oats.

Made in Canada. (169)



HARROWS.

THE HIND WITH LEVERS.

Last week 'twas farmer Smith's story. This week its farmer Stevens. He's been using this kind these two years. Says its great because it doesn't jump; just "gets there" steady right along. Then he changes the depth every scrape and as soil gets looser he gets down deeper, without hurting the team.

Saves labor—which costs these days,—because it harrows more effectively and therefore more quickly,—less scrapes do.

Dumps weeds with Levers.

Made with 9, 11, 15 and 17 Teeth.

Elysees on that gastly Metropolitan."

"Yet I seem to remember a nearer pond, in the Tuileries Gardens?" said Secretan inquiringly.

"Oh, yes, but it will not serve them. I have to come here every day. It is lovely when we get to it, but there is always the going back. Don't you think it very hot for September?"

"I like it. I come from a bleak moorland parish, and the glow and softness of Paris appeal to me irresistibly."

KINNEAR POULTRY CO., LTD.
SUSSEX, N. B.

We have now mated for this season's hatching twenty pens of specially selected utility R. I. Reds and B. P. Rocks for best market and laying stock. Eggs $3.50 per 100. Eggs from pens of birds mated for Exhibition stock, $1.00 per 13.

We will have some choice Cockerels from our breeding pens this month, at reasonable prices. Good chance to get one for next season.

"You don't know Paris very well, then? Perhaps it is your first visit?"

"It is. May I sit down for a few moments and talk?" asked Secretan eagerly. "You are the first English person I have spoken with since I arrived a fortnight ago."

"How extraordinary! The place is chock-full of them! Yesterday five vanloads of them drove down the Champs Elysees, some of them waving small Union Jacks. It is a wonder," she added, with a little cold snap in her vkice, "that they were not shouting 'Rule, Britannia,' at the top of their voices."

"I expect, if they had, it would merely have indicated a hilarious state of enjoyment. May I ask whether you live in Paris all the year round?"

He had already decided that she was an English governess, and that she did not care for her post. But her answer, given without the slightest hesitation, disposed of his hazard at once.

"I live in Colchester. These children are my half-brother and sister—which accounts," she added swiftly, "for my sad lack of patience with them."

"They are handsome children," remarked Secretan, glancing with a freshened interest at the children to see whether they in any way resembled her.

"When I was a child, my old nurse was fond of the proverb, 'Andsome is as 'anesome does! These two have been spoiled by a silly mother. I do my best, but I have no real hold over them, because she does not uphold my authority."

"Is their mother in Paris also?"

"Yes, we are living in a pension in the Rue Nassau, off the Champs Elysees. It is very small, and very full, and it is necessary to keep the children almost entirely out of doors. The duty falls to me. I'm afraid I don't accept it gracefully."

Secretan looked less sympathetic, and she immediately observed the slight alteration in his expression.

"You think I'm a beast," she said hardly. "Doubtless you are a happy father yourself, and think the child can do no wrong. That is the modern idea of parentage."

Secretan threw back his head and laughed, with a heartiness which surprised himself and compelled Helen to join him.

"I have not the felicity to be married," he said at last, and somehow both immediately felt more at ease.

"Tell me how you like Paris," she said interestedly.

"I am under its lure," he answered regretfully. "I awoke this morning overshadowed by the knowledge that I had started on the last week. I have to return to England on Friday in time for my services on Sunday."

"Your services? Then you are a clergyman?"

"I am. My name is Secretan, and my living is at Midcar, in Yorkshire."

"I understand why my exhibition of temper shocked you," she said, and Secretan imagined that she slightly drew herself farther back on the seat. "But how is it that you don't wear the cloth?"

"I discarded it for convenience and economy," he answered simply. "I am a poor man."

"I beg your pardon," she said hastily, and with a sudden sweet, appealing smile which altered the whole expression of her face. "It is my misfortune to say the wrong thing. I have been saying it ever since I can remember."

"There is nothing to forgive," he assured her, and seemed to watch with a fresh interest the children at their play. All their little grievances forgotten, they were collaborating amicably once more.

"The little breeze has passed," observed Secretan with a smile. "How quickly the child forgets!"

"And forgives. Yes, there is nothing mean about Geoffrey. If only his father had lived, one would have had

ALFALFA SEED . . FREE

WE want farmers in the Maritime Provinces to become better acquainted with us and our seeds. We use the utmost care in selecting our seeds, but unless you give them a trial you will probably never know what you are missing in not getting them direct from us. With a view to our getting in touch with each other—to both our mutual advantage—we are going to offer, for a limited time, a one-half pound package of Alfalfa Seed absolutely free—one package only in a family—to each and every farmer who sends for our seed catalogue. Sending for catalogue does not in any way bind you to buy from us. Write to-day and get one-half pound Alfalfa seed free.

Geo. Keith & Sons,
124 King St., E. Toronto, Ont.
Established 1866.
This offer is not binding unless you mention the Maritime Farmer when writing.

hope of him," she said, and her face softened yet more tenderly and drew Secretan's eyes like a magnet.

He had always lived in an atmosphere of feminine mildness; he had been the spoiled darling of his mother, and was now mothered a little less demonstratively, but quite as thoroughly, by his sister. His feminine ideal embodied surrender, patience, almost complete self-effacement.

The strength and bitterness with which his new acquaintance spoke interested him greatly. He wished it were possible to know more of her.

"You know Paris well, I suppose? Your French had nothing English about it when I heard you speak to the children a few moments ago."

"I was educated in a convent at Charenton. Do you know Charenton?"

"I went there by boat on one of the fine mornings. But you are not of the Catholic faith?"

"No; I was sent to Charenton for cheapness."

"Perhaps you can set my mind at rest regarding the convent system of education for Protestant English girls. I heard it discussed at a dinner-table a week or two before I left Midcar. Was there any attempt at proselytising?"

"None whatever, except that the example and the peace was alluring. I was very happy there. I don't think I have ever been quite so happy anywhere since. Perhaps one day I shall go back."

"It would be a false peace," he said with a sudden hardness in his voice which surprised her. "That is the real lure of Rome, to appeal to all the sense, until one is wholly subjugated."

"How passionately you protest! Have they tried to proselytise you, then?"

Secretan laughed.

"Certainly not, but it is a subject on which I happen to feel a little strongly, and I don't think that English parents are sufficiently alive to the danger of the convent system."

"Oh, I am sure it is non-existent. The poor dear little sisters of the Sacre Coeur! How very mildly surprised they would be if they heard you! If I had ten daughters, I should be very happy to send them all to Charenton. Well, I must collect my charges and pilot them to the nearest Metropolitan. We are supposed to lunch at a quarter to one, and it is after twelve now."

"Are you remaining long in Paris?" asked Secretan, rising very reluctantly.

"We never know. It all depends on Mrs. Revell."

"Mrs. Revell! Then you are Miss Revell?" he said eagerly.

"Yes, and my Christian name is Helen."

"Is there a chance that we may meet again?" he said, with the same eagerness.

"Oh, perhaps, stranger things have happened, Mr. Secretan. Midcar did you say?"

"Yes, Midcar, about eleven miles from Bradfield."

"I don't know those parts, and do you live with your mother? Somehow you look like a mother's son."

Secretan did not know whether to take the remark as a compliment or the reverse. He fancied her eyes a little mocking.

"My only sister keeps house for me. We are orphans. She is very good to me. It was she who made this incomparable holiday possible."

"One of the model sisters! I have never had a sister. Of course that child Margot can never be one to me. I dislike her mother too much."

"But perhaps she makes your father happy," suggested Secretan, who intensely disliked in her the vindictive mood.

"No, she made him wretched, and he is dead," she answered quickly, then turned quickly away from him with a little distant bow. "Geoffrey and Margot come at once! It is time to go.

(Continued next issue.)

Shoeing Horses.

Fit the shoe on the foot, not the foot on the shoe.

Do not ask the horse to carry around too heavy shoes. It is a waste of energy. Frequently light shoes are just as good.

Always be patient and gentle when shoeing the colt for the first time. Get the blacksmith to come and shoe it in its own stall if necessary. Most of the "hard shoers" learned their bad habits in their first visit to the blacksmith.

Ask your blacksmith to use a small nail. Large nails wear out the hoof and do not hold the shoe any firmer.

If your driving horse starts to interfere perhaps you had better change your blacksmith.

The principle part of every meal should be good Homemade Bread — made of "Beaver" Flour

There is more health and strength—more energy—more real food value—in good homemade bread, than in any other one article of diet.

Bread is the only food that alone will support life for any length of time. Good Home-made bread—made of "Beaver" Flour is the least expensive food—is the only food you can relish and enjoy three times a day, year in and year out—the only food that agrees with everybody and does everybody good.

The more bread you eat, the less will be your cost of living, and the more you will live healthfully.

The whole problem of economical living is solved when you eat more bread—wholesome, nutritious, delicious bread—made of "Beaver" Flour. Your grocer will supply it.

Why Every Breeder Should Have a Typewriter.

After working hard all day in the stable, the field and in the woods, the average breeder goes home at night to find mail waiting him that demands prompt attention. Your hands are naturally calloused and you would rather handle a pitchfork than a pen. If you had a Typewriter you would find it much easier to manipulate. The key board, showing letters plainly, is very simple. It may take a little longer at first to write your letters, but you can "speed up" with little practice. Then again, a Typewriter is better in a home where there are growing children, especially girls, than a piano. If they learn to operate it will not take nearly so long for them to get through business college if they know the use of a Typewriter. Right here is where you will probably save the cost of a machine. They last a lifetime with care and the fact that your correspondence is written on a Typewriter will give give you a standing with prospective buyers that cannot be obtained in any other way. We have lots of new machines ready to ship and have several second hand ones that have been rebuilt. If you are interested write for further information with regard to cost, etc., mentioning The Maritime Farmer.

The order for the china for the Chateau Laurier, the new Grand Trunk Hotel at Ottawa, has been awarded to the Theodore Haviland Company, of Limoges, France. This china is of a very handsome and unique pattern, and will be the best that can be turned out by this well known company, and includes regular servic, banquet service, Palm Room or Tea Room service and a De Lux set for use in the Royal Suite.

In connection with their exhibit the Grand Trunk Railway System are installing at the Festival of Empire, London, an oil painting they have had executed by a prominent artist, of a portion of the city of Ottawa showing the Parliament Buildings, the Ottawa River and Laurentian Hills in the distance, the "Chateau Laurier," the Grand Trunk's magnificient hotel, the new Grank Trunk station and the northern section of the city.

Those who have seen the picture have expressed gratification on the true portrayal of the subject and the artistic execution of the work. The picture went forward to London via the S. S. Celtic on Saturday, April 15th, and will no doubt be an attractive feature in the Grank Trunk building at the Festival of Empire The picture is five feet by seven feet with a 12 inch gold moulding of special design.

A Mother of Six.

(Continued from last issue.)

So, patiently and conscientiously she studied each picture. "Well, I'll know what to do with the hands after this," she meditated. "I could of made poor Emma Gentry's hands look three sizes smaller than I did. I allers thought she kind laid that last picture I took of her up against me; I believe I'll give her another sittin' when I go back. I'll know a heap more than I did anyway. Of course, the children will be disappointed not to see the pretty medal; but when I explain that what I learned will perhaps do me almost as much good, I think that will comfort 'em. I'll tell 'em Mammy did her best."

She was down at the hall in the mornings before the porter had finished sweeping out, and he invariably shut the fringe of her cape in the door when he locked up on her heels at night. During the demonstrations, she held her ground at the operator's elbow—nay, at his finger tips—and watched every manipulation of the paper as though her life depended on it.

The artistic beauty of the photographs, the sumptuous draperies, the suburb forms and faces, touched her, esthetically, not at all; she saw in them only the food, shelter and raiment for her helpless brood, could she but master the baffling mysteries of their art. All that she heard all that she saw, was put into the crucible of her mother's heart and subjected there to one supreme test its power to promote the well being of her children. With other photographers she fell into a sympathetic, professional acquaintance; and when, at the end of the convention, she sank into a chair on the edge of the crowd gathered to hear the announcement of the prizes, she felt that, after all, she had gained much by coming.

"As you doubtless understand, ladies and gentlemen," the president was saying, "there are two prizes offered in each class. The grand prize, first class, a silver loving cup, goes to Mr. Atwood." Everybody applauded. "Ah, —h—h!" breathed Mrs. Terwilliger," ain't it beautiful!"

"The second prize, first class, a medal, goes to Mr. Cassaday." Again came the aphlause, Mrs. Tewilliger leading. "Ain't he a happy man?" she said to herself.

"For the genre class, the first prize, this figure in bronze, was won by Mr. Kiteredge."

"Well, if that ain't good!" said Mrs. Tewilliger, bringing her hands together. "He was telling me how anxious his wife was for him to git a prize and won't she jest be proud!"

"Second prize, genre class, a medal the McCormick brothers."

"I will try and explain it to the children," she murmured.

"Class third, art lighting, this beautiful clock, was won by Mr. Elkes."—"Well, I'm so glad he got that prize! Been burned out twice, he said, and had a hard time."

"Second prize, medal, Mr. Hunter." Mrs. Tewilliger's hands came together automatically after each announcement, and her face beamed in sympathy with the fortunate ones.

"Minature class, first prize, gold medal, Mr. Watts."

"How thankful he must be for his children's sake—"

"Second prize, silver medal, Mrs. Tewilliger."

Through the mist that suddenly filled her eyes, she saw the faces turned toward her; and heard, but dizzily, the sound of generous applause. And she never knew that there happened to be but two entries in that class.

Think of it! Over 2,000 miles of this fencing is already in use on the farms and along the highways of Canada and in Foreign Countries, and every foot of it is giving good service. All the good points in every kind of Fence are incorporated in the manufacture of

Stationary and Mounted, in 1 1-2 to 30 Horse Power

Want Quality!

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of sealing directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylind e head. so that when the valves become worn, the valve cage and valve can be taken ou and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

THE TIE THAT BINDS 17

POULTRY.

Canada Wants Commissioners.

A large delegation of poultrymen waited on Hon. Sydney Fisher last summer and asked for a poultry commissioner for Canada.

The various recommendations made were:

1. In view of the fact that the supply of poultry products does not meet the demand a nd that so much of this produce, on account of the poor market conditions, is lost, we ask that a poultry commissioner be appointed, his duties being to study the question from a national standpoint, taking up such questions as markets, standards, diseases and kindred subjects. We also suggest that a conference be held at least once a year, to which the provincial poultry experts be invited. This would obviate overlapping and ensure national provincial co-operation.

2. Knowing that one of the greatest hindrances to poultry development is the inability to successfully renew the flock, due to the diseases of which poultrymen know very little, also that this loss amounts to probably millions of dollars annually, we ask that there be established in this department and under the direction of the poultry commissioner a department of scientific research along the lines of poultry diseases, etc., and that scientifically trained men be appointed to take charge of the work. For the advancement of this work a poultry plant will be necessary, which should be sufficiently large to encounter commercial difficulties.

3. Since the standardization of poultry products and co-operation in marketing—work which is of a national character—have already been introduced by the Poultry Producers' Association, it is asked that the department of agriculture assume the expense of this work, the association to remain, as at present, an independent organization with its own elected officers, as is the case with the Seed Growers' Association. It is further recommended that the commissioner publish a bulletin dealing with the care and handling of eggs and poultry and the marketing of the same. This bulletin should include the classification and standards of poultry produce as recommended by the Poultry Producers' Association.

4. Since many of the provinces are now operating poultry departments of their own, where experiments of a local character are conducted, and whereas the present poultry plant at the experimental farm, Ottawa, is inadequate and out of date, it is the opinion of this meeting that the interests of the poultry industry would be best served if this plant were discontinued as a local experiment station and the equipment, with what alterations may be necessary, be given to the use of the poultry commissioner in the investigation of poultry diseases, etc.

5. In consideration of the noble work done for this Dominion by Prof. A. G. Gilbert during the past twenty-five years, we suggest thathe be relieved of the personal supervision and management of the poultry plant at the experimental farm and his services be recognized and retained by appointing him chief poultry lecturer for the Dominion, attached to the poultry commissioner's staff.

The recommendations, as laid before the minister, receive not only the full endorsement of the Canadian Poultry Producers' Association, but they are also made with the full concurrence of all prominent poultrymen and others interested in the industry. If the recommendations are adopted it is fully expected the poultry industry in Canada will receive a great impetus.

Get Rid of the Roosters.

Experiments by poultrymen show that a cock eats enough each month to produce a dozen eggs, if the same food he consumes were fed to a good hen. Old cocks and nonproductive hens eat but return no income. Half a dozen cocks with five or six dozen hens, will produce all the fertile eggs needed for incubation; while the hens, after the removal of the males, will continue to lay as many, as large and as good eggs as they will when in the company of the male birds. The policy of separation of the sexes after the incubation season, results in vigor and thrirf among the remainder of the flock, and in greater profit to the owner. Get rid of the old cocks and lazy hens. They are only feed consumers and drones. Then select a dozen of your most energetic active, happy hens, and a male of like quality, the best fighter in the bunch. Give them a small house and yard by themselves with lots of straw to compel exercise; all the grain they will dig for, milk, alfalfa leaves or other green food, such as cabbage, beets, etc., and table scrap; then use the eggs from this pen for hatching. Then, as says the Colorado Experiment Station, if you don't get better chicks than you ever had by the old haphazard way —better hatchers, better growers, better lookers and better and earlier layers— we'll never say a word against the old roosters again.

The members of the Newfoundland Poultry Association held their regular monthly meeting on Tuesday night, March 7th, in a room kindly placed at their disposal by the Department of Agriculture and Mines. After a quantity of routine business had been disposed of, Mr. Percie Johnson read a most interesting paper on his visit to the Amherst Fair and Poultry Show. The address was not only interesting, but most helpful and instructive, and the lecturer illustrated his remarks with the aid of three different kinds of trap nests, showing how it was quite easy to distinguish the laying hen from the boarder, and to identify the particular egg which each hen laid. Mr. Johnson also showed samples of sprouted oats, grown without any earth whatever, a splendid green food for the winter, also ground fresh meat bones, which he stated considerably helped the supply of winter eggs. Those present were greatly interested and many questions were asked and answers given. Mr. G. W. Gushue, in moving a vote of thanks to Mr. Johnson, expressed the feelings of all present when he said a most pleasant evening had been spent and valuable and helpful information obtained. The association hope soon to have rooms of their own, which will be well supplied with poultry literature from the most reliable authorities. It is surprising that so little attention is given to the healthy, interesting and profitable industry of poultry keeping.—Evening Chronicle.

When you mow the lawn, save the fresh clippings of grass and clover for the fowls that are confined. Green food is essential to fowls of all ages.

When the breeding season is over, separate the cocks from the hens. Where one has limited space and only a few hens, it would pay to dispose of the cocks.

OWNERS ARE PROUD OF I H C WAGONS

There is a certain pride in owning a wagon that you know is built of the highest quality materials obtainable —a wagon that is not only attractively finished with the best paint and varnish, but which also gives perfect service, day after day, and year after year. That's why I H C owners are so proud of their wagons.

If you want to be proud of your next wagon—choose one of these two in the I H C line—

Chatham or Petrolia

The loads they carry, the roads they traverse, and their wonderful durability make others wish they had bought a Chatham or Petrolia.

Chatham Wagons have a long record for satisfactory service in Canada. Made with hard maple axles, oak bolsters, sand boards, rims, and spokes, and oak or birch hubs—they represent the highest standard of wagon construction. When you buy a Chatham wagon it is with the assurance of getting the utmost service and satisfaction out of it.

Petrolia Wagons are constructed of first quality woodstock which is thoroughly seasoned by being air-dried. The ironing is of the very best. The inspection of each part is most rigid.

Be sure to call on the I H C local agent, get a pamphlet, and let him show you one of these wagons. If you prefer, write the International Harvester Company of America at nearest branch house for any information you want.

IHC Service Bureau

This Bureau is a clearing house of agricultural data. It aims to learn the best ways of doing things on the farm, and then distribute the information. Your individual experience may help others. Send your problems to the I H C Service Bureau.

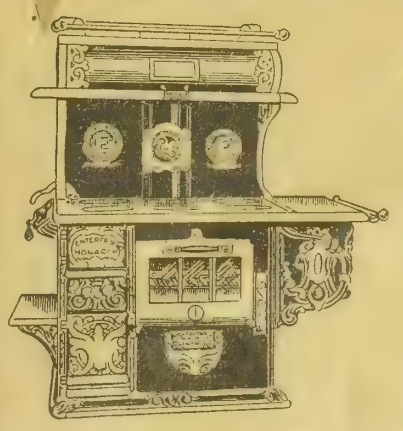
ASK ANY HOUSEKEEPER WHO USES ONE
WHAT SHE THINKS OF THE
ENTERPRISE MONARCH

The STEEL RANGE for Farm or City Kitchen.
For Wood or Coal Burning.



With its heavy castings, large firebox for wood, quick-acting reservoir and numerous labor-saving devices, it is the most economical range you can buy.

There are several thousand happy housekeepers in the Maritime Provinces using the MONARCH, and as the best advertisement is a satisfied customer, we take pleasure in referring to any one of these.

We will send a list to anyone interested, also copy of circular with illustrations and particulars. Write us if your dealer does not handle the MONARCH.

The Enterprise Foundry Co., - Sackville, N. B.
MANUFACTURERS.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad. as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

Demonstration Orchard Work in York, Sunbury and Albert Counties

Believing that many of the farmers would give more care and better attention to their orchards were they more convinced that by doing so they would yield their most profitable crop; the Provincial Department of Agriculture, under the direction of the horticulturist, has taken hold this spring of the orchard of Mr. Joseph Hawkins, Sugar Island, York County, and a portion of the orchards of Mr. J. W. Clark, Maugerville, Sundbury County, and of Mr. H. L. Steeves, Lower Coverdale, Albert County, with the aim of giving as complete a demonstration as possible of the successful renovation and arrangement of bearing orchards. These orchards have already been pruned, the rough bark scraped off the trees and wounds resulting from sunscald, canker, etc., carefully cut back and painted. A dormant spraying consisting of commercial lime sulphur, diluted with water 1 to 9 for the purpose of destroying the oyster shell scale and removing lichens and other fungous growths has already been applied. It is intended to apply three other sprays for the control of the apple scab, codling moth worm and leaf eating insects as follows:

1st. Just as leaf buds are swelling.

2nd. Just before blossoms open.

3rd. Just after blossoms fall.

In the orchards in Albert and York, a medium application of barn yard manure is to be ploughed under and then about 800 lbs. of Basic Slag and 500 lbs. of Sulphate of Potash scattered broadcast and harrowed. In the York County orchard about 300 lbs. of nitrate of soda will also be supplied. The orchard at Maugerville being on intervale land will not be ploughed, but top dressings of fertilizers will be experimented with a modification of the sod mulch system followed. In the other orchards cultivation will be kept up until about June 25th when the land will be seeded down to cover crops such as summer vetch and mammoth red and crimson clovers.

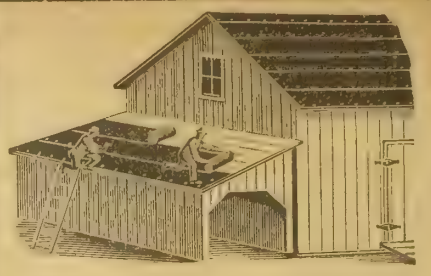
Experiments will be conducted in the thinning of the fruit on the trees along the lines of modern practise elsewhere. Meetings will be held in these orchards during the summer, announcements of which will be made later. All those in the vicinity of these orchards and interested in apple growing are invited to visit them at various times throughout the season and observe the methods of pruning, spraying, cultivation, thinning, picking and packing, and the general progress of the orchard. The result of the season's work in these orchards will be published throughout the province and brought prominently before the Fruit Growers' Association Convention in St. John, in November next. If this work proves of benefit to the farmers of the locality in which it is carried on, it will probably be taken up in other counties next year.

Standing Grain Competition in New Brunswick.

Editor Maritime Farmer:

Replying to yours of the 27th in regard to the Standing Crop Competitions which our Department would encourage in New Brunswick this year, I beg to say that up to the present time arrangements have been made to give special grants of $100 each to the Andover Agricultural Society to conduct a competition, open to farmers in the County of Victoria who belong to an agricultural society. It is expected that this competition will include wheat, oats, potatoes and turnips; to the Queensbury Agricultural Society for a competition, open to all farmers in the County of York who join that society, the competition to include crops named above; to the Northumberland Agricultural Society, open to farmers in the County of Northumberland, conditions as to membership of societies has not yet been stated nor the number of crops to be inrluded; to the Sussex and Studholm Agricultural Society, open to farmers in the County of Kings, conditions for entry which have not yet been stated to the Department nor the number of crops to be included. Other counties have not yet come in. A competition is being conducted by the Botsford Agricultural Society for which $100 is offered by Medley G. Siddall, Esq., of Port Elgin.

Mr. S. J. Moore, the Maritime representative of the Dominion Seed Commissioner, will probably arrange for one or two more competitions for which this Department will pay $100 each and his branch will provide judges.—W. W. Hubbard, Secy. for Agriculture.



MICA ROOFING

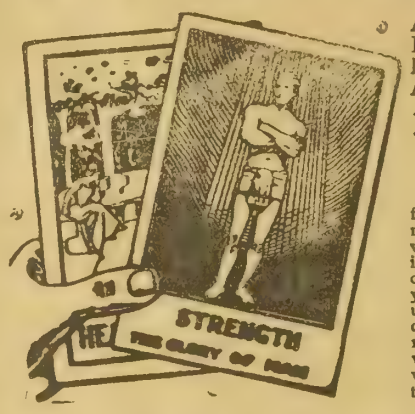
A MAN'S BOOK.



A PRIVATE TREATISE, WITH ILLUSTRATIONS, RELATING TO DEBILITY, ITS CAUSE, EFFECT AND HOME CURE.

Let Me Send It to You FREE.

Here is a little volume of cheer and helpfulness which all men, young or old, can read with great profit, it contains much valuable information, of a private nature, is is fully illustrated, and represents the practical knowledge I have gained from forty years of actual experience in giving help to upwards of 100 000 enfeebled, nervous, discouraged men Just a post card with your name and address and the book will be forwarded free, sealed, by return mail, and with it as well, I will enclose a full description of my new 1910 model Electric.

Health Belt

If you need new strength, this wonderful appliance must appeal to you. It generates a pleasant, exhilarating currant instantly felt, though it can be made any degree of strength from mild to strong by simply turning the needle of the current regulator; worn nights while you are sleeping, it pours quantities of health-giving, soothing electricity into your sick, weak nerves you get up mornings feeling bright, strong, full of courage and ambition; it takes all the weakness and pain out of your back; it is a great remedy for your kidneys, bladder, stomach, liver and other vital organs; it cures rheumatism in all parts of the body; it is a courage-giver of the highest order; it brings new strength where weakness exists; it will restore you to vim, rigor and true manhood as sure as night follows day; it makes you feel young and look young; you will live longer for its use; you can throw away all drugs and commence to live as Nature intended you should—a man among men healthy, happy and vigorous. I can send you thousands of testimonals if you care to see them.

"Your Health Belt cured me of Nervous Debility, Lost Vigor, Kidney and Bladder Troubles after all else failed.

"CHARLES L. SNELL,
"Middleport, N. Y."

In all instances I concentrate the full positive current at small of back; it thus enters the system at the nerve and vital centre,

passing thence through the different weakened organs, giving them new life and force. You can get the Belt.

ON TRIAL UNTIL CURED

or for cash at a discount, just whichever you wish. Send your address on postal or fill in coupon; or, call at my office, you who live in or near this city. Advice concerning your case will be cheerfully given without charge or obligation.

DR. M. F. SANDEN CO., 140 Yonge Street, TORONTO, Ont.

Dear Sirs—Please forward me your book as advertised free.

NAME.....

ADDRESS.....

Thoroughly Disgusted With Scrub Stock.

Editor Maritime Farmer:

Will some one, through the Maritime Farmer, offer suggestions as to how a farmer with small capital could in the best and cheapest way begin a herd of purebred cows and a flock of purebred sheep, also an opinion as to the best breedf The information sought will be gladly welcomed by one thoroughly disgusted with scrub stock.—A Subscriber.

Ans.—As to how a farmer with small capital can best and cheapest lay the foundation for a purebred herd of cows we would suggest that having decided on what line to follow, we will suppose it is dairying, and having selected the breed he wishes to breed, and this must hinge on the farmer's environments and conditions, that he feed and care for the cows he now owns and keep an accurate record of the performance of each cow.

If there is an agricultural society in your disrict that keeps a purebred bull and he is the line of breeding you want, use him on your best cows. You may then purchase a heifer calf or two or an in-calf cow or heifer of the breed from some breeder who will guarantee you an animal of a good producing strain.

If there is not an agricultural society in your district that keeps a purebred bull, you might buy a young bull or perhaps you could buy an old bull whose get prove that he is a sire of good producing stock. Your calves from your common cows will be half bred. If your district society is breeding Ayrshires, we would advise you to breed Ayrshires; you will find it cheaper and better in the long run. If Holsteins, Jerseys or Guernseys are already bred in your district follow which ever breed it may be, but stick to the breed you select.

The same fundamental principles apply to laying the foundation for purebred stock of any kind.

Perhaps some of our readers will furnish some other suggestions.

Sick Bull.

Subscriber, P. E. I.—I have a Holstein bull, coming eight years old. His front teeth seemed to get loose about a year ago, and he has been failing since. He got a little better last summer but he is very bad this spring. He won't eat hay and very few pulped roots. He eats mashed grain fairly well. He will drink only about a half pail of water a day and he seems to tremble after drinking any cold water. I would like to know what is the cause. It appears like stomach trouble as there is a bad smell from his breath.

Ans. The incisors, front teeth, of cattle are not solid same as those of horses and when the animal is sick the teeth are looser than in health. It would be well to have the animal tested for tuberculosis and if not tubercular give a physic of two pounds of Epsom salts and two ounces of ground ginger dissolved in two quarts of warm water. Give at one dose as a drench. For 12 hours before giving drench give wheat bran mashes and water only, and for 14 hours after give only the same kind of food. Then give small quantities of good hay, early cut, well cured clover preferably and reasonable quantities of crushed oats and wheat bran twice a day also pulped roots, mangels or turnips. Water frequently and give well regulated exercise daily. Give as a drench night and morning two drams of Nuxvomica, four drams of ginger and two drams of Gentiain, all pulverized, and mixed in one pint of water. If he is not tubercular the above will improve his appetite.—J. Standish, V. S.

CALF MEAL

BIBBY'S CREAM EQUIVALENT

Young Calves develop and grow surprisingly well when fed "Cream Equivalent" either with or without separated milk. It is not a drug or "FAKE" meal. Made by one of the most honorable firms in England. Has the largest sale of any Calf Meal in the World. Canadian Government report shows it to contain the highest percentage of nutritive value. TRY A BAG, 50 lbs. $2.25.

Can be fed with either Hot or Cold water.

FLORICULTURE

All inquiries answered by H. E. Goold, Florist, Sussex, N. B.

Dalhia, Chipman, Queens Co., N. B., writes:—Would you be so kind as to give me some idea as to how Dalhias are classified. I find in the catalogues Show Dalhias, Cactus and Pompoms with their colors but am unable to tell even from the photos attached the exact difference.

The best answer to this inquiry is probably the classification as given by the New England Dalhia Society to govern their exhibition as follows:

Dalhias are double, semi-double or single.

A double Dalhia consists of a close mass of ray florets and in their perfect form show no central disc. They include three types.

1. The globular or show type approximately spherical in shape, having florets nearly equal in length and breath, often quite circular and always incurved, rolled or cupped.

2. The decorative type having flowers flat or approximately so with flat flowers.

3. The cactus type distinguished by long relatively narrow flowerlets rolled back.

Pompom or Liliputian Dalhias are mall flowering varieties of double type.

B. Semi-double Dalhias have two or more rows of ray flowerlets surounding a well-defined central disc.

C. Single Dalhias have a single row of ray floerlets surrounding a entra, disc. The typical single Dalhia has eight flowerlets.

Plain flowers have but a single color or if bi-colored have the ground color lighter than the tips.

Fancy flowers are striped or have the ground color darker than the tips This distinction applies to all types.

Reorganized classes for exhibition are Show Dalhias.

a. Plain.
b. Fancy.
c. Other sub-divisions.

Decorative Dalhias and sub-divisions.

Cactus Dalhia any sub-divisions.

Pompom or Liliputian Dalhias, any sub-divisions.

Semi-double Dalhias.

a. Holland Paeony—flowered.
b. Any other sub-divisions.

Single Dalhias.

a. Colorette.
b. Anemone—flowered.
c. Giant—flowered.
d. Any other sub-division.

The above is simply a classification and must not be misconstrued.

Constant Reader, writes:— How shall I treat a Lobster Cactus? It bloomed very nicely until the first of January. The pot it is in is very small. Should I repot it after it rests? What sort of soil is best for it?

Repot the Cactus in a light, sandy soil, using a pot at most only two sizes larger. Put some broken pot in the bottom for drainage. Water spareingly during the summer, keeping it rather on the dry side, yet not dry enough to wither the foliage. Start watering in October.

At this season a few words about the improvement of gardens and grounds might not be out of place. It is the best time to prune shrubs, vines, broken evergreens and to trim up walks, the edges of lawns, drive ways, etc.

If there are any spots on the lawns that have been winter killed see that the old grass is carefully cleaned off and that after the soil has been lightly stirred, grass seed has been sowed and all well firmed down. There are many different ideas about the best sorts of grass seed to sow. I generally use white clover, one

THE ORIGINAL "HALLOCK" WEEDER.

The object of a weeder is to keep down the weeds, therefore, it resolves itself into this one fact: that a weeder should be used early and often, so as not to give the weeds a chance to grow. You will not injure your crops by working the ground directly over the plant or grain, but will do much toward increasing the growth and yield.

You can work them in wet or dry weather, they will not cut the roots of the crop, but cultivate just deep enough to retain the moisture just where it is needed. But, do not forget the old rule—use the WEEDER early and often, and when you are all through with all kinds of other cultivators, our weeder will finish your job in No. 1 shape. Thousands in use. Write for prices and terms.

Send in your order now for the "HALLOCK" Weeder. Goods are now in hand, all orders will receive our prompt attention.

BOILS AND PIMPLES

Are caused altogether by bad blood, and unless you cleanse the system of the bad blood the boils or pimples will not disappear.

Get pure blood and keep it pure by removing every trace of impure morbid matter from the system by using the greatest known blood medicine,

BURDOCK BLOOD BITTERS.

Boils Cured.

Mr. A. J. Saulnier, Norwood, N.S., writes:—"Two years ago I was troubled with boils on my neck and back, and could not get rid of them. A friend recommended me to try Burdock Blood Bitters, and after using two bottles I was pleased to note the boils were entirely gone, and I have not been troubled with any since."

Pimples Cured.

Miss Eva A. Skinner, Granby, Que., writes:—"I am pleased to recommend Burdock Blood Bitters as it has done me much good. My face was covered with pimples, and being advised by a friend to try Burdock Blood Bitters and have them removed I did so and I now have not a spot on my face."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

Spring Cleaning

is cons'dered a necessity by everyone and yet they fail to eradicate from their blood the accumulated impurities, whose presence is indicated by listlessness and loss of energy and by the occurrence of canker and pimples. If these impurities are left in the body it is in a suitable condition to fall a prey to tuberculosis and other diseases

For this purpose thousands of people take 2 bottles of

GATES' LIFE OF MAN BITTERS

And 1 of Gates' Invigorating Syrup every Spring

These increase the activities of the organs which remove wastes from the blood, and thus the system is fortified to withstand the summer exertions.

Sold everywhere at 50c per bottle

C. B. Pidgeon's Mail Order House is a Maritime Province concern—patronize it.

part to five parts Kentucky blue grass, or the same proportions of clover and a good lawn grass mixture. I have had good results with both of these. In places where the grass always winters well, the clover can be omitted and a pure clean grass sod obtained. Have a border, if possible, of old-fashioned hardy perennials. They are sure to grow and bloom with little care, giving bloom throughout the season. Such plants as Hollyhocks, Peonies, Phlox, Columbine, Larkspur, Hardy Pinks, Sweet Williams, Forget-Me-Nots and of course, a few hardy Roses, such as Paul Nezron, General Jacquminot, Margaret Rickson, Madame Plantin and a few Moss Roses.

If a Climber can be used, get the Crimson Rambler or a Dorothy Perkins.

On a lawn or any grass plot a few pretty shrubs, such as the Hyderangia Paniculata, are especially effective with Golden Elder, with its golden foliage and is perfectly hardy everywhere. Verandahs can be covered with Honeysuckles or Clematis and on the brick or stone wall the Boston Ivy should be used. If you have room for a few trees the Horse Chestnut, Elm, Oak Leaved Mountain Ash, Linden and Cut Leaved Maple are all hardy. Carolina Popular is one of the quickest growing.

Planting of all the above mentioned varieties should be done on the first of May. For cemetery lots any of the above mentioned shrubs are good.

After the first warm rain look at the hardy roses that have been covered and if growth is started well uncover.

Repot pot-bound plants and be sure that the drainage is perfect.

In planting prepare the ground by thorough spading where the shrubs etc., are to be planted. If any old well-rotted manure can be obtained pade it in thoroughly but never apply fresh manure or chemicals when lanting.

Fruit Blossom.

The season of blossom is near at hand, and with it the anxieties of the period, which will not come to an end until the last of the petals of the apple flowers have flickered to the ground in June, and not until then can any reliable estimates of the prospects of fruit crops be formed. In point of blossom alone the outlook at the moment is promising. We may look out on plum trees studded with pearly flowers, the pear may be well clustered with bloom, and soon the cherries will be a sight to observe, but the fruit grower knows from experience that blossom, though primarily essential, is not everything and an untimely visit from Jack Frost at the critical period may make all the difference. It is true that in some places attempts are made to protect blossoms on frosty nights by means of heats, but these efforts are more or less experimental and the rank and file of fruit growers, both commercial and otherwise, leave themselves in the hands of the clerk of the weather, and hope for he best. It is a great relief to get hrough the blossoming season safey, and if the possibilities of wintry weather at this critical period did not exist, fruit growers would be relieved of one of their chief anxieties.

Chamberlain's Stomach and Liver Tablets will clear the sour stomach, sweeten the breathe and create a healthy appetite. They promote the flow of gastric juice, thereby inducing good digestion. Sold by all dealers.

Do You Intend To Abandon Your Farm?

In New England there are hundreds of abandoned farms—abandoned because the soil has been drained of its fertility. Had these farms been properly fertilized they would still be producing bounteous harvests.

New England farms are not the only ones that are being depleted of fertility. There are thousands of other farms which are rapidly approaching the point where further cultivation will be unprofitable unless some means is adopted to renew the fertility of the soil.

If you do not intend to abandon your farm, it will be necessary to supply fertilizer to the soil. It is not only necessary to apply manure, but it is absolutely essential that it be applied evenly and in proper quantities.

Manure cannot be spread evenly by hand. Experience has demonstrated that the spreader is the only method by which manure can be applied uniformly.

It is just as necessary to exercise judgment in selecting a spreader as it is on any other subject. There are many spreaders on the market. The I H C spreader has proved its superiority by giving the users years of efficient service. With an I H C spreader you can regulate the distribution of manure so as to make every ounce count. Adjustments can be made to spread a light top-dressing or a heavy covering. This is possible because I H C spreaders have a wide range of feed, and the long, square, chisel-pointed beater teeth thoroughly pulverize the manure that is applied. Wide tires and roller bearings insure light draft.

I H C spreaders are made in two styles—

Cloverleaf—Corn King

Cloverleaf spreaders have endless aprons. Corn King machines have return aprons. These machines are made with capacity suitable for farms of any size. Call on the I H C local dealer and let him show you the style and size best suited to your purpose, or, if you prefer, write to nearest branch house for catalogue and full particulars.

Sweet Peas, Hampton, writes:—Would it hurt Sweet Peas to put some chemical manure in the trench with the seeds? What six varieties would you recommend to plant? How late may they be planted with good results?

I would be afraid to use the chemical in with the seeds. I think it better to apply near the surface after the peas are up. Miss Wilmot, yellow; Prima Donna, pure pink; Gladys Unwin, light pink; Nora Unwin, best white; Black Knight, deep maroon; Lady Grisel Hamilton, lavender and Salopian, pure red are the best varieties of Sweet Peas and carry a large range of color.

H. M. N., Rothesay: What varieties of hardy plants should I plant to make a bed against a wall that will require little care during the summer and make some show. Do they require rich soil and sunshine?

Almost all perennials want good, rich soil and sunshine. Pereennial Phlox, Columbines, Gypsophila, Spireas, Larkspurs, For-get-me-nots and Pinks would fill your requirements. Some little protection would be required during the winter.

The last of May is quite time to plant Daisies, Holly Hocks and all semi-hardy plants in small gardens. Asters, Verbenas, Geraniums, etc., may be planted if they are covered on what few cold nights we are likely to have. Poppy, Nasturtium and Mignonette seed as required for late blooming. A few plants of Canary Creeper about a verandah porch are very easily grown and are pretty during the summer. The seeds may be planted now.

Dig out the dandelions on your lawn and if your neighbor will not do so at least persuade him to keep the blooms cut so that the seed will not blow on your lot.

Plant Asters, Verbena, Drummond Phlox, Stocks and Mignonette for cut flowers. These plants will all give a wealth of bloom with little care.

When your Sweet Peas are four or five inches high have the soil drawn up around them until only the tips are out as this will increase the root growth and wonderfully stimulate general growth.

When the Tulips and other bulbous flowers that are occupying room that is required for other flowers are done blooming dig them up carefully and plant in a trench in an out-of the way corner, where they can remain until they have completely dried off, which will usually be about the last of July, when they should be dug up and cleaned and put away in a dry sand until planting time. This transplanting should be carefully done, breaking the roots as little as possible. They should be planted a little deeper than they were before and well watered for a few days until the soil becomes firm about them.

The cut worms will soon begin their annual destruction; watch for them each morning and as soon as you see a plant cut off close to the ground dig around it about an inch deep, when a small grayish worm will usually be found. This is the surest way to get rid of this pest. They usually begin work on the Sweet Peas, so it is best to look over them every morning for the next four weeks as they are apt to cause much damage if allowed to go their way undisturbed.

Rake and cross-rake all winter-killed spots on the lawn and after sowing grass seed roll well. Kentucky blue grass and clover makes a fine lawn grass mixture for use about St. John. In preparing your flower beds avoid green manure or lime and black mud unless composted at least a year. If soil is poor arrange to give liquid manure rather than strway, green manure.

"the finish that endures"

M L Floorglaze

Use it to make floors bright and smooth as glass, easy to keep clean, (soap and water won't hurt M L Floorglaze). Doesn't get cracky; doesn't show scratches; lasts amazingly and holds its beauty. M L FLOORGLAZE comes in tins of handy size, little and big. Choose among 17 enduring colors in solid enamel—seven shades in Lacs that imitate hardwoods exactly—and Transparent for natural finish. M L Floorglaze won't fade and is weather-proof—so use it on outdoor work as well as for indoors. Has a hundred uses about your home—ask your dealer or get new from us direct. Imperial Varnish & Color Co., Ltd., Toronto, Ont.

Branches also at Winnipeg and Vancouver.

Ask your dealer for information and color card or drop us a card to our nearest address, Toronto, Winnipeg, Vancouver.

Roman Hyacinths.

J. E. W., Hillandale:I have a bowl of Roman Hyacinths that bloomed some time ago. Small bulbs have come out on the sides of the old ones. Can the new ones be grown for next year? Can the old ones be preserved for another year? How shall we manage them? They have een growing in water.

Ans. Roman Hycanths grown in water are of little value for forcing another year and are not worth bothering with. The little bulblets can be potted when the out-door planting season arrives and placed in the ground about the first of July and should be dug up and dried off and potted up in October or before. If this treatment is followed for two seasons they will flower. They will not flower the first season from bulblets. It is a good deal of work to preserve a a cheap bulb and few care to take the trouble in the ountry.

Potash.

Subscriber, P. E.I.—(1). Do you consider the use of concentrated Potash or Lye of any value as a fertilizer?

(2) Do you think it a good practice to dissolve Potash in water and sprinkle on manure heaps?

(3) Will Potash used in that way have any effect in cutting up long or strawy manure?

(4) Is Potash sold by dealers in fertilizer as valuable for above uses as concentrated Potash or Lye. Note this concentrated potash or lye mentioned is the kind generally used here for soap making and some farmers use as fertilizer and I would like to know if you think the practice a good one.

1. Although potash is one of the three most important elements of plant food and is a valuable fertilizer when furnished in a combined form, such as sulphate or chloride, the use of caustic potash or lye is not permissable. This compound is so corrosive in its nature that its application would do very serious injury to growing vegetation.

2. No; such a practice would do great harm. The presence of caustic potash would result in the decomposition, at least in part, of the nitrogen compounds of the manure causing the liberation and dissipation of this valuable element as ammonia. Further, subsequently, by the use of such treated manure a great risk would be run of injury to vegetation.

3. The action of a solution of the caustic potash or lye on straw would undoubtedly be toward softening the latter, but we do not advise such a practise for the reasons already advanced and further fact that the physical condition of such treated straw would make it difficult to handle.

4. The potash sold in fertilizers is present either as sulphate or chloride non-corrosive forms and compounds from which the roots of crops can readily take the potash they require.

From what has already been said, the potash used for soap making, potash lye, should not be used as a fertilizer—and such a practise, if it xists, should be at once given up or distinct injury to the soil may result.—Frank T. Shutt, Dominion Agricultural Chemist.

One of these high class "Royal" semi-porcelain dishes made by the famous house of Dodson, Wilcox & Till, Ltd., of Hanley, England, or a glass tumbler, similar to those in use in the King Edward Hotel, Toronto, is found in every package.

STOCK NOTES.

J. F. Roach, breeder of purebred Ayrshires and Guernseys, Sussex, N. B., informs us that owing to the difficulty and expense attached to the maintenance of two purebred herds he has decided to sell his Guernsey herd at rock bottom prices and devote his full attention to the breeding of Ayrshires. He has for sale one Guernsey bull, 26 months old, very large for his age and a true type of the breed, that he purchased from J. F. Butler, of Maine. He is also offering three very nice Guernsey calves dropped in December.

Harding Bros., Welsford, N. B., writes: "Our stock has come through the winter in good working shape. We have the best lot of calves of both sexes we ever had, mostly sired by Sir Mercena Faforit Lad, a bull that is proving to be a rare good sire and with grand record backing. We have sold our former stock bull, Tiet's Jacoba's Gay Lad to Leonard Piet's Jacoba's Gay Lad to Leonard and expect to hear good reports of him later. Our stock is sold out pretty well but we expect to import some females of quality in the near future.

H. J. Colwill, merchant, of Arthur Ontario, and ex-warden of Wellington County, writes as follows to Messrs. B. H. Bull & Sons, proprietors of the Brampton Jersey herd.—"The Jersey cow, "Brampton Foxy" No. 1507, arrived quite safely and I assure you I am more than pleased with her she is so nice and kind and a splendid milker; her milk is so rich you would almost think it was cream. She is without doubt the finest looking Jersey I have ever seen and I cannot recommend your herd too strongly to any person wanting to buy pure bred Jerseys and I am sure you deserve credit for the fine Brampton herd you have, wishing you every success with Brampton Jerseys as they are all fine specimens of the Jersey breed."

B. H. Bull & Son, proprietors of Canada's greatest Jersey herd, are enjoying the greatest success yet from all standpoints. Brampton Jerseys and their descendants have won more prizes and great honors within show ring and milk and butter tests than the Jerseys of any other establishment in Canada. Look out for some more big yearly records. Many of their greatest prizes at almost all of the greatest fairs in Canada last year were captured by Brampton Jerseys or their direct descendants from St. John, New Brunswick, to British Columbia. Who will do the winning this year?

C. Kane bought a carload of lambs last fall at Elmsdale, P. E. I. In the car there were thirty three lambs that weighed 3296 pounds, making an average of nearly 100 pounds each. They were bought from Jacob Murray, a well known farmer of Elmsdale. There were also in the carload eleven lambs weighing 1197 pounds bought from John Murray, son of Jacob Murray, above mentioned. The whole carload averaged 96 pounds per lamb. If any other carload bought last season can beat this we would like to hear from it.

The Safest Fence to Buy

Safe because it will stand shocks and ill usage.
Safe because it is a complete barrier against all kinds of stock.
Safe because its tough, springy steel wire will give real service.

PEERLESS The Fence that Saves Expense

is built of No. 9 galvanized wire of guaranteed quality. To this best of wire add the Peerless method of construction and Peerless lock and you have a fence without a rival.

We've built Peerless fence twice as good and twice as strong as is necessary under ordinary circumstances so that neither accidents nor extraordinary wear can affect it. It saves you money because it is long lived and never requires repairs. We know there is no fence made that will give you more lasting satisfaction. Write for particulars.

We also make poultry and ornamental fencing and gates—all of it of a quality that our customers appreciate and we are proud of.
Agents wanted in all unoccupied territory.

Dept. K, Winnipeg, Man. Hamilton, Ont.

PAQUET GUARANTEED CLOTHES

New Style Book Ready for Mailing

WE have much pleasure in announcing that our new 1911 Style Book of PAQUET Guaranteed CLOTHES for Men is now ready. The values this season are better than ever—the patterns are new and attractive—the styles right up to the minute.

We GUARANTEE that the prices quoted in this Style Book are the lowest in Canada for the same value—the same amount of style—the same quality—the same careful workmanship.

For $10.00

You may have your choice of six different patterns in high-grade tweeds, serges and worsteds, delivered PREPAID to your nearest Railway Station.

For $15.00

The selection is better than ever. The materials are exceptionally fine, pure wool worsteds—and we pay delivery charges to any part of Canada.

Write TO-DAY for this Style Book

Don't put it off until some other time. Sit right down and write us NOW. A postcard will do. You'll get the book and samples of materials by return mail.

THE PAQUET COMPANY LIMITED.
QUEBEC, CANADA.

One Million Concrete Blocks For One Farm!

This shows what farmers think of "Ideal" Concrete Blocks and Machines. On the magnificent estate of an Ohio millionaire, one million concrete blocks are being made for building sixteen residences, twelve barns, four 50 foot silos, power houses, chicken houses, etc. — and four miles of concrete fence.

"IDEAL" FACE DOWN CONCRETE BLOCK MACHINES

have displaced TWENTY MILLION BRICKS on this one job alone—because they make the blocks right on the spot—save freight and hauling—save time and hard work—and make more durable buildings that are absolutely fireproof.

An "Ideal" Machine will pay for itself on your farm—and you can make a profit out of it by turning out concrete blocks for the neighbors.

Write us for catalogues and full particulars.

IDEAL CONCRETE MACHINERY CO. LIMITED
Dept. M, LONDON, Ont.

SKIN SUFFERER TRIED EVERYTHING—THEN D. D. D. CURED.

This was the experience of Mrs. Geo. Newman, of Orangeville, Ont. She wrote in Jan. 1910:

"I was terribly troubled with eczema on my face, neck and hands for four years. I tried everything I had heard tell of, then saw your advertisement in the paper, sent for a trial bottle of D. D. D., used it on my face and got well. It is now two years and no return of the eczema. I consider I am cured and it certainly was a blessing to me."

No matter how terribly you suffer from eczema, salt rheum, ringworm or any other skin disease, you will feel instantly soothed and the itch relieved at once when a few drops of this compound of Oil of Wintergreen, Thymol, Glycerine, etc., is applied. The cures all seem to be permanent, too.

For free trial bottle of D. D. D. write the D. D. D. Laboratories, Dept F. M., 49 Colborne St., Toronto.

(For sale by all Druggists.)

Minard's Liniment Co., Limited.

I was very sick with Quinsy and thought I would strangle. I used MINARD'S LINIMENT and it cured me at once.

I am never without it now.

Yours gratefully,

Nauwigewauk, Oct. 21st. MRS. C. D. PRINCE.

Root Growing in Nova Scotia.

(Continued from page 529.)

opportunity to get in its work. It is considered by some to be a wise recaution to sow late. I do not, however, consider this necessary, because if the first sowing should happen to be destroyed, the field can be re seeded with a good chance or success.

Club Root, once a foothold is gained, is of a more serious nature and needs to be carefully guarded against. As a precautionary measure, roots should not be grown frequently on the same piece of land. At the first appearance of the disease, the affected roots should be carefully separated and not allowed to get into the manure which is to be subsequently used for growing this crop. In every case where I have known of any serious trouble with this disease it has been on farms where roots have been grown for several years in succession on the same fields. Where a judicious rotation of crops is followed, the disease is almost unknown.—By F. L. Fuller, in 1908 N. S. Agricultural Report.

The Kentville Horse Show.

A splendid horse show was held in Kentville, N. S., on April 27th, which is regarded as the best ever held in the county. Numbers came from outside the county to enter horses, and all sections of Kings were well represented. An active committee composed of Dr. W. B. Moore, Dr. W. S. Woodworth, C. P. Foote, W. M. Carruthers, J. R. Webster and John Tobin had everything in good order.

The parade in the morning around town was excellent. The judging took place on the old exhibition grounds in the afternoon, and later few select horses were taken to the ld race track at Aldershot to have a final speed trial. Mr. J. Adams, Halifax, made a very satisfactory judge. The prize winners were:

Standard Bred Horses—1, H. Lydiard, Centreville; 2, G. Blanchard, Upper Cunard; 3, A. Bowser, Grand Pre.

Roadsters—1, Norman Chute; 2, Cabel Bill; 3, Walter Moore.

Carriage Horses, single—1, Mrs. Norman Chute, Bridgetown; 2, John Redden, Kentville.

Nova Scotia Carriage Co. Special Prize for horse and carriage—the atter to be manufactured by the N. S. C. C.—1, Mrs. Norman Chute; 2, Norman Chute, Bridgetown; 3, G. Blanchard, Canard.

Agricultural Horses, single—1, Mr. Tupper, Kingston; 2, M. K. Ells, Port Williams; 3, A. Banks, Waterville.

Heavy Agricultural, in pairs—1, Earl Burgess, Wolfville; 2, T. Bishop, New Minas; 3, A. Caldwell, Wolfville.

Heavy Draft Horses, in pairs — 1, C. C. H. Eaton, Canard; 2, George Starr, Starr's Point; 3, J. H. Lyne-Evans, Church Street.

Saddle Horses—1, Miss Chipman, Chimpan Corner; 2, Miss Blanchard, Canard; 3, Miss DeWolfe, New Minas.

The horses were of a much better class than had ever been exhibited before—special mention being made of single carriage horses, Mr. Adams paid a special compliment to the young lady riders, saying he had never before seen a better exhibition of horsemanship.

John D. Rockfeller would go brok if he should spend his entire income trying to prepare a better medicine than Chamberlain's Colic, Cholera and Diarrhoea Remedy for diarrhoea, dysentery or bowel complaints. It is simply impossible and so says every one that has used it. Sold by all dealers.

Amatite ROOFING

Why the Buyer of Amatite Never Complains

When a man buys ordinary ready roofing he usually neglects to paint it and after three or four years he comes back to the dealer with a protest. It is human nature to neglect painting roofs.

When a man buys Amatite Roofing he lays it on his building and in three or four years it is still as good as new and does not need any paint. He forgets he has such a roof but no harm is done by that.

There is nothing to neglect in the case of Amatite. Amatite has a peculiar surface—a sort of plastic concrete made of pitch and mineral matter.

This surface is plastic enough so that the material can be rolled up into handy rolls in the usual manner and handled just like any other ready roofing. When unrolled on the roof and nailed down it presents to the weather a continuous surface of mineral matter and pitch. On this surface wind, rain, storm, heat and cold have little effect. Year after year it looks up to the sky undisturbed and unaffected. It costs nothing to maintain and relieves the owner from all responsibility.

Dealers can improve their business by selling Amatite and buyers make a good bargain when they buy it. The price of Amatite is less than that of most painted roofings of less weight and durability.

Sample free on request.

Address our nearest office.

Everjet Elastic Paint

A lustrous carbon black paint, very cheap, very durable—for protecting all kinds of metal and wood work.

Creonoid *Lice Destroyer and Cow Spray*

A powerful disinfectant for farm use to make the hen house and cattle barn sanitary. Suppresses odors, kills germs.

TALK TO TEN THOUSAND FARMERS for a few cents a day, through a little "Want" Ad. in The Maritime Farmer. Think of it! Try it if you have any live stock, farm produce, lands or machinery you wish to sell.

Was Terribly Afflicted
With Lame Back.
Could Not Sweep The Floor.

It is hard to do house work with a weak and aching back.

Backache comes from sick kidneys, and what a lot of trouble sick kidneys cause.

But they can't help it. If more work is put on them than they can stand it is not to be wondered that they get out of order.

Doan's Kidney Pills are a specific for lame, weak or aching backs and for all kidney troubles.

Mrs. Napoleon Larmour Smith's Falls, Ont., writes:—"I take pleasure in writing you stating the benefit I have received by using Doan's Kidney Pills. About a year ago I was terribly afflicted with lame back, and was so bad I could not even sweep my own floor. I was advised to try Doan's Kidney Pills, which I did, and with the greatest benefit. I only used three boxes and I am as well as ever. I highly recommend these pills to any sufferer from lame back and kidney trouble."

Doan's Kidney Pills are 50 cents per box or 3 for $1.25, at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

When ordering direct specify "Doan's."

Sore Shoulders.

Sore shoulders on horses are the result of carelessness, neglect or indifference, and there is no excuse for them on any score. Every spring brings the usual crop of sore shoulders on horses that were turned out for the winter or allowed to get so mushy from lack of work that they are not in condition to stand the spring grind. Take a man out of an office after a winter of ease and stick him between the handles of a walking plow and the chances are that he would be pretty sore for a while. While a horse will not soften so quickly as a man, he will invariably go back if not exercised. The average man will not wear an ill-fitting collar although he does not have to pull a load with it. Yet he will ask his faithful horse to tug on a misfit without the slightest compunction. The constant pressure of a collar on the muscles of a horse's shoulders when the horse is working has a tendency to harden and lessen the bulk of the muscles. While a collar may fit an animal all right at the commencement of the season, it will in time become too large and if a sweat pad is not added, the rolling motion of the collar will soon cause sore shoulders. The collar should have a fair amount of spring and a smooth, even surface and should conform to the horse's shoulders. Both collar and sweat pads should be kept clean. It is advisable to remove the collar during the noon spell and wash the shoulders with cold salt water, wiping them dry afterwards. This should also be done at night. Lifting the horse's collar forward while the animal is resting in the field and giving the shoulders a rub down to remove any granulations of dirt that may have accumulated will also afford relief. The mane should be looked to and the hames should be adjusted so that the line of draft is changed a little every day. If the slightest soreness is apparent on the lower part of the shoulder, the hames should be raised so that the sore portion may be relieved of draft. A short collar is an abomination. The collar should be loose enough to permit of the hand being passed between it and the throat and allow the fingers ta b? thrust all the way around the sides of the neck. It should fit snugly without being too loose. Washing the shoulders with an astringent such as tannic acid toughens the skin and lessens the action of the sweat glands. Bathing with cold salt water is very beneficial. When the horse's neck becomes sore seek the cause, correct it and aid nature in effecting recovery. Various remedies for sore shoulders are used, such as zinc oxid and white lotion. The dusting of air slacked lime or sulphur into the sore after the application of the lotion brings good results.

Value of a Famous Bull.

No, it is not evidence of insanity nor that a man is merely a rich fool when he pays a long price for an admittedly good breeding animal in this age of progress. Some may have thought so when in 1906 Col. A. M. Bowman, a Virginia Jersey breeder, paid $10,000 for the bull Eminent, 2nd, at the Cooper sale for that year. But listen to Col. Bowman. He writes to the Jersey Bulletin that since owning Eminent 2nd he has sold sons and daughters from him amounting to a total of $57,000 and has twenty of his daughters still on hand. And Eminent is still busy. Of course, we can't all buy $10,000 bulls, but nine out of ten dairymen are losing money by not breeding to a better bull than the one that they have at the head of their herds.—Pacific Dairy Review.

Protection against the elements.

Government statistics show that many million dollars' worth of property is lost every year due to the neglect of painting. Rain and storms of all kinds wear out unprotected buildings in 20 years, which, if painted at regular intervals, would last 50 years. Is your property protected with good paint? You can double the life of your building by covering it every three or four years with a good paint. You must be sure, however, to get a paint that you know is reliable. Cheap paint in the long run is expensive, for it will not protect the surface; it soon powders or peels off. Good paint is economical, it covers more surface, looks better and lasts longer than cheap and shoddy paint. There is an S-W Paint and Varnish for every use. Ask your dealer for color cards and full information.—*The Little Paint Man.*

Preventing Growth of Horns

A subscriber recently asked for information on the method of dehorning cattle. Doubtless the most satisfactory way to handle this proposition is to prevent growth of the horns as soon as the buttons make their first appearance on the young calf's head. This will usually be at the age of from one to two weeks. Clip away the hair around these little buttons and apply caustic potash. This material can be purchased in any drug store in the form of sticks or little sharpened pencils, and is conveniently used in this form. Wrap the part held in the hand in paper, so that it will not come in contact with the skin. Moisten the point of the pencil, or better still, moisten the calf's skin where the potash is to be applied, and rub the place vigorously with the potash. The rubbing should continue until the skin shows distinct signs of irritation, and every portion of the growing horn should be touched. If this is done at the proper time in nearly every case absolutely no horn growth will ever appear.

Care should be taken to prevent the potash spreading over the calf's head, or, in case of rain, from running into its eyes. A good way to guard against this is to inclose the spot where potash has been applied with a circle of grease. This little treatment can be applied by anyone very cheaply and with little trouble. There are a number of other substances which may be used with a certain degree of success, but the potash treatment is equally effective and has fewer disadvantages than any other method.

The removal of horns from growing cattle is a comparatively simple operation and is performed in a number of ways. At the present time there are a number of dehorning instruments which have proved pery effectual, most of which are some form of clippers which will cut the horns off close to the skull of the animal at one single, swift operation. Clippers and other dehorning instruments may be obtained from any dealer in veterinary supplies, and may frequently be found at hardware stores. Complete instructions for use usually accompany them, and the average farmer or cattleman will find little difficulty in dehorning cattle if he provides a secure place to hold them and plenty of help.

Capillary Attraction.

Take a lump of sugar and by means of a knife scrape a quarter of a teaspoonful off from one side. Then put these shavings on top of another lump. Dip the lower end of this lump into a glass of water and allow the water to ascend up through it of its own accord. This illustrates capillary attraction and the way water rises from the subsoil up into the surface soil. If you observe carefully you will find that the water does not rise up into the loose sugar on the top of the lump. On the other hand, the fine sugar remains dry. This sugar on top corresponds to a soil mulch. The reason the water does not rise up into it is that the particles are not close enough together to admit of the water rising by means of capil,ary action. The same is true of a dust mulch on top of your soil. This illustrates why it is a good plan to get a layer of loose soil on top of your land as early in the spring as possible, and especially so in a year when we cannot afford to lose a single pound of moisture from our fields if it can be avoided.

Ruberoid Roofing

Trade Mark Registered. Pronounced RUE-BER-OID.

Makes a One-Piece Roof

Water can't "back up" through a RUBEROID roof, for there's not a crack in it anywhere. The Ruberine Cement which goes between and over the joints makes the seams as tight and strong as any other part of the roof.

Easily laid — absolutely water-tight —weather-proof —strongly fire-resisting—RUBEROID Roofing has given perfect protection for years after its imitations have had to be replaced.

Ask your dealer to show you a sample of RUBEROID that lay 17 years on a foundry. Or write us and we will mail you a sample, with our straight-fact Booklet G on Roofing.

Satisfactory Treatment for Bloat.

During the early summer months when cattle and sheep are turned to clover there is considerable danger from hooven or bloat. This usually occurs in animals that are weak or ailing or are underfed, if they are turned on rich pasture or are given an abundance of feed of any kind. Clover either red or white, or alfalfa especially when covered with dew or frost, seems to be the most dangerous. Even alfalfa hay sometimes causes trouble. Partially ripened grain, however, is frequently the cause of bloat, and frosted potatoes or turnips, either roots or tops, have also been responsible for this disease. An overloading of the stomach with sour fodder is bad, and sometimes results in severe cases of bloat.

The symptoms are very plain. The body swells and this swelling often arises above the level of the hips and backbone, becoming tense. It is quite elastic and drum-like when pressed upon. There is great trouble in breathing, the nostrils become distended, the eyes are bloodshot, the mouth hangs open. Occasionally gas comes out through the mouth, and as the swelling increases there is danger of rupturing the diaphragm.

The most common remedy is to pass a hollow probang into the stomach through the mouth. This can be bought of all houses supplying veterinary instruments. Every farm which supports live stock should have a probang. Very frequently, however, the case is so urgent that the animal will die unless the gas is removed immediately. In this case the paunch must be punctured. A good pocketknife is often used with good results. The most suitable instrument, however, and one that costs very little, is the trocar and cannula, at least 6 inches long. The cannula is a hollow tube into which the pointed instrument fits; in other words, the cannula surrounds the trocar. When in this position the combined instrument can be plunged through the skin on the right side about half way between the point of hip and the last rib. The trocar is removed and the cannula remains in place and permits the gas to escape. The cannula may be tied in place and left for hours or even days, until the trouble has entirely disappeared.

If a pocketknife is used, a large quill may be inserted and held in the position until the gas has escaped. After the gas has been removed, a good dose of physic should be given in order to remove the food which, fermenting, caused the trouble. A good dose of sulphate of soda or of ginger answers very well.

The Canadian Holstein-Friesian Association and the Canadian Ayrshire Breeders' Association are making strenuous efforts these days to push their respective breeds. A recent development is the formation of county or district associations, affiliated with the parent organizations Two of these local organizations have been formed by each association in Eastern Ontario the past winter and judging from the enthusiasm displayed by the local breeders, these local bodies are destined to become very effective forces in promoting their respective breeds of cattle. Already banquets have been held at which the quality of the breed represented have been brought right to the front. Regular monthly meetings are held, arranged at different points so as to cover the districts represented pretty thoroughly.

$3,600 in Cash Prizes for Farmers

ARE you going to build that new horseblock, sidewalk or dairy house of cement? Then insist on your dealer supplying you with the "CANADA" Cement. Not only will this ensure your getting a pure, uniform and strictly high-grade cement, that will guarantee the lifelong permanency of the thing you build, but it will also entitle you to enter our Prize Contest. And in this contest you stand a good chance of winning a prize that will perhaps more than pay you for the cost of the work. Every farmer in Canada who uses "CANADA" Cement is eligible to compete. Four prizes will be awarded in each Province and these prizes will be divided as follows:

PRIZE "A"—$100.00 to be given to the farmer in each Province who will use during 1911 the greatest number of barrels of "CANADA" Cement.

PRIZE "B"—$100.00 to be given to the farmer in each Province who uses "CANADA" Cement on his farm in 1911 for the greatest number of purposes.

PRIZE "C"—$100.00 to be given to the farmer in each Province who furnishes us with the photograph showing the best of any particular kind of work done on his farm during 1911 with "CANADA" Cement.

PRIZE "D"—$100.00 to be given to the farmer in each Province who submits the best and most complete description, of how any particular piece of work shown by photograph sent in, was done.

Notice how we have purposely planned and imposed certain necessary conditions in order to give large and small users of cement an equal opportunity.

As an illustration of this: In prizes "C" and "D," the quantity of cement used has no bearing whatever on the result. The farmer who sends us the best photograph of as small a thing as a watering trough or a gate post, has as much chance for prize "C" as a man who sends a photograph of a house—and the same applies to prize "D."

Don't hold back from entering because you think you don't know anything about concrete work. It's very simple. Besides, we have a 160-page book that we will send you free on request, which tells you all about concrete and how to make and use it. In this book, you'll find complete instructions for the making of almost everything you can think of in the way of farm utilities, floors, vats, troughs, stairs, posts, etc.

This free book—entitled "What the Farmer Can Do With Concrete"—will not only inform you—it will also greatly interest you. So send for it anyway, whether you intend to try for one of the prizes or not.

The Canada Cement Company, Limited, Montreal, Que.

On a Solid Foundation.

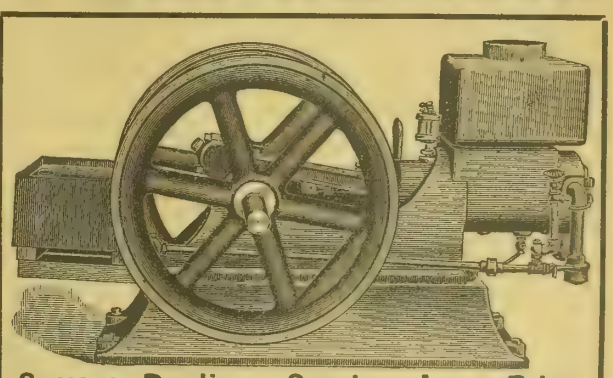
The one solid foundation if business success is **Square Dealing, Service, Efficency, Quality, Price and Durability.**

The success achieved by the **Waterloo Boy Gasoline Engine** is built upon this solid foundation.

The **Waterloo Boy** has been on the market for 18 years. During that time the engine has never failed to make good. For 18 years the makers have kept every promise ever made to the public. They have never failed to live up to their advertising and to sustain their guarantee. The record of **The Waterloo Boy** is a record of satisfaction because it is a record of square dealing.

THE WATERLOO BOY

is the simplest gasoline built. A boy can run it as well as a man. One of the special features of the **Waterloo Boy** is the **Speed Lever,** which works like the throttle of a locomotive. You can vary the speed while the engine is running from 50 to 75 revolutions per minute.



Square Dealing, Service, Low Price, Durability, Efficiency, Quality, Making Good for Years.

Our patented **Mixer** does away with the pump and secures economy in the use of fuel. The old reliable **Fly Ball Governor** is sensitive and keeps the speed steady.

Our improved **Igniter** is as simple as a pair of scissors, it never misses.

Your local agent is our representative to help you if you need help and to see that you get satisfaction, and this without extra charge. **Waterloo Boy** engines will cost you less than other engines and you have this service thrown in.

What shall we say of the price? Simply this—we name the **Underselling Price.** How can we do this? Because of the simplicity of our engine, the large volume of our business and our well equipped factory. The fact that the makers specialize on engines only enables them to build them cheaper than others.

FARM AGENTS WANTED. Because of the above facts the **Waterloo Boy Gasoline Engine** is the right one to take out an agency for. Our Square Deal protects the agents. We have an attractive proposition to make you. Write me to-day.

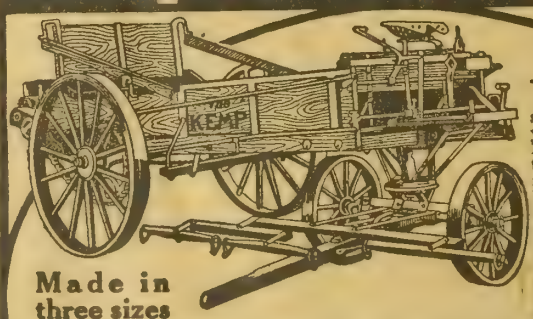
Inside Facts About Kemp Manure Spreaders



Strong Where Others are Weak

YOU who continue to spread manure over your land by hand, learn how it is possible to cover three times as much ground with less labor and increase crops 10 to 15 per cent by using the Kemp Manure Spreader.

This spreader is the result of 39 years' experience in building spreaders of all kinds. It is the first one that will handle all sorts of material, thoroughly pulverize and distribute it evenly, and has one-third lighter draft than any other spreader ever built.

The secret of the wonderful success of the Kemp Manure Spreader lies in the Flat Teeth used on the Cylinder Bar. Because these teeth are wide and graded, we need only have one-third as many used on other machines. This does away with the manure backing up and clogging, reduces friction on the cylinder—and correspondingly lightens draft.

The machine is also equiped with the strongest and most practical change of feed ever put on a spreader, while the Apron has a friction return so the operator has it always under control. The Kemp Manure Spreader will economize labor more than any other farm implement and, by increasing the fertility of the land, will pay for itself in no time.

Settle your doubts, once and for all, concerning what kind of a spreader you want on your farm, by writing for our free book B 75 which tells the inside facts about Manure Spreaders. Write today—address,

SIXTEEN MONTHS ON CRUTCHES!

NOW COMPLETELY CURED

PERTH, N.B.

"I am writing this to let you and sufferers from Rheumatism know of the wonderful benefits I have derived from GIN PILLS. For two years, I was an invalid, incapable of work of any kind. For sixteen months, I was unable to move without the assistance of a crutch and cane. I was treated by our best doctors as well as taking treatment from a specialist in Chicago. I did not improve and had about given up hope of ever being well again when a friend advised me to try GIN PILLS. This I did, and with a two months treatment was a well man again. This was four years ago and I have had no return of my trouble since.

I still use a box or two of GIN PILLS a year, just as a preventative and am enabled to go fishing and shooting in the spring and fall, and lie out on the ground at night, without any inconvenience.

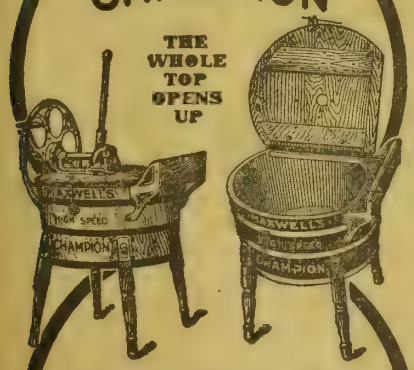
GIN PILLS are a wonderful medicine and I take great pleasure in recommending GIN PILLS to all sufferers from Rheumatism, for I have no doubt that if they will persist in the treatment, GIN PILLS will do for them what they have done for me".

ALEX. W. STEVENSON.

GIN PILLS are sold by all dealers at 50c. a box—6 for $2.50. Sample free if you write us. National Drug and Chemical Co. Dept. M. F. Toronto.

National Lazy Liver Pills are just what you need if the bowels are "tight" or the liver torpid. They act gently but surely. 25c. a box. 65

MAXWELL'S HIGH SPEED CHAMPION



We've made it easy to put clothes in and take them out.—The "Champion" has the largest opening of any washer. This one improvement alone is worth the price. There are a dozen others that mean quick, easy washing.

A Thirsty Plant.

It has been estimated that it requires 522 pounds of water to grow each pound of dry matter in the oat crop. With a 45 bushel crop there is something over a ton and a quarter of dry matter, depending of course on the length of straw. It has been estimated at another station that it requires 11 inches of rainfall for each ton of oats and straw to replenish what evaporates from the soil and through the growing crop.

Here is the situation. The oats are the more thrifty growers and get the start of the clover. They practically keep the clover down until after harvest. In their rapid growth they take up tons of water. A young plant loses more water than a mature plant does. It therefore needs a constant supply. As was said before, loss of water depends upon the weather. In early spring the soil is moist, the weather cool, the atmosphere incapable of taking up very much water. Hence the supply for both clover and oats is sufficient. But as hot dry weather comes on, as the oats begin to mature the supply of water is greatly taxed. The oats having the start rob the little clover plants.

It requires more water from blooming to ripening of the seed than at any other time. The oats draw heavily on the water supply at a time when the clover plants are losing most through transpiration.

The oats are cut, the clover scorched by the sudden removal of back that it may not recover MMM its shade, and the clover gets a setback that it may not recover from.

The way to succeed with a nurse crop for clover or alfalfa is to sow very lightly with the oats or barley then take that crop off before it be-

Red Rose Tea is so popular because "it's good tea" and because when you buy a package you have the comfortable feeling you're getting an article fully worth every cent you pay for it. 62

gins to mature. Cut it for hay at blooming time, and cut as high as possible, and you can thus have success with a nurse crop.

If seeding alfalfa in August don't us a nurse crop. The season is so advanced that little rain will fall, much has been taken from the soil and the chances are that the alfalfa alone will need every bit of rain that is available.

Making Good Use of Skim Milk.

As regards the feeding of skim milk in order to secure the best results from its use, experiments along this line have been conducted at the various experiment stations. At the Central Experimental Farm at Ottawa, considerable work has been done in this connection. In commenting on this work, Mr. J. H. Grisdale says:

"Skim milk is often fed by our farmers too lavishly. They have a considerable quantity of it and have few pigs, and therefore the pigs receive all they will drink—sometimes more. I have seen farms where there was skim milk standing in the troughs all day. This is not only extravagance, but wilful waste. If we are to make the best use of our dairy products, as we should, there is no better way to use them than for bacon or pork production. But if we are going to use them at a profit, we must use them economically.

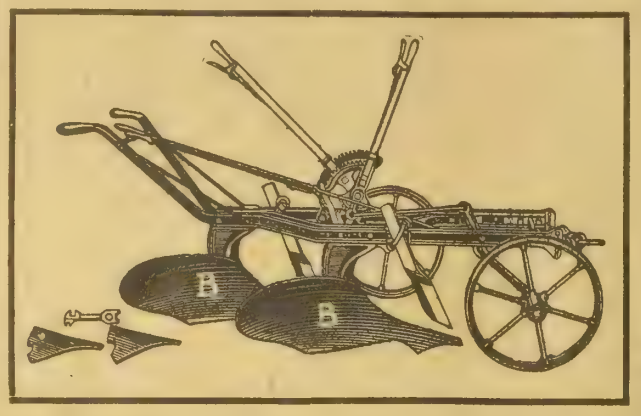
"A series of experiments was conducted at the Experimental Farm some years ago to determine the amount of skim milk that was most profitable to feed to young pigs. To some we fed as high as 30 pounds a day—all that they could possibly drink, and they received hardly anything else; and to others we fed as low as two pounds a day. We kept account of the amount of milk that each lot was fed. We valued the skim milk according to the results it had when fed along with the meal, and the results obtained were as follows: Where we fed 30 pounds a day of the skim milk—all they would consume in addition to a small amount of meal—the milk was worth about eight cents a 100 pounds. Another lot received 25 pounds a day, and we found that the skim milk was worth 10 cents a 100 pounds. Other lots got about 20 pounds of skim milk a day. Where we fed 20 pounds a day the skim milk was worth about 12 cents a 100 pounds. When we fed 15 to 18 pounds, was worth 15 cents. When we fed from 10 to 12 pounds, we got a little over 20 cents. When we fed eight pounds, we got 25 cts. When we fed from four to six lbs., it was worth over 30 cents a 100 lbs. Where we fed from three to five lbs., it was worth a little over 40 cts. Now, you see the wonderful increase in value that the skim milk underwent when fed in small quantities.

"Skim milk is valuable not only as a feed, but it acts as an aid to digestion, or helps to digest other feeds, and makes them more valuable. Where we fed meal alone, it cost us $4.50 for 100 pounds of bacon; where we fed skim milk with it at the rate of, from three to five pounds a day, valued at 50 cents a 100 pounds, it cost us only $3.50; and where fed in addition a small amount of roots it made the cost even less. The farmer who feeds his pigs all the skim milk they can possibly drink is extravagant and wasteful."

A touch of rheumatism, or a twinge of neuralgia, whatever the trouble is, Chamberlain's Liniment drives away the pain at once and cures the complaint quickly. First application gives relief. Sold by all dealers.

This Two-Furrow "B" Plow Will Cut Your Plowing Right In Half

WITH two horses and this Two-Furrow "B" Plow, one man can do as much work in a day as two men and four horses can do with two ordinary walking plows. That's in stubble land; even in sod, you need only one extra horse — and save a horse and a man.



Now, note the special, improved features of this time-saving plow; it has a high lift to facilitate transportation; the standards are very high to prevent clogging in stubbles; the frame is made in three sections and very strongly braced, there are double adjusting levers — very long and very handy; there is a straightening lever to adjust width of furrows; the wheels have roller bearings in sand-proof hubs—the draft is reduced by half; the clevis is adjustable for two or three horses; the mouldboards are tempered as hard as glass — soft-centre steel—light draft and always clean; rolling colters when desired. The total weight is only 325 pounds! We would like to tell you more about this plow and other "B" Plows. **If your dealer cannot supply you, send us your name and address and we will give you the full information. Write to-day.**

The disc drill that can't stall

ANY disc drill economizes seed, time and labor as compared with other ways of seeding. But a FROST & WOOD CHAMPION excels all in accurate sowing, money-saving and the certainty of bigger crop-production. It sows right under hardest conditions.

Built with more strength than it will probably ever need. Continuous steel axle from wheel to wheel, with frame and seed-box solidly attached. Seed-box down low and easy to fill. Tested indexes tell just how much you are sowing. Champion does not compel you to fit the shift-lever precisely into such-and-such a notch. Vary the seed-feed to suit yourself—do it in a second. Champion disc hubs are really dustproof, and are fitted with ball-bearings same as a good automobile. Direct down-pressure on EVERY disc-hub avoids side-strain. No neck-weight on team.

Macdonald Agricultural College praises its CHAMPION DRILL. So do the Experimental Farms throughout Canada Profit by their experience

Dairy Record Centres.

The Dairy Commissioner's Branch at Ottawa has undertaken a new line of work this season that promises to add greatly to the knowledge of cow keeping. This work consists in placing competent men in charge of the small dairy districts to gather data, as to cow returns at cheese factories and creameries, the cost of feed and the profits which farmers are making from their cows. Meetings will be held, information given in breeding and feeding cows, and assistance rendered in other ways in improving the quality and in increasing the quantity of dairy products produced. But the chief work will be to raise the standard of the individual cow and to show dairymen the folly of keeping unprofitable animals.

These centres will be known as Dairy Record Centres. Two have been established in Ontario this year, one at Woodstock, and the other at Peterboro, besides two in Quebec. If the work proves successful, more will be established next year. The intention is to keep a dairy record centre going so long as it can be shown to be useful to the dairymen of the district and there is information of value to be obtained. A thorough study of dairy conditions in one district year after year cannot fail to bring forth a lot of valuable information about cows and cow keeping that will be useful to dairymen everywhere.

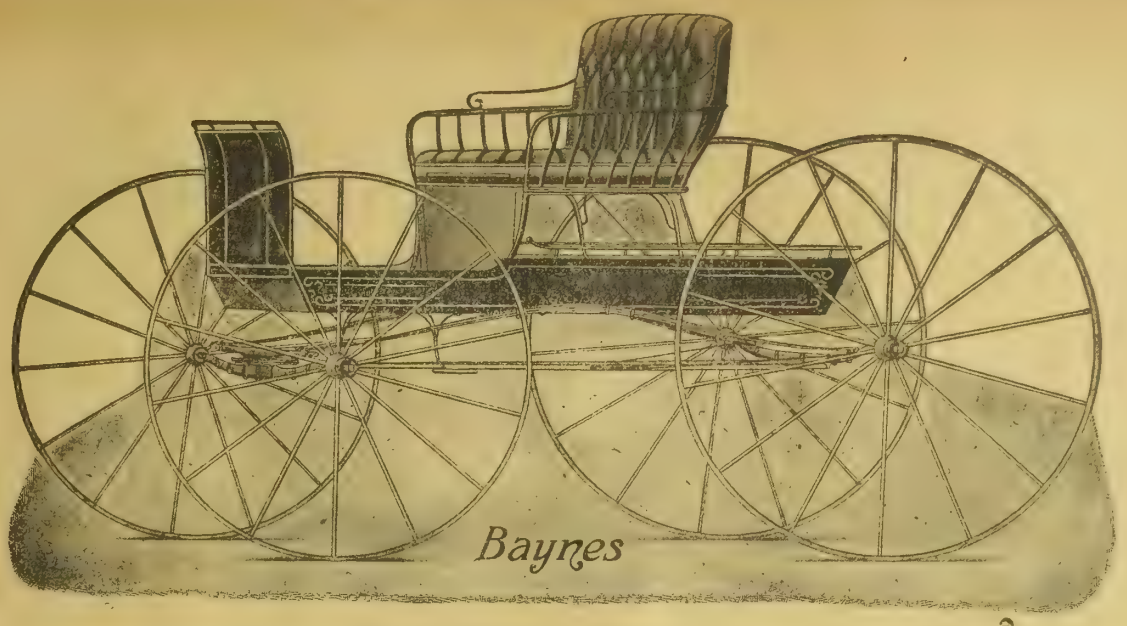
Low Prices for Skins and Hides.

Whereas the market for raw hides and skins in Germany was fairly satisfactory during 1909, the state of affairs was not so favorable in 1910. Most raw material reached a price at the end of 1909 that prohibited large stocks being kept, and the stock in hand at the beginning of the year under consideration was exed as long as the chief buyers, both home and foreign, were compelled to cover their chief requirements. As soon as this had been done prices receded rapidly, and the year closed with very low prices.

The influence of America, and the dependency of United States markets was unpleasantly felt throughout the trade during the year, more especially as owing to the economical depression prevailing in the United States and the deficiency in supply, dealers were compelled to sell the higher this year than last, United prices in 1909 at a considerable loss. As prices for raw material were higher this year than last, Unit?d States manufacturers of dressed leather restricted their output, and manifested a certain reserve in buying raw material, thus exercising a pressure on the prices. This was mainly felt in calf and sheep skins, and all the more so, as the export of finished glove leather to America ceased entirely at times, so that German glove makers were very cautious in buying sheep skins.—Trade and Commerce Review.

Heat, Energy and Fat.

Protein, starch, fat, sugar and fibre are the nutrients that make up foods. Protein is the only one from whirh muscle and tissue can be made. The others serve to produce heat, energy and fat. Starch and sugar are about equal in food value. mhe fibre in the plant cut green has the same food value as starch. Fats serve the same purpose in the animal body as starch, but are more concentrated, having 2¼ times as much nutrient in a given weight.



No. 578—PROVINCE ROAD WAGON.

New and unique in style—light in appearance and in reality—this makes a very "nifty" little rig It's easy on the horse, and exceptionally comfortable for the driver, for it's hung on those long, easy-riding E. T. Springs. If you like this type of a wagon you'll find the "Province" more than satisfactory.

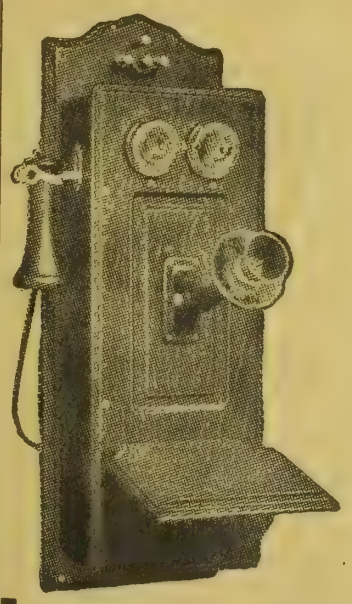
The Independent Telephone Movement is a Huge Success.



Four years ago there were only about 75 independent telephone systems in Canada. To-day there are over 400, with a combined capital of $2,500,000. That is your proof of the huge success of the Independent Telephone Movement.

But notwithstanding the immense increase in the number of telephone systems, the country is still in need of more telephone service. Canada has but one 'phone to 179 inhabitants, whereas the United States has one 'phone to 16.

Perhaps your locality is one of those that does not enjoy the benefits of the telephone. But of course it is only a short time before it will be classed with other up-to-date telephone-served districts. It only needs some one "to start the ball rolling." Let that person be you. You'll gain prestige by doing so. We will help you.

CANADIAN INDEPENDENT TELEPHONE CO., LIMITED

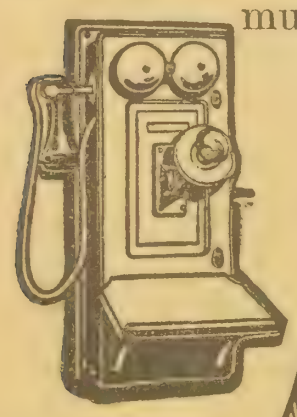
1820 Duncan St., Toronto, Ont.

Make a start now by sending for our book, "Canada and the Telephone." It contains some information of what has been and is being done.

WE SEND THIS 100-PAGE CLOTH-BOUND VOLUME SEND US THE COUPON TO-DAY

FREE

YOU only need to tear out the coupon, fill it in and mail it to us to get this book. "How to Build Rural Telephone Lines" is a stiff-covered, cloth-bound book of 100 pages, crammed full of hard facts about the building of community-owned telephone lines. There is no theory—no clever writing in this book. It is full of nothing but actual facts. It tells the facts about the organization of numerous rural telephone companies and the success they have achieved, the facts you need to know to organize such a company in your own community. The facts about mutual-company organizations and about stock-company organizations, the facts about practical construction work and how you and your own neighbors can do this construction, the facts about the equipment necessary, the facts about government regulations on the matter—in short, it tells you every fact you need to know, from the moment you dream of the possibilities of a telephone system in your community, until the line is actually erected and you are able to talk over it. This is the most complete book of its kind ever published anywhere; it is the one single volume in existence that gives the farmer every detail of information he requires to organize a telephone company and construct a rural telephone line from start to finish.



You owe it to yourself to know all there is to know about rural telephones. Farmers all over the Dominion are organizing companies of their own; if such a company does not already exist in your locality, it is only a question of time until one will be formed and meantime, you should be becomin possessed of the facts.

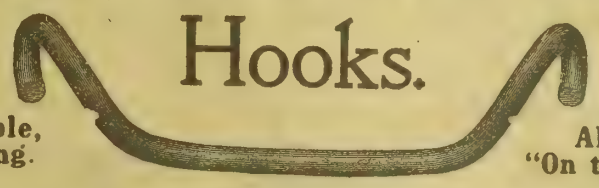
Page Galvanized Fence Hooks.



Simple, Strong.

Always "On the Job."

Here's a big fencing convenience—Page Galvanized Fence Hooks—for fastening wooden pickets ¾x1 ¾ on wire fences. Page Hooks are perfectly made, so there's no waste. We have, also, tools for applying hooks. At your service, also, Wire Locks, Wire Stays and Tools for same. Write us. (Address at top of this advt.)

YOU Can Furnish Your Home FREE!

ANY housewife buying goods at the stores mentioned below may have their cash purchases apply on **Asepto Soap Premiums.** Every cent you spend counts toward a premium. A sure and mighty convenient way to save without increasing living expenses. Over 300 premiums of honest value to select from. The list will be increased every few weeks. Furniture will be offered next. The old way was to allow premiums to apply on Soap Wrappers only. Now at any of these stores—no matter what you buy—everything has its equivalent in Soap Wrappers. That is every five cents spent counts the same as one wrapper, while purchases of our goods as here advertised entitles you to two coupons—the one the merchant allows and the ones found in or on our goods themselves.

Dr. White's Honey Balm.—A cough syrup that is safe and sure. We are positive that no other cough syrup equals it. Price 25c. Equal to 5 soap wrappers.

Pendleton's Panacea.—The best hot medicine, in use nearly 100 years. Every person knows it is good. Price 25. Equal to 5 soap wrappers.

Brown's Cutilive.—A witch-azel cream for chapped hands, sunburn, etc. Price 25c. Equals 5 soap wrappers.

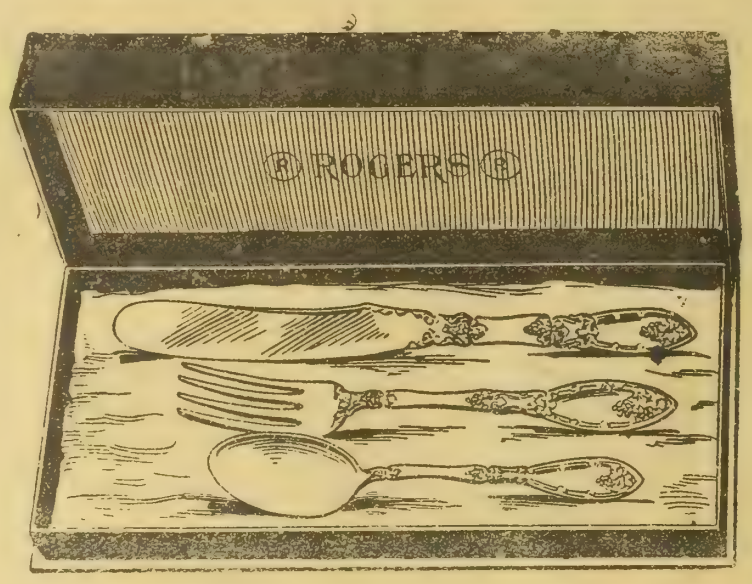
Scott's.—Salts, Senna, Sulphur, Saltpetre, Borax and Alum in 5c packages. Equal to 1 soap wrapper.

Brown's Spearmint Tooth Paste—Sweetens the breath, prevents decay, hardens the gums and whitens the teeth. Price 25c. Equals 5 soap wrappers.

Napatho Soap.—A pure laundry soap, containing naptha and incorporated by a process that prevents it from hurting the hands, as other Napatho Soaps do. The wrappers count for Premiums.

Sapid Tea.—A blend selling at 40c, in 1 lb. packages only. Blended by J. Harvey Brown, one of the most competent tea men in Canada. Each package carries a coupon equal to 8 soap wrappers.

Dr. Scott's White Liniment.—The largest bottle and best liniment. Price 25c. Equal to 5 soap wrappers.



Banner Flavoring Extracts.—All flavors and from 10c to $1.25 per bottle. Coupon on each bottle.

Herner's Dyspepsia Cure.—The only kind that tells you to eat what you like while taking it. Money back if not good. Price 35c. Equal to 7 soap wrappers. Price $1.00. Equal to 20 soap wrappers.

Brown's Stomach and Liver Pills.—A good family pill. Price 25c. Equals 5 soap wrappers.

Scott's Furniture Polish.—Renews the life of old furniture. Price 25c. Equals 5 soap wrappers.

Asepto Soap.—Is equal to the best and contains the same anti septic features that Asepto Soap Powder does. The wrappers count for premiums.

Scott's.—Nitre, Glycerine, Iodine, Iron, Squills, Friar's Balsam, Carbolated Oil, Camphorated Oil, Castor Oil, Sweet Oil, Oil of Tar, Sewing Machine Oil, Spirits of Camphor. Price 10c per bottle. Equal to 2 soap wrappers.

Scott's Fruit Syrups and Lime Juice.—Pure and excellent flavor. 10c, 15c and 25c. Coupon on the bottle.

Ebony Polishes—None better, both paste and lustre. Coupon on each box. Try them.

Banner Spices.—In packages only. Absolutely pure. ¼ lb. packages carry coupon equal to 2 soap wrappers.

Venus Floating Soap.—Made from pure vegetable oils and unexcelled for the toilet and bath. Price 25c. Coupon counts for premiums.

Asepto Soap Powder.—Has been the greatest success of any soap or powder ever put on the market. This is the best evidence of its quality. It is antiseptic as well. It absolutely sterilizes every article washed. Think what this means to a family. Price 5c, and the trade mark counts for premiums.

The following stores are now in a position to explain to you what this offer means :—McLeod & Spence, Port Elgin, N. B.; F. L. Rayworth, Bayfield, N. B.; W. H. If you are thinking of buying either of the above, it would be as well for you to write us now and get quotations, so that we may have them ready for immediate delivery when you want them.

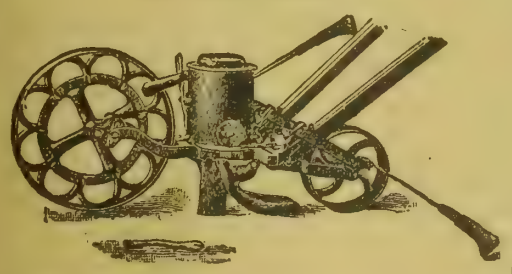
GARDEN SEEDERS
"The Handiest Implement on the Farm."



This machine has a marker for each row, makes the drill and covers the seed as you go along. It is arranged so that by turning a disc any sized seed may be sown accurately. 200 in stock, ready for shipment. Write for picture showing details of this handy machine.

Our line of Plow Castings is complete and are suitable for any of the different makes of Plows.

Our "Star" Feed Boiler is built to suit your requirements. It is the Boiler you should use if convenience and economy are of interest.

The Sussex Manufacturing Co., Ltd.,
Sussex, - N. B.

HOLMAN, "The Gypsum Man."

Sells Gypsum Direct to Farmers and Farmers' Clubs.

Gypsum (Land Plaster) stops the tremendous waste that annually occurs in your manure heaps; use it liberally in your stables and help to keep them in a sanitary condition; sprinkle it on your potato sets and it will keep them without shrivelling and in a vigorous condition for growth, even if they are cut a long time before they are planted; use it on your dry soils to conserve moisture and on your wet soil to help sweeten it.

Gypsum is cheaper than lime and has a more favorable effect on the soil, as it does not liberate the stored up plant food in excessive quantities.

I have installed a plaster mill and am now prepared to grind Gypsum at my Sussex quarries. Write me for prices on car, ton or hundred weight lots. It would be extravagance to farm without using Gypsum when I can quote you such low prices.

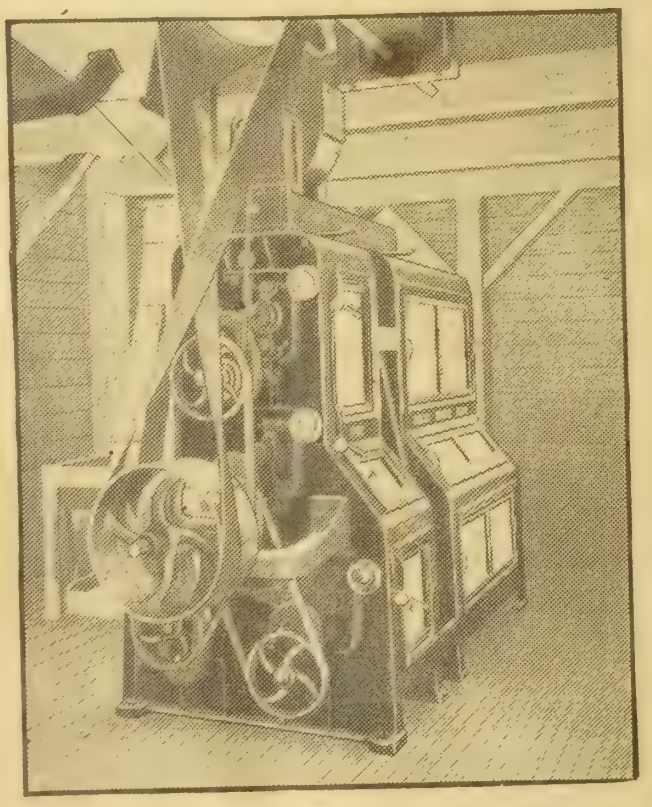
THE MIDGET FLOUR MILL.



VIEW OF MIDGET MILL INSTALLATION.

A machine for small Country Flour Mills. Produces flour equal to the largest mills. Requires small floor space and takes little power to run. It restores the Village Mill to its ancient position. (Send for Catalogue describing operation and giving testimonials.)

CAPACITY AND YIELD

The Midget will grind 4¼ to 4½ bushels of Winter Wheat per hour and 4½ to 5 bushels of Spring Wheat. The yield varies slightly with the class of wheat milled. Speaking generally, the mill will make a barrel of flour from 280 lbs. of wheat. The actual percentages of flour obtained from the wheat can be varied by the operator.

A	B	C
71 lbs. straight run flour. (All one quality)	51 lbs. good baker's flour.	54 lbs. fine flour.

Spring Butter Defects and How to Avoid Them.

By C. A. Publow, M. D.

A NUMBER of our creameries and private dairies manufacture butter during the entire twelve months of the year, but the great majority close operations during the cold winter months. In the spring of the year, when the cows come in and before the cheesemaking season commences, milk soon accumulates rapidly, and the make of butter increases in a short time to such an extent that the market quotations drop and the butter market is reported as weak, slow, quiet or some other similar conditions. Therefore, in the spring all butter makers, both in creameries and on the farms, must use all their skill and carefulness, because with the increasing supply of butter and the decreasing market prices, buyers are more particular and notice defects, which, during a firm market, would pass unnoticed.

Spring butter is liable to nearly all the defects common to butter at other seasons, but there are a few serious ones which are more frequent at this season and which can be largely prevented by due care. Probably the most common of these defects is that of "old" flavor. In the spring the milk delivered at the creameries is not sufficient in quantity to produce enough cream so that it is worth while to churn every day and on the farms it may be churned every week or longer. In order to prevent the old flavor, therefore, we must consider the question of the best method to preserve the cream in the best possible condition. Some prefer to cool the cream to a low temperature (50 degrees F.) immediately after it has been skimmed or received, then allowing it to stand for one or more days. The second day's cream is then poured in with the first day's cream, the starter added and the ripening process completed. Others prefer to add the culture or starter to the first batch of cream immediately after it has been skimmed, then ripen it to the normal degree of acidity and cool to about 50 degrees F.

A Pair of Beauties.

Feeding, weeding and breeding intelligently will give you cows like this. Note the capacity of these cows. They look good to us.

The next day the new cream is skimmed into this already ripe cream, stirred thoroughly and the ripening process completed. The latter method if done properly has given the best satisfaction. When cream is ripened according to the method first described undesirable bacteria and fermentations are likely to gain control of the ripening process as the undesirable bacteria grow and increase more rapidly at a lower temperature than do the lactic acid producing bacteria. When the new day's cream is skimmed into this the undesirable germs may preponderate to such an extent that the desirable germs cannot overcome or suppress them during the remainder of the ripening process. According to the latter method, the first day's cream is ripened as usual. When the next day's cream is skimmed into this the first lot of cream acts as a starter. The lactic acid present inhibits the growth of other undesirable species and consequently better results are obtained by this method. If possible and all other conditions consistent, it is better to ripen the cream and churn it at least every two days than to hold the cream for several days, or a week. Butter will always keep better than cream under any conditions.

Mottled color is no doubt the next most common defect, and may be due to a number of causes. In the great majority of instances the cause of mottles in butter can be traced to the failure to remove all the casein of the buttermilk in the wash water. In the spring the tendency for all buttermakers is to use too cold wash water, the result being that the granules of butter become hardened from the outside forming a hard covering which prevents the escape of all buttermilk. Apart from the deleterious effect very cold water has on the yield of butter, there is no objection to its use after the buttermilk has been perfectly removed. The first washings or rinsings should therefore be done with water at the same temperature or a trifle warmer than the buttermilk and the colder water used afterwards if necessary to firm the body of the butter. Mottles are practically unknown in sweet or unsalted butter. Salt is the real direct producer of the defective color and the mottles caused by improper incorporation of salt assume two different forms, viz., mottles proper and wavy butter. When buttermilk casein comes in contact with the salt it is hardened and bleached so that it appears in spots of lighter color than the surrounding butter. Whenever there is undissolved granular salt present, the moisture is attracted and the color deepened at that particular place. In case the water has already been saturated with salt there is no danger of mottles, no matter how much gritty salt is present.

Wavy color in butter is due to an uneven distribution of the brine. If a little salt is added to the butter and dissolved without working the butter sufficiently, the salt will go into solution in certain portions of the water. The water containing the greatest amount of salt will produce a high color in certain portions of the butter, while the portion containing water with less salt, will have a lighter color, thus causing streaks in the butter. A common cause of mottles that has recently been demonstrated to the writer is that of placing freshly salted butter in a very cold room. Butter that otherwise has been well made in every way may become very much mottled from this cause. What the exact cause of such a change is we are hardly sure, but it is probably due to the effects of cold in producing a more or less concentrated condition of the salt. In such cases and when butter has become mottled on standing, the mottles can be entirely eradicated by re-working the butter—though some of the moisture is lost in this re-working process. It is usually advisable to re-work the butter rather than to place it on the market in a badly mottled condition. The mottles should, however, be prevented rather than cured.

Gritty butter seems to be especially prevalent in the spring, and it is a very undesirable defect, usually lowering the selling price of butter at least a cent a pound. The term "gritty" butter is used to indicate that part of the salt is present in an undissolved condition. To most consumers this condition of the salt in butter is objectionable. When properly incorporated salt should be present in butter in the form of a solution. The gritty condition of the salt may be due to: 1. Adding so much salt that it cannot be dissolved by the water in the butter. The maximum amount of salt that butter will dissolve depends upon the amount of moisture present. The maximum amount of moisture permissable in butter is 16 p. c. but the condition and distribution of the moisture prevents the water from being saturated with salt during the comparatively short time allowed for salt to dissolve during the manufacture of the butter. 2. Poor condition of the salt before it is added to the butter. most butter salt is of a good grade, but very often farmers and buttermakers buy a cheap grade of so-called fine salt, simply because it is cheaper than the higher grade. That is certainly a mistake and the diffetence is very noticeable in the quality of the butter. 3. Insufficient working. If the butter is not worked enough to distribute the salt evenly, some portion of the butter will contain more than the other por-

tions. The portion that contains the excess of salt does not have enough moisture to dissolve the salt; while if the salt has been evenly distributed in the butter, all the salt would have been properly dissolved. When gritty butter is caused by insufficient working it usually has a mottled color. Butter, of course, must be salted in varying amounts to suit the varied tastes of the many different consumers but when salt is properly incorporated more salt can be added without the taste of the butter seeming as salty as butter with a lesser amount of undissolved salt.

There seems to be a growing tendency for the consuming public to demand sweet or unsalted butter. It is easier to control the moisture content of sweet butter, but if salt is properly incorporated it is possible to increase the overrun two or three per cent. and this means a good deal of extra money to the average creamery. Amongst the more business like creameries, especially those on the American side, during the last year, the incorporation of an increased amount of unnoticeable salt has become of nearly as great importance as the control of the water content. Good business managers have learned to appreciate the fact that salt sold in butter at twenty-five cents a pound yields a good profit. In these up-to-date creameries a salt test is always found in use with the moisture test and while its use means a little more work for the buttermaker, it also means an increase in returns far more than sufficient to pay for the extra labor. It may be of interest to buttermakers to know the method used on the American side for the accurate determination of salt content of butter. It is as follows: Weigh out a representative 10-gram sample or use the butter remaining in the cup after making a moisture determination. Thoroughly wash the butter fat into a glass stoppered pint bottle by using several small portions of hot water. This bottle should then be filled with hot water until it contains 300 c.c. Place the stopper in the bottle and shake the mixture of melted fat and water thoroughly together. Allow the sample to rest until the fat has raised to the surface. Then draw of a 17.6 c.c. pipette full of the watery solution and place it in a white cup, being careful not to allow any of the fat to enter the pipette. Next add from a dropper bottle of a potassium chromate solution. Then slowly run in a standard tenth-normal silver nitrate solution from a graduated burette until one drop, after stirring, changes the yellow color of the mixture to a reddish color. One cubic centimeter of standard silver nitrate solution equals one per cent of salt in the butter and 1-10 c.c. equals 1-10 of 1 per cent of salt. When moisture determinations are being made the additional work of making a salt test is therefore but slightly greater than making a test for the acidity of milk, cream or whey. To prepare the solutions—seventeen and one-half grams of pure silver nitrate dissolved in rain water or distilled water will make 1000 c.c. of standard tenth-normal solution. Five grams of potassium chromate dissolved in water will make 100 c.c. indication of required strength. The test is simple, apparatus is easily secured and should be used by every butter-maker who is desirous of getting the most out of his business.—C. A. Purblow, M. D., in Ottawa Valley Journal.

Fruit Crop Report No 1.

WINTER OF 1910—11.

No losses in Eastern Canada have been reported from winter killing, except in the case of strawberries, and then only from limited areas. The losses reported have been less than for several years. For a number of winters, even when the conditions did not appear unfavorable, fairly serious losses from winter killing have been reported. This was accounted for by the injuries which the trees received during cold series of winters from 1899 to 1904. Apparently normal conditions have been restored, and Canadian orchards are again strong and vigorous. The snow fall was not excessive anywhere, and the orchards have escaped the ordinary sleet storms that nearly always prevail in one section or another.

Spring Weather.— The spring of 1911 is reported somewhat backward, but not excessively so; and in most cases the fruit growers report that this tardiness has been a positive advantage as it is likely to prevent losses from late frosts. Fairly heavy frosts were prevalent the first week in May, but no serious dvmage was reported. The latest reports indicate that rain is now needed in Eastern Canada. In British Columbia serious damage to the peach and cherry crop is reported as the result of frost.

APPLES.

The prospects for bloom this year are excellent. It is too early, of course, to speak except as to the show in bud. The wood growth and bud development during the summer and fall of 1910 was excellent, and close observers predict an excellent show of blossoms, if there are no unfavorable conditions later in May.

District 1. All varieties are reported in good condition, with every prospect up to date of a good crop. Doubt is expressed only in the case of Spies, possibly because these bore fairly well last year.

District 2.—In 1909 a heavy crop was grown in this district. In 1910 the crop was very light, but the wood and tree growth was good. It is confidently expected, therefore, that if favorable conditions of the present time are continued, the crop for 1911 will be good.

District 3.—This district in 1910 had a fair crop of Baldwins and Spies and, though the majority of correspondents report everything favorable up to date, a few have expressed doubts with reference to Spies and Baldwins. The orchards in this district are receiving extra care this year, and many new orchards are coming into bearing.

District 4.—The Fameuse and McIntosh are in excellent condition. Wealthy, Duchess and Wolfe River are showing up well.

District 5 and 7 have had no winter losses and so far as can be judged from the dormant buds have reason to expect at least an average crop.

District 6.—The fruit growers of the Annapolis Valley are particularly optimistic. Though there was an exceedingly small crop last year, the trees were well cared for and made excellent growth. Spraying, pruning, fertilization and cultivation have been practiced as never before. Several new co-operative associations have been formed. Some well posted correspondents express the conviction that the Annapolis and Cornwallis Valleys will produce 100,000 barrels of apples this year.

District 8.—The orchards of Prince Edward Island are receiving more attention this year than ever before. No adverse weather conditions have been reported, but the buds are still dormant.

Districts 9 and 10.—Blossoms have opened well in British Columbia, and for the present a good crop is expected except in late varieties.

PEARS.

Pear trees are in good condition. In the Niagara District they have begun to bloom and the showing is good. The frosts of the last few weeks have not injured them to any extent, and the wood growth of last season is fair. The British Columbia crop promises to be not more than an average one.

PLUMS.

The commercial crop of plums this year will, in all probability, be above the average, if no adverse conditions arise. The crop was rather short last year in many sections, but the trees are in good condition. The black knot, though still present, is not prevalent to the extent of former years, and the tenderer varieties are being gradually eliminated. It is possible thnt the Japan varieties may show up well this year, though slight injuries have been reported from Southern Ontario and British Columbia.

PEACHES.

The outlook in Niagara District is good; the orchards have been well cared for and the weather conditions so far have been favorable. Peach growing is not progressing rapidly in Essex County, is actually declining in Kent, but many new orchards are being planted in Lambton. The crop prospects are only medium, though there are few adverse reports from Lambton county. The British Columbia crop will be very light.

CHERRIES.

Cherries are showing well in all sections. Though the trees are beginning to bloom nicely in the commercial orchards in Ontario, it is too early to speak confidently of the 'set' of fruit.

GRAPES.

Grapes have wintered well. The wood of last year was well matured and vigorous. Fortunately the buds were not far enough advanced to be injured by the recent frosts, and the present indications look to at least an average crop.

SMALL FRUITS.

Small fruits generally have come through the winter well. An exception may be made, perhaps, in the case of strawberries, but this exception applies to only limited areas. The lack of snow and the heavy frosts after the snow had disappeared in some cases seriously injured the strawberry crop. Nevertheless if no further adverse conditions intervene, there will be a large aggregate, as there is an increased acerage this year. New Brunswick has now several large growers, and Nova Scotia is paying much more attention to small fruits than formerly. The indications in British Columbia are for a light crop.

Raspberries and blackberries came through the season particularly well. Very few winter losses were reported anywhere, even on the moderately tender varieties.

Currants and gooseberries are in their normal condition.

TOMATOES.

No large commercial plantings have yet been made of tomatoes, but the plants are doing well in greenhouses, hotbeds and cold frames. The acerage contracted for by canners is somewhat larger than usual.

INSECTS.

No insects are reported as being particularly prevalent up to date. There are, however, the usual number of common pests.

Several samples of Bud Moth have been sent to the Fruit Division, and the Blister Mite is reported over wider areas than formerly.

The Oyster Shell Bark Louse is on the decrease, but is still prevalent in some sections.

The San Jose Scale continues to spread, but very slowly. In districts seriously affected some years ago, large numbers of fruit growers are reporting that they have no difficulty in controlling it with the lime sulphur, and no longer dread its ravages.

Lady Primrose [21495], sired by Baron Primrose; dam, Juliet, by Baron's Pride [9122.]

In writing re this mare, Messrs C. R. H. Starr & Son, Port Williams, N. S., says: 'This mare, bred by ourselves, is two years old this spring She was first in her class at the 1911 Maritime Horse Show, Amherst, and stood reserve female champion. The Snowball horse, which was first in the aged stallion class, over imported horses, the stallion we showed in the three year old class, Baron Majestic, and the above mentioned filly, are full brothers and sisters, out of Juliet, and sired by Baron Primrose. The Snowball horse, Baron Balgredden, is four years old this spring. Baron Majestic is three years old and Lady Primrose two years old. Howard W. Corning, of Yarmouth, has Juliet's first colt, Baron Graham, which is five years old this spring. We still have the old mare, which is due to foal in a few weeks, and also have a colt a year old this spring, which we think is the best one we ever had. When you consider the fact that Baron Majestic was champion; Baron Balgredden reserve male; Lady Primrose, reserve female champion, to one of our own in the female class, it does not look too bad for one farm and one sire, particularly when you consider the fact that we had imported horses to show against in each class."

Canker Worm is on the decrease in Nova Scotia, where it has been working great injuries for a series of years. It will likely do serious damage only in a few sections this year.

The Brown Tail Moth in Nova Scotia is being fought most vigorously, and is kept well in control, but there is every indication that there is no prospect of eradicating the pest in the near future.

The Tent Caterpillar is reported from several districts. This is nothing unusual nor are there any indications that there is anything like an extraordinary infestation at any point. Nevertheless, indications are not wanting that in the neighborhood of Ottawa there will be many trees defoliated this year unless active measures are taken to repress the Tent Caterpillars. Their food plants are distributed so widely in fence rows and neglected bush lots, that the mild infestation of last year may possibly result in a serious invasion this year. Orchards that are well sprayed with the poisoned Bordeaux mixture will in all probability escape any serious injury.

FUNGOUS DISEASE.

It is too early to report with reference to these diseases, but there is nothing to indicate more than the usual prevalence.

SPRAYING.

Perhaps the most noticeable feature in the reports of correspondents for this month, is their universal testimony to the prevalence of spraying. Everywhere orchardists appear to be impressed with the necessity of spraying; and spray pumps, Bordeaux mixture and lime sulphur mixture are being used this year where they never were before. It would be less remarkable if these reports came from one or two sections, but from Prince Edward Island to British Columbia, there is a universal revival in connection with combating insects and fungous diseases.

FOREIGN FRUIT CROPS PROSPECTS.

Great Britain—Weather conditions have been favorable upon the whole and, though the promise for tree fruits is good at present, it is yet too early to predict a crop. Small fruits have wintered well and the rather moist weather last fall favored vines and trees.

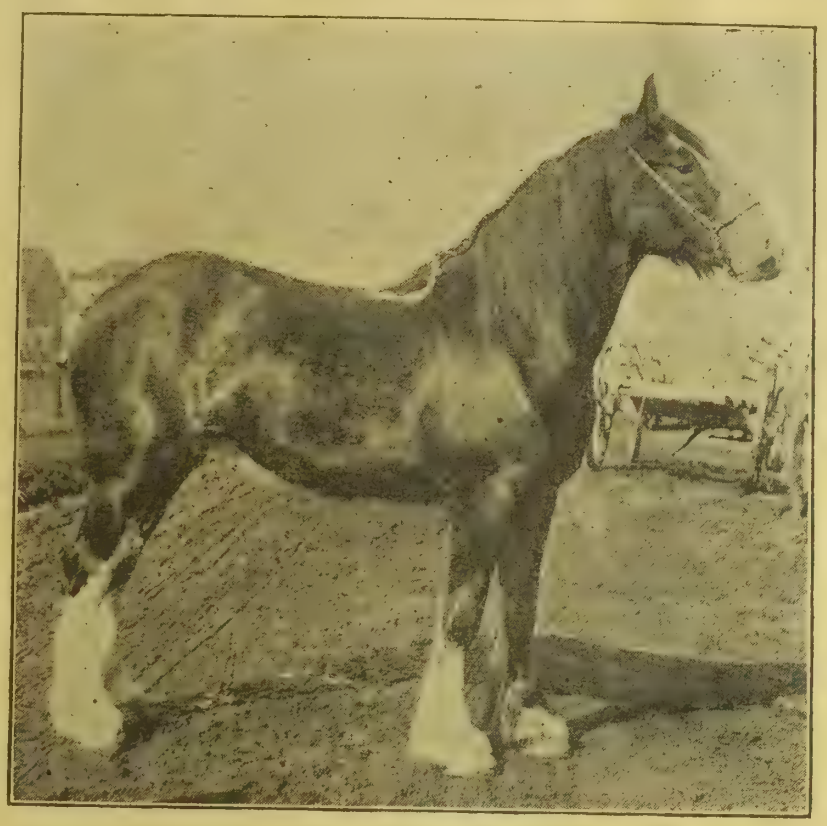
United States.—The conditions generally have been favorable for the apple crop. The Southwestern States show a fairly good bloom and not less than 80 per cent. of a full crop. The Pacific States have experienced a fairly good cool spring with no forcing of early bloom. Warmer weather is reported now and, with the exception of some slight injury to cherry and peach blossoms, no damage is reported from frost.

BETTER CARE OF ORCHARDS.

A marked feature of the apple industry particularly in Ontario this year, will be the number of orchards that are being worked on rental. A large amount of English capital has been invested through two or three companies in this enterprise. In addition to this, many local apple dealers have changed their methods and, instead of buying the fruit in the orchard as in former years, they have proceeded to rent the orchards. This has been done on so large a scale that it cannot fail to materially affect the quantity and quality of apples produced in Ontario orchards. Nearly all these rented orchards will be thoroughly sprayed and many of them have been pruned. In most cases there is a stipulation for cultivation of the ground as well. It is safe to say, therefore, that there will be several thousand trees this year receiving cultivation, pruning and spraying that did not receive treatment in former years. The immediate effect of this good treaement will be to increase the crop materially the first year. In estimating the crop for this season, therefore, liberal allowance will have to be made, over and above the usual estimates, for the increased quantity and quality of the apple crop as the result of this feature. This is mentioned here for the purpose of bringing to public notice this new element in the crop estimate, although there is yet insufficient data to make any definite estimate of the actual addition to the crop as the result of these new ventures.

CO-OPERATIVE ASSOCIATIONS.

Another important feature is the formation of a large number of new co-operative associations; in all probability the number will be double that of last year. Many of these, of course, are very small and may not do effective work the first year. The tendency, however, is towards a better quality of fruit, and a larger quantity of it from the same number of trees. It would be an easy matter, by only ordinary good care, to double the merchantable quantity of Ontario apples. This co-operative movement is not confined to Ontario. The development in Nova Scotia is even more noticeable, and it is not at all improbable that the larger portion of the crop will be handled co-operatively there, if not this year, in the very near future. A large increase in the number of associations is also noted from British Columbia.



Baron's Fancy.

By Baron's Pansy, a grandson of Baron's Pride. Her dam is by Up-to-Date Time, a noted son of Baron's Pride. Baron's Fancy was the winner of first prize for three-year-old pure bred heavy draught filly at the 1911 Maritime Horse Show and also of the first prize for two year-old filly at the Dominion Fair at St. John in 1910. Her dam was first prize heavy draught pure bred mare at the 1911 Horse Show and grand champion female at the 1910 Dominion Fair at St. John. Owned by Logan Bros., Amherst Point, N. S.

DIRECTIONS FOR SENDING SPECIMENS.

Orchardists are urged to examine their trees and plantations very closely for insects and fungous pests. Specimens of insects, if dead, should be wrapped in paper or cotton and inclosed in a pasteboard box. If the specimen is particularly soft it should be packed in cotton saturated in alcohol. Whenever possible grubs, caterpillars and so forth should be packed alive in a box together with a supply of their food; air-holes are not necessary. Particulars as to where the insect was found and the nature of the damage which it is doing, whether to leaves, buds or stem, are frequently of very great importance. Send for information and identification of specimens to:—

Dr. C. Gordon Hewitt, Dominion Entomologist, Central Experimental Farm, Ottawa.

TO CORRESPONDENTS.

The Fruit Crop Report will be published monthly, and will be sent free to any one desirous of obtaining a copy, on application to the Fruit Division Ottawa. Those who do not receive it regularly will confer a favor by notifying the Fruit Division.—A. McNeill, Chief Fruit Division.

FRUIT DISTRICTS.

To assist in estimating the marketable crop, the fruit districts of the Dominion are divided as follows:

District No. 1.—Counties north of Lake Erie.

District No. 2.—Counties on Lake Huron and Island to York county.

District No. 3.—Lake Ontario counties north to Sharbot Lake and Georgian Bay.

District No. 4.—Ottawa and St. Lawrence Valleys to Lake St. Peter and southwestern Quebec.

District No. 5.— New Brunswick with northeastern Quebec.

District No. 6.—Hants, Kings, Annapolis and Digby counties, Nova Scotia.

District Eo. 7.—Nova Scotia not included in District 6.

District No. 8.—Prince Edward Island.

District No. 9.—Lower mainland and islands, British Columbia.

District No. 10.—Inland Valleys, British Columbia.

Districts 1, 9 and 10 ship the commercial crop of peaches and other tender fruits.

Districts 1, 2, 3, 6, 9 and 10 grow plums, pears and winter varieties of apples for long distance markets and export.

District 4 ships Alexander, Wealthy Fameuse and McIntosh Red apples.

Districts 5 and 7 will not produce sufficient winter fruit for home consumption.

EXPLANATORY NOTES.

Those who would get full value from the Fruit Crop reports, would do well to study closely the nature of the crop in each of these districts.

District 1.—Grows a large quantity of apples of good size, fine color and excellent quality. Their one defect is that frequently even the winter varieties ripen so early in the fall that they deteriorate very materially befare the cold weather of the early winter sets in and, therefore, unless they are placed in cold storage as soon as they are matured they are apt to show a large amount of waste if any attempt is made to keep them during the winter months. The apples, therefore, in this district must, for the most part be regarded as fall and early winter varieties, unless cold storage facilities are provided to enable the holding of them for winter shipping stock. Consequently, if it should appear that there was a large crop in District No. 1, it would not materially affect the quantity of winter shipping apples, but would be counted in with the fall and early winter apples of the other districts. To this we might make the possible exception of such varieties as the Ben Davis, Stark and similar varieties that are very little grown in this district.

District 2.—Grows excellent winter apples. It is far enough north, or the elevation above the sea level is such, that the winter varieties like the Greening, Baldwin, Spy and Russet, ripen just as the early winter sets in; consequently, these varieties may be picked and stored with advantage, as winter shipping apples in ordinary storage.

A very marked peculiarity of the district is that orchards, though numerous, are small. The district is a very large one and apples can be grown to perfection in any part of it; but the farmers are engaged, for the most part, in mixed farming.

At three or four points selling associations have been formed, and wherever these have been organized apple growing is exceedingly profitable.

District 3. Grows an equally good quality of winter apples; but the orchards are larger and the fruitgrowers are taking better care of them. Pruning, spraying and cultivating are common. The varieties planted are fewer in number and confined almost exclusively to winter apples.

Another significant feature that must be taken into account in future apple reports is that planting is being done quite freely in District No. 3. The number of young trees under ten years old probably exceeds the present plantings. Consequently, each succeeding year there will be a large addition to the aggregate of the crop coming from District No. 3 as the result of new orchards coming into bearing. There will be a tendency, therefore, to underestimate the crop from this district on this account.

District 4.—This district has a large quantity of apples of the Fameuse and Wealthy type. The climate is too severe for the standard winter varieties grown in Ontario. The varieties, such as the McIntosh Red, Wealthy, Wolfe River and a number of other hardy varieties, are all fall and early winter apples. In estimating the apple crop, therefore, consideration must be given to this fact, that a large crop of apples in District No. 4 will materially affect the market only during the fall and early winter months, and even in such cases the apples grown in this district are more desirable for des-

CLEANING UP THE FARM.

The job of cleaning up is a perennial one on every farm that pretends to present a good appearance. The more constant the attention the better the effect and the cheaper the result secured. Brush, for example, can never be hauled away to fill a ditch or be piled up to burn as cheaply as when it is fresh cut. If left to die on the ground where grass and weeds grow up, protected from cattle and the mower, to bind it down, the formidable job of moving it will probably not be tackled for months, and perhaps not at all. The only way to avoid unsightly accumulations of trash is to gather up all such material the moment it has ceased to be useful and dispose of it.

A handy wagon and a quiet team fit in perfectly in the crusade. The wagon that is close to the ground is a great saver of man power and time in handling heavy and bulky stuff. Wide tires leave a shallow track even in soft ground and facilitate doing these odd chores about the fields when the ground is too wet for cultivation. The extra draft of a low wagon is not worth consideration for ordinary use about the farm. A big team has plenty of power in reserve that costs but a pittance compared with man power.

FARM THE PASTURES.

Nearly 50 per cent of the land devoted to pastures is waste land. It is not the fault of the land but the manner in which it is operated. Ltttle real practical consideration is given the truth that, "He who maketh two blades of grass grow where one formerly grew is a public benefactor." Why? Is it because farmers as a class care nothing for the honor of being public benefactors? Do they believe the task impossible? Every intelligent up-to-date farmer realizes that with the rapidly advancing price of land, every acre of pasture must in the future grow twice as much food for his farm animals as it formerly did. He knows it is not only possible, but essential. This is the year and right now is the time of the year to begin farming the pastures with the same thought and care used in raising cultivated crops. Sow to each acre a few pounds of grass seed suitable to your locality and the character of the land. Probably there are many bare spots in your pasture where grass should be growing and where grass would grow if the seed were sown. Furthermore if grass is not grown on these spots they will grow a crop of weeds. In fact this is the chief reason why weeds are such a pest in pastures—every rich spot that has nothing else to do will grow weeds and never, until the farmer is willing to farm his pastures systematically will weeds be eliminated from grazing lands. But whether or not new seed is sown thoroughly disk all pastures as soon after the frost leaves the ground as possible. Set the disks so the sod will be well cut to pieces and if time will permit give a second disking crosswise. To those who have never followed this plan, the pasture will be a discouraging sight when the disking has been completed but the greater production of grass during the coming season will prove the wisdom and demonstrate many advantages that have been gained. If seed has been sown disking will put it below the surface in the moist ground where it will germinate and grow. The sod bound roots will be torn apart and distributed more evenly over the pasture area and lumps of manure will be scattered where they will do good. Air, sunshine and light will be permitted to gain access into the soil and pasture grasses will respond quickly. They will not only grow much more vigorously but because of the separation of the roots the stand of grass will be more evenly distributed over the acreage. There will be fewer bare spots for weeds to grow. Keep the stock off the pastures till the grass has become started and the moisture from the spring rains has scoaked in. Permit the ground to become dry enough so the animals will not tramp out the grass. Prior to this the grass has little feeding value and much harm is done the pastures. The little feed the stock gets is far outbalanced by the injury to the sod. Practicing these three simple rules should double the production of grass and lessen by half the number of weeds but further improvement can still be made by keeping the weeds mowed close to the ground during the summer and by giving the pasture a good coating of manure at those times of the year when it is impractical to spread it on other portions of the farm.

WEEDS ON THE FARM.

If one were ask to define the term weeds, he would probably have difficulty in answering the question. Nevertheless there is not a practical farmer who has not a definite idea of what weeds are, although it is not easy to express that idea in polite English. The entire season's work upon most farms is divided into two groups, that which stimulates the production of the soil and that which destroys the weeds that dwarf the life of the crops and consume the fertility. Weeds spring up everywhere. They are universal. They appear in the corn field, in the pastures, in the meadow, along the roadside, in the grain fields, in the flower beds and the door yards. In cultivated crops it is possible to keep them down by vigilant and systematic work. In the pastures they can be checked only by stimulating a more healthy growth of grasses, that will choke them out. In the meadows the same is true. Along the roadside weeds can be killed by mowing. Around the homestead they must be fought by hand cultivation. They are persistent year in and year out. The seed often lives in the soil for several seasons, springing up and giving a luxuriant growth when one fondly hopes that the pest has been killed out entirely. Weeds rob the soil, cut down the yield of grains; they make the miller and the grain buyer reject or dock the cereals that are offered at the elevator. They increase the cost of cutting and threshing; they make cultivation difficult. They grow in the pastures, spoiling the milk with their rank flavors. They disfigure the roadsides and the homesteads. They are the enemy against which the farmer is constantly waging warfare. If he is successful, he is considered prosperous and up-to-date.

If he is beaten in the struggle, his farm may go for mortgages because the crops will not pay the cost. Weeds have stimulated the thoughtful men to find new methods of fighting them. Improvements are frequently made in machinery for cultivation of the soil with the sole idea of making it more easy to control these pests. The latest invention, one that has been successfully tried out, by a number of experiment stations is the spraying machine. Certain chemicals can be applied to growing crops, especially to the small grains, that will not injure the plant but will kill the weeds. Wild mustard was the object of the first experiments with these sulphate of iron sprays. It was demonstrated that the machine could be driven through the field of small grain, spraying all of the plant life with this mixture and the result was a complete cleaning out of the mustard and wild radish, without injuring the grain in the least. Another weed that comes in the same class is dodder, the enemy of Alfalfa. This can be treated in the same way. As a rule this plant grows from seed that finds its way into the field with alfalfa and clover. The plant grows rapidly and twine around the alfalfa and clover until the latter is completely exhausted. If the pest has a very serious hold upon the crop, the alfalfa or the clover will sometimes be killed back to the ground, by a spray that is strong enough to kill the weed, but the roots soon recover and the crop will grow with increased vigor. The weed spray is an innovation that will be gladly received, for anything that will help fight the greatest pest upon the American farm is welcomed by the progressive farmer.

ARRANGE TO TRY ALFALFA THIS YEAR.

No better advice can be given the farmers of the cornbelt than to complete arrangements now to get a strong set of Alfalfa on a small field this year There is no crop so profitable in the whole range of legumes possible of growth in this whole wide country. It is not necessary to go to any very great expense in order to get the hang of starting Alfalfa on its way to successful growth. Experiments have been conducted in such luxuriant numbers that every pitfall in the way of success has been platted, mapped out and marked with the red flag of danger. Every factor leading to the reaping of substantial yields has been tried, demonstrated and listed. It is no hard trick to get a stand of alfalfa. Literature thereto pertaining, written in the plainest and most pleasing way, is plentiful and cheap. Bulletins galore may be had for the mere asking. Experiment station workers will lend their aid free of cost, or at the most for a mere nominal charge, to enable any willing farmer to get a start in alfalfa growing. Furthermore, this princely forage plant may be grown in the cornbelt either from spring or fall seeding. The writer has succeeded with both. Alfalfa is good for every domesticated animal common on the American farm, for the chickens, ducks and geese as well. Even palatable and nutritious compounds for human consumption may be concocted from its disintegrated leaves in conjunction with farinaceous products. Alfalfa is a boon and a blessing to men from "Zemblia's shores unto far Peru," and then somewhat further. Alfalfa should form a staple crop on every Maritime farm.

Dairy or Beef Cows.

A ton of coal fed to the furnace of a steam boat would not make her climb a hill would it? No, steam boats are not made for hill climbing. Well, then, if you want to get the most milk and butter out of a ton of hay and corn would you feed it to a beef bred cow? Hardly, if you want any profit on your labor.—Missouri Farmer and Breeder.

How Can Alfalfa Growing Receive a Boost in the Maritime Provinces?

What Some Ontario Farmers Think of Alfalfa.

One of the editors of Farm and Dairy, an Ontario farm paper, well known to some of our readers, took occasion to interview a number of farmers near his home, at Brant, Ontario, who had been growing alfalfa. The alfalfa crop should need no other praises than these men give to induce farmers everywhere to grow it.

He found, as we have often found, that to talk with any man who has found out how to grow alfalfa successfully; talk to him about this crop and immediately you are engaged in conversation with an enthusiast. The wonder grows why farmers everywhere have not been growing this crop more generally and that seed merchants have been able to supply the demand for alfalfa seed at anything short of a fabulous price.

A. G. Kitchen: "I am in love with alfalfa. It gives more feed per acre than anything else I grow, unless it is corn, I used the hay from an acre of alfalfa to feed with corn ensilage is worth as much as the feed one might secure from an additional acre of corn. I have bought five bushels of alfalfa seed already this spring, and am going to buy seven more. This will sow 36 acres, since I will have it seeded at the rate of 20 pounds to the acre."

BIG RETURNS FROM ALFALFA.

On his home farm Mr. Kitchen has had 10 acres of alfalfa, which he has mowed for seven years. He claims it has yielded over six tons per acre, and sometimes seven tons annually. At one time he was rather doubtful as to the value of alfalfa hay compared with red clover. Now he has changed his mind, and last week placed himself on record as believing one ton of alfalfa hay to be as good as 1½ tons of red clover, and then alfalfa gives a much greater yield than is possible with red clover. "Alfalfa along with corn ensilage is to be the salvation of farming in this country," said Mr. Kitchen. Before long all of our farmers will be growing alfalfa and growing it in a rotation with other crops—a longer rotation than they now practice with red clover."

O. Collins: "I have grown alfalfa for the past 10 years. I generally take the first cutting for hay and afterwards pasture it throughout the season. This year I have only five acres in a pure stand."

OUGHT TO FEED GRAIN WITH IT

Percy Clemons, son of George W. Clemons: "We have 12 acres of alfalfa, and have been growing it for 15 or 16 years. It is a great feed. We are satisfied with it, although one ought to feed pretty liberal grain rations, even with alfalfa, to get the best results from dairy cows. With cows that are not giving much milk, however, one is able to displace a lot of grain with alfalfa. We could not get along without alfalfa and ensilage, and also mangels. Alfalfa and mangels practically take the place of good grasss. Our alfalfa hay averages four or five tons to the acre, sometimes better. Last year we secured 5½ tons an acre on the average. We sow the crop on our high land. If one has clay hills or clay knolls, that is the place for him to grow his alfalfa."

ALWAYS PASTURE ALFALFA.

Hiram Roseborough: "I have eight or ten acres of alfalfa. I have never tried it yet for hay, having always pastured it. Alfalfa is great for pasture. I have my alfalfa on a rough field, one that I do not wish to work. It has been seeded for 15 years and has been broken up and reseeded but once in that time. The soil is of a clay nature, with some stones in it. Pasturing does not seem to injure the alfalfa, although I do not like to pasture it too closely, especially in the fall, and I have never pastured it with sheep. Last year I seeded four acres additional to alfalfa, part of which this year I shall cut for hay and the rest will be used for pasture for hogs."

ALFALFA AWAY AHEAD OF RED CLOVER.

Cecil Schuyler, son of J. W. Schuyler: "We have 12 acres of alfalfa, part of which was seeded a year abo. On loamy soil, such as ours, alfalfa does not stand pasturing well, particularly late in the fall. The crowns seem to stand high on loamy soil and the cattle bite them off. On clay soil there is not the same danger since the crowns set much lower to the ground. For feed alfalfa is away ahead of red clover. Horses not working will fatten real fat upon it. There is nothing like it for colts and calves. Had we quit growing alfalfa after our first experience with the crop we should have claimed it to be no good. At that time we did not know how to handle it. We now inoculate the seed and sow it with a nurse crop of three pecks barley to the acre and are able to secure first class stands."

ALL THAT ANYBODY CLAIMS FOR IT.

S. J. McLean: "We have six acres of alfalfa to cut this season, and are seeding eight acres more. There is nothing any better—nothing can surpass alfalfa in the way of fodder. It is all that anybody claims for it. I intend to put in alfalfa at any cost until our farm gets well stocked with it."

T. S. Atmore: "I have but two acres of alfalfa. From this I get 10 or 12 loads a year. I simply grow enough to take the place of what bran I otherwise would require, and I find it very satisfactory."

John Beemer: "I have about four acres of alfalfa. There is nothing like it. I am preparing more land to seed to this crop, and ere long I expect to grow it in a regular rotation with other crops."

CAUSES BIG DIFFERENCE IN MILK FLOW.

Guy Durham: "We have eight acres of alfalfa and have had it for some four or five years. We like it fine and would not like to be without it. It is a long way ahead of red clover, and we see a big difference in the milk flow of our cows when fed alfalfa as against red clover. Another year I expect to sow eight or ten acres more to this crop."

Herb. German: "I like alfalfa fine and have grown it for about 10 years. Just now we have 10 or 12 acres, having plowed up six acres last fall; I will seed five acres more this spring. I intend to try it on fall wheat this year since I have seen some real good catches secured in that way. I feed our alfalfa hay to everything about the place, and I think it away ahead of any other feed."

Jas. Atkin: "We have over 20 acres seeded to alfalfa, and have planned to seed seven acres more this spring. We do not know how we could do without alfalfa. It is better than any other hay. Seven years ago we had our first field of alfalfa. We aim to have at least 30 acres of it annually. We find that we get our strongest plants when we inoculate the alfalfa seed with the nitro-culture that we get from Guelph."

Arthur W. Smith: "Alfalfa is all the hay we have and I find our animals at least do not die on it. I feed it to everything and have been doing so for the last six or seven years, since it is the only hay we grow. Some people say that alfalfa hay injures the horse's kidneys. Perhaps it may; but I know that I can scarcely hold my horses. You ought to see them. They do not look much like dying anyway, and they do not get a mouthful of oats, and all of my horses are just wild."

"I consider alfalfa a very wholesome feed. I have nine acres in alfalfa, and have grown the crop and cut it for hay for the last eight or nine years. I sowed it for pasture on hillsides 14 years ago. From the nine acres now seeded to alfalfa I have never got less than 27 big loads from the first cutting; from 12 to 16 loads from the second cutting. I should say that sometimes we pasture the second cutting and never cut the third crop, but pasture it always. Last year the third cutting would have made at least one ton to the acre. This field has been handled in the manner indicated now for five years. Alfalfa seems to do fine on any soil. The first cutting often grows most too big in the low land. Last year some of mine would measure five or six feet in length."

PASTURES HIS ALFALFA CLOSELY.

Alfred Smith: "I have 11 or 12 acres seeded to alfalfa, part of which I cut for hay, the rest being pastured. I pasture more of the alfalfa than I cut. I hardly ever grow timothy at all any more, and have been growing alfalfa for seven years. It stands pasturing fine. I have pastured mine into the ground late in the fall, real close, with horses and all of my stock and the pasturing has never killed it; I made the experiment on purpose to see. From 3¼ acres of alfalfa I cut for hay last year I got 21½ loads; from the first cutting 12 loads; second, six loads; third, 3½ loads. After taking the third cutting the stand grew about one foot in height, and this I pastured. I like alfalfa hay the best of any fodder I ever fed."

H. R. Nixon: "Alfalfa is O. K. You cannot say too much for it. I haven't fed my cows a bit of grain since I had alfalfa hay, and I reckon that they milk as well as when I used to feed lots of grain. The hay from the second and third cutting is just like pasture."

OLD TIME METHODS UNSUCCESSFUL.

At one time, and that not many years ago, Mr. Nixon was opposed to growing alfalfa. He grew it over thirty years ago, and from his experience with the crop at that time he was not in favor of it. Asked for an explanation of this fact he said: "One cannot make much of a success with alfalfa by following old time methods. I did not, in years gone by, cut the crop in time. The first cutting was left until the usual haying time, and the leaves all fell off, so that when the hay was housed it was for the most part merely bare sticks. Now, however, by cutting it at the right time we find it makes a splendid crop of hay and the second and third cutting especially are much superior to red clover."

Mr. Nixon states that his alfalfa runs about three loads to the acre at the first cutting and all told he gets from five to six good big loads to the acre in the season. On one of his farms he has 10 acres seeded now, and expects to sow 11 more this spring. On the adjoining farm he has five acres of an old alfalfa stand and eight acres more, which he plowed up last fall, will be reseeded this spring.

What a boom Alfalfa will be to Maritime Canada when we master the growth of it. All it needs is intelligent, industrious effort.

Value of Alfalfa as a Fertilizer

When in his system of rotation the farmer is ready to plow up his alfalfa, he has another inestimable contribution to the land's fertility in the stubble and roots. It is not recommended to plow under any considerable growth as a green manure, as the hay crop is too valuable. Its market value would buy more fertilizers than the same growth is worth for humus. After a field has stood for five or six years, the roots have added largely to the humus content. Prof. W. P. Headden, of Colorado, estimated that the fertilizing value of the stubble and 6½ inches of roots plowed under is worth about $20 per acre, while the value of the stubble and entire root system is not less than $35 per acre.

Read What James J. Hill says.

"I would like to see more alfalfa raised here. The soil is ideal for it, and with northern grown seed, such as is produced in Montana, the farmers will find it the best paying crop they can raise. Good alfalfa is worth $40 per acre, and if I had to choose between corn and alfalfa, I would raise alfalfa every time. Of course, it is better to have both.

"Land which could be purchased at from $8 to $10, and some of it at $5 an acre, twelve years ago, is now selling readily at from $85 to $100 an acre as a result of getting it into corn and alfalfa, but particularly alfalfa."

Nitro Culture.

Now that the spring season is approaching, farmers are, no doubt, beginning to think of seeding operations. Everything points to more clover, including alfalfa, being sown than ever before. No doubt the unusually high quotations for timothy seed will lead to the use of a larger proportion of clover than heretofore. With many it is a difficult problem to get clover of any kind, and more especially alfalfa clover, to catch. One of the chief sources of trouble is that the soil has not been inoculated with the bacteria necessary to the successful growth of these plants.

As in previous years, the Nova Scotia Agricultural College will supply bottles of bacteria, suitable for the inoculation of alfalfa, red clover, alsike, peas and vetches. The commercial charge for these bottles of bacteria is usually $2.00, but the Nova Scotia Agricultural College, like the other agricultural colleges in Canada, are supplying these nitro cultures at the nominal cost of 25c. per bottle. Last year nearly 600 cul-

tures were sent out from the College and, while in many cases very indifferent results were obtained, yet in a large proportion of the cases results are reported very satisfactory.

Those who are interested are advised to address the Principal, Nova Scotia Agricultural College, Truro, Nova Scotia.

With Whom Alfalfa is Popular.

The popularity of the alfalfa crop has increased in Ontario this spring as never before. Aggressive farmers in almost any locality one may name have during the past few years grown the crop experimentally. Now they have assured themselves that alfalfa is all that even enthusiasts claim for it. Hundreds of these farmers will greatly increase their acerage of alfalfa this year. Neighbors to these progressive men who have grown alfalfa and to whom "seeing is believing" recognize in alfalfa a money making fodder, and they are going to see a fair acerage to the crop.

Go where they will the editors of Farm and Dairy have yet to meet a man who has once grown alfalfa in the light of present day information and according to approved cultural methods but has made a success of alfalfa growing. We have interviewed men who have claimed alfalfa to be as good as bran; some say it is better. Most everyone claims it to be much superior to red clover for feeding purposes. The best argument of all in favor of alfalfa is that leading farmers everywhere are growing it.

Many interesting experiences with this crop have been related to our editors in recent weeks. A goodly number of satisfied and enthusiastic growers state that had they not persevered with alfalfa they would today condemn the crop. They encountered some difficulty in getting satisfactory stands until their soils become inoculated with the bacteria necessary for alfalfa, but now they claim it to be as easy—some say it is easier—to secure a good catch of alfalfa as of red clover.

The belief is being expressed that ere many years we all will grow alfalfa as we now grow red clover, and that soon alfalfa will be grown regularly in rotation with other crops, and as it is given the place red clover now occupies the rotation now practised will be lengthened by one, two years as is needed to meet the requirements of varying conditions.

Quite a number of farmers inform us that they are planning to sow alfalfa another year; that in the meantime they will prepare their land for alfalfa. These men on enquiry tell us they make no special preparation for seeding red clover; they simply go ahead and sow it. While it is not advisable to sow expensive alfalfa seed on land ill-prepared we cannot get away from the fact that in thus putting off the growing of alfalfa we are but putting off for a year the increased returns that alfalfa will give. Prepare land for next year's seeding if you will, but sow some alfalfa this spring. If the land be not in suitable shape, prepare it early in the season and sow it later without a nurse crop. Success with the crop will then be more sure than if sown with a nurse crop and a yield may be secured this season—Farm and Dairy.

Alfalfa in Ontario.

So great is the interest taken in alfalfa in Halton Co., Ont., in the more progressive districts that it is said that the women folk there are in the habit of discussing the wonderful merits of the crop at their afternoon teas. It is certain that the farmers themselves must have been discussing alfalfa for some time past, as in some of the townships several acres of alfalfa are found on almost every farm, and where proper methods have been pursued the farmers without exception enthusiastically proclaim the wonderful feed producing qualities of the crop.

Mr. J. Lynn, of Nassagaweya township, informed one of the editors of Farm and Dairy recently that three years ago his father put in 20 acres of alfalfa. Ten acres was on low, wet ground and was not a big success. The other 10 acres on higher land did well. The following year after taking the first cutting the field afforded splendid pasture for the rest of the season. Equally good results were obtained the second year and in neither case did the alfalfa seem to be injured by pasturing. Most of the alfalfa was fed to the horses, and Mr. Lynn states that alfalfa is a particularly satisfactory horse feed.

ALFALFA WITHOUT A NURSE CROP.

"I never missed a catch of alfalfa in my life," said Mr. O. W. Morse, of the same township. "I start early in the spring and work over the soil every week or 10 days until the end of June in order to give all weed seeds a chance to germinate and then cultivation exterminates the young weeds. If my land were clean I would sow the seed alone without a nurse crop as soon as the soil is in fit condition in the spring, and in this way I get a good cutting the first year, and have sufficient growth of the second crop to protect the alfalfa through the winter."

Particular stress was laid by Mr. Morse on the value of alfalfa as a weed exterminator. "It is the only thing," said he, "I know of that will exterminate blue weed, with which my farm is infested. The thorough preparation of the soil for the crop will kill a great many of the seeds, and as we cut the alfalfa two or three times the seed never gets an opportunity to ripen. Blue weed is a biennial and it will disappear in a couple of years." Mr. Morse has grown alfalfa for 10 years and is becoming more enthusiastic each year over the crop, and by next spring plans to have the greater portion of his small farm seeded to alfalfa. The soil on this farm is of a light gravel that will not produce other crops satisfactorily.

Quality

in tea may mean to you flavor or strength or fragrant richness. Red Rose Tea is blended with such nicety that it is the combination of all three points of merit. Will you try a package. 91

RED ROSE TEA "is good tea"

WILL NOT PASTURE ALFALFA.

One point in which Mr. Morse most decidedly differs from his neighbor, Mr. Lynn, is in the matter of pasturing the alfalfa. Speaking with Farm and Dairy's representative on this point he said, "If you examine an alfalfa field you will notice that the crowns of the plants come up higher above the surface than do those of red clover, or the grasses. Close pasturing, particularly by horses, injures these crowns causing the death of the plant. If pastured at all alfalfa must be pastured very cautiously, and it is my opinion that no pasturing is better yet.

Mr. Chas. Twiss will put in seven acres of alfalfa this spring. He has had a small acerage seeded to the crop and is well satisfied with results. His neighbor, Mr. Albert Hull, is also putting in seven acres. Part of the soil on Mr. Twiss's farm is a light sand, full of twitch grass, and experience has taught him that alfalfa will kill this weed. Mr. Twiss informed our representative that he had gotten his first enthusiasm for alfalfa from his uncle, Mr. Robt. Twiss, of Wentworth county, who regards alfalfa as an A1 feed for both milch cows and hogs. This gentleman feeds his cows on corn silage without meal with splendid results. For pig feed Mr. Twiss steams the alfalfa in a large vat and mixes with it meal and whey. He keeps 100 hogs. Very little meal is put into this alfalfa ration until the hogs are to be finished for market, when the proportion of meal is increased. —Farm and Dairy.

Alfalfa as a Chicken Feed.

Hundreds of carloads of both live and dead poultry, as well as thousands of cases of eggs, are sent annually from the western states to the great markets in the east. Many people are at a loss to account for this commodity being shipped at a profit such long distances. The secret of it is cheap production in the western states by means of alfalfa. The poultrymen in the east are waking up to the importance of alfalfa as a poultry feed, and all the large progressive poultry plants depend upon alfalfa, either in the form of meal or shredded alfalfa for the production of eggs.

In Elmira, a city of 40,000 population, there were four or five carloads of alfalfa meal brought in last year simply for the use of the poultry men. On a large and noted poultry establishment there, the proprietor says that he could not keep his fowls healthy and have them produce fertile eggs in the confined quarters in which they are kept unless alfalfa was the chief ingredient of their feed. Last year he bought over 150 tons of alfalfa hay to grind into meal, and then mix with his patent chicken feed, one of the chief virtues of which is that it has a considerable proportion of alfalfa meal in it.

CHICKENS DEVOUR ALFALFA.

In the course of my work last season I called on a farmer at Lewis, N. Y., who had several acres of good alfalfa about two feet high, save on a space of about two or three rods wide, near his buildings, that was cut down almost as if a mower had gone over it. A large flock of hens kept on this farm had worked this devastation. I asked the farmer if it were not rather hard on the alfalfa to have the hens running on it. He admitted that it was, but said that it was good for the egg basket, and that was what he was keeping the hens for, and because of that he was growing the alfalfa.

Poultry men are finding that by feeding alfalfa meal or shredded alfalfa either wet and made into a mash, or shredded and scattered on the floor, that their fowl will lay much better than they formerly did in the winter when eggs are high.

Experiments and practical experience have shown that when hens are fed on an unlimited qulanity of alfalfa during the winter and the early spring, that a greater number of the eggs than usual are fertile, and the per cent. of eggs which hatch are more than double that under the ordinary method of feeding.

One of the best ways of feeding alfalfa to poultry is to have it cut either in quarter inch lengths or have it shredded, then use it as a litter on the floor of the hen house, when the hens will be happy and busy all day long and reward their owner by laying regularly. A more economical way is to feed it from a rack of wire poultry netting tacked on to the side of the wall.

SOW SOME FOR YOUR POULTRY.

Readers interested in poultry, will find it to their advantage to sow a sufficient amount of alfalfa as a pasture for their hens in summer, and also enough to provide alfalfa ay for them through the winter. Care should be taken to keep the ens off the alfalfa field until the oots have become well established, ince some of the mysterious failures f the alfalfa crop, after it has made a good start, has been due to the fact that the hens found it out, and knew a good thing when they saw it. The result being that the hens would take the whole plant, with root and top, at a mouthful; the ordinary farm flock of 50 or 100 hens will soon clean up a one acre field of ewly seeded alfalfa.—Geo. Marsh, in Farm and Dairy.

Alfalfa is the king among hay crops, the queen among soil improvers, the prince among drought-resistant plants. It comes nearer to giving something for nothing than anything else on the farm. It will produce more hay per acre, and hay of a higher feeding value than timothy, groom grass or western rye grass. While giving that valuable crop of hay it will at the same time leave the soil richer in nitrogen and humus every year that it occupies the land, and supplies the very things that the grain crops take out the fastest and leave the soil in the greatest need of.

Still the whole story is not told. As weeds cannot grow readily after alfalfa gets a good stand and if they should grow a little the alfalfa is cut before the weeds are ripe so they cannot go to seed. The roots go deep and so open up the soil better than the subsoiler.

While alfalfa will adapt itself to almost all varieties of soil it is better to give it every chance the first time it is sown on a farm. Take 10 acres of a good dry field that you intend sowing to oats or barley, work it up well, but do not worry if there is some grass or weeds left. A little grass will not hurt the alfalfa and will make good hay when mixed with the alfalfa, and weeds will have no chance in a good crop of alfalfa.—W. C. Palmer, North Dakota Extension Bureau.

Advantages of Being a Member of a Cow-Testing Association.

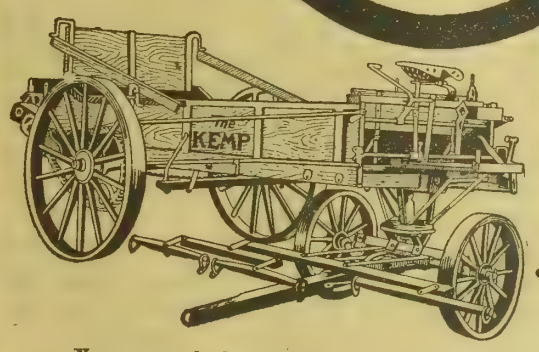
Organizations for testing the individual merits of the dairy cow seem to have come about as naturally as the organization of a police force. The country must have a supreme government to regulate the relations between man and his fellow-men, and authority to make, execute and enforce laws. It seems to me that the farmer must be a supreme power unto himself, and thus carry out the three great objects of any government, whether of the nation or the farm, namely: Protection from enemies without; establishment of justice within; promotion of the general welfare.

The cow-test association forms the right arm of the farmer's government because it carries with it elements of each of these objects. The enemy who steals your profits, your progress in breeding, your standard of excellence and your belief in the farm as the best home, cannot enter your barn if the index finger of a tester can be placed on her records in the past. Justice can be given every member of your herd by this means.

So many times the case is like that of a New Hampshire farmer who kept a herd of 12 cows and made the small profit of $195.86 one year. Someone persuaded him to join an association, and he found that the first six cows in his herd paid just 30 cents more than his best cow! What aninjustice he was doing that one cow by keeping those six useless creatures. What a protection was afforded him by this detection of the thief.

The third object offers such wonderful opportunities that my paper cannot mention half. Co-operation is the greatest stronghold of any business proposition. We have already found that to be true, for by this co-operation we are purchasing our grain, seed and fertilizer at greatly reduced prices. Associations a little farther advanced are not only purchasing cheaper, but are selling their produce at far higher prices. This is the step we should be taking to

(Continued on page 609.)



At least one-third lighter draft

Genuine Kemp Manure Spreader

You can only buy one manure spreader with the Reversible, Self-Sharpening, Graded Flat-Tooth Cylinder—and that is the Genuine Kemp.

Because of this Graded Flat-Tooth Cylinder the Genuine Kemp is at least one-third lighter draft than any other spreader.

There is less friction on the Flat-Tooth Cylinder, because the teeth are wide and graded. On that account only one-third as many teeth are required, which reduces the friction when the manure is passing through the cylinder.

The square or round teeth on ordinary cylinders are not wide enough apart and the manure backs up, chokes cylinder, causing heavy draft.

The manure cannot back up against the flat teeth, and because the flat teeth are graded they will handle and thoroughly pulverize all kinds of manure from the clear gum to the strawy material.

There are many other exclusive improvements on the Genuine Kemp. Our big catalog describes and illustrates them fully. Send for a copy and learn some new facts about manure spreaders.

There would be twenty times as many manure spreaders in use in Canada today if farmers realized the economy of spreading manure with the Genuine Kemp. The Genuine Kemp will pay for itself faster than any other farm machine.

But send to us for catalog step. We are sole selling agents That's your first in Eastern Canada 62

FROST & WOOD CO., LTD. SMITH'S FALLS, CANADA

Well Balanced Rations.

In a very carefully written article appearing in one of the late bulletins from the Central Experimental Farm, Prof. J. H. Grisdale gives several rations which he has tried out with splendid success in the matter of ensilage feeding.

He states that corn silage and straw or chaff, while together making up a most excellent foundation or base, do not alone constitute a well-balanced or suitable ration for any class of live stock. For feeding heifers or young stock some bran and clover hay should be added. A suitable ration would be as follows:

For yearling heifers:—Corn silage, 25 to 35 lbs.; straw or chaff, 4 to 6 lbs.; clover hay, 4 lbs.; bran, 2 lbs.

For dry cow:—Corn silage, 50 to 60 lbs.; straw, 8 to 10 lbs.; clover hay, 4 lbs.; bran, 1 to 2 lbs.

For cow in milk:—Corn silage, 45 lbs.; straw, 6 lbs.; clover hay, 4 to 6 lbs.

Meal mixture:—Bran, oats, gluten or oil cake meal or cotton-seed meal, equal parts. One pound meal to three or four pounds milk produced per day.

For steers running over winter, (1,000 pounds weight):—Corn silage, 60 to 75 lbs.; straw, 8 to 12 lbs.; clover hay, 2 to 4 lbs.

For fattening steers (1,000 pounds) —Corn silage, 50 to 60 lbs.; straw, 6 to 10 lbs.; hay, 3 to 6 lbs. Meal—Starting at one pound go up to 10 lbs. perdiem.

A good meal mixture would be corn, bran, barley and oil cake meal, gluten meal or cotton-seed meal. Take bran and corn, bran and barley, equal parts, or bran, corn and barley, equal parts, to which add an amount of any one of the last three equal to one-quarter of the total weight of the meal mixture when ready to feed.

Church and Farm.

Rev. Charles O. Bemies, of McCellandtown, Pa., has been secured to conduct the Rural Social Life Course of the short course in agriculture for pastors at the College of Agriculture of the University of Maine next July 10 to 21. Mr. Bemies has had a large practical experience in dealing with the problems which he will discuss, and the University is very fortunate to be able to secure his assistance. He is one of the leaders in the new movement for the upbuilding of the rural church and a closer relation between pastor and people through an agricultural education of the pastors, which will enable them to be of the greatest possible help to their people.

This is the first time that the University has offered a short course in agriculture for pastors, and other social and religious workers. The course will open Monday evening, July 10, and continue for two weeks, closing Friday, July 21. It will include lectures, demonstrations and laboratory work in various phases of agriculture.

Running throughout the entire course, one hour during each forenoon will be devoted to a discussion of Rural Social Problems and the Relation of the Church to Country and Farm Life. At least three evenings each week will be given over to Conference and Round Table discussions. The subjects and problems considered at the evening meetings will include the Back to the Farm Movement, Rural Surveys, Boys' Work, with especial reference to Boys' Agricultural Clubs, Decoration of Church, School and Home Grounds. Friday evening, July 14, a reception will be given.

The formal announcement will be

$3,600

in Cash Prizes for Farmers

Your Photograph May Win a Prize

CANADA CEMENT COMPANY LIMITED PORTLAND CANADA CEMENT MONTREAL

AMONG the prizes we are offering in our big Prize Contest is one of $100.00 (Prize "C") for the farmer in each Province who furnishes us with a photograph showing the best of any particular kind of work done on his farm during 1911 with "CANADA" Cement. For this prize, work of every description is included.

Now just as soon as you finish that new silo, barn, feeding floor or dairy, that you've been thinking of building, why not photograph it and send the picture to us? The photograph doesn't necessarily have to be taken by a professional or an expert. In fact, your son's or your daughter's camera will do nicely. Or, failing this, you might use the kodak of your neighbor's son nearby. In any event, don't let the idea of having a photograph made deter you from entering the competition. Particularly as we have requested your local dealer to help in cases where it is not convenient for the farmer to procure a camera in the neighborhood. By this means you are placed on an equal footing with every other contestant. Get the circular, which gives you full particulars of the conditions and of the other three prizes. Every dealer who sells "CANADA" Cement will have on hand a supply of these circulars—and he'll give you one if you just ask for it. Or if you prefer, you can use the attached coupon—or a postcard will do—send it to us and you'll receive the complete details of the contest by return mail.

If you haven't received your copy of "What the Farmer Can Do With Concrete," write for that, too. It's a finely illustrated book of 160 pages full of useful and practical information of the uses of concrete.

Write us to-night, and you'll receive the book and the circular promptly.

Do not delay—sit right down—take your pen or pencil, and fill out the coupon NOW.

Canada Cement Company, Limited,
National Bank Building, Montreal

Please send Contest Circular and book.

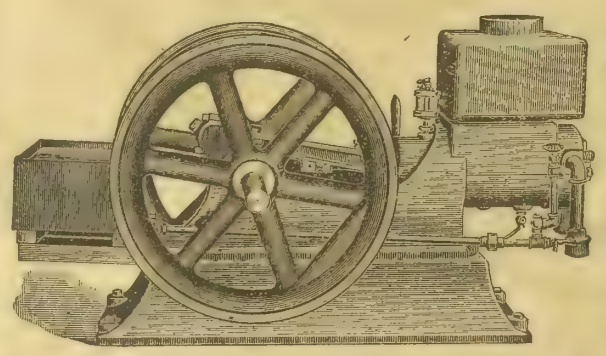
SECOND HAND ENGINES OFFERED.



We have eight second hand Stationary Gasoline Engines of different makes, now used in the Maritime Provinces, which we have taken in exchange for our Waterloo Boys.

These Engines have been thoroughly overhauled, worn parts replaced with new pieces and engines put in good running order.

The size runs from 3 to 8 H. P. Write us what size you want and we will quote you extremely low prices.

Every Engine guaranteed to run satisfactorily.

We have a first class Repair Shop and will repair any make of engine.

If you are thinking of exchanging or overhauling your engine write us.

J. D. FRIER, . Sussex, N. B.

ready for distribution within a few days and will be forwarded on request. Letters of inquiry should be addressed to the College of Agriculture, Orono, Maine.

We have often advocated a course similar to the above for our Maritime Province pastors.

Benefits of Drainage.

The plant growing on undrained soil may be well compared to an animal kept in unsanitary conditions, with little access to light and air, while the plant growing on drained soil may be compared to the animal kept in sanitary quarters. A farmer would never think of placing his best horse in a cold, dark, poorly ventilated stable, feeding in a haphazard way and expect anything but poor returns. He frequently sows his crops on soil saturated with water, from which air and heat are excluded during the greater part of the growing season and expect a full crop. Proper conditions are conducive to good returns in stock growing, they are also conducive to good returns in growing a crop.

Seed germination and plant growth do not begin in the spring until the soil is sufficiently warmed by the sun to insure a normal growing temperature. As long as soils look wet, or there is surplus water near the surface evaporation is going on, and the amount of heat used runs from 25 per cent. to 50 per cent. of the total amount received from the sun. This, at a time when warmth is needed to germinate the seed and bring early spring into cultivation, when hours and early tillage mean dollars, is a serious loss. With drains below, by which the water is carried off, air which is easily warmed by the sun fills the pores of the soil and aids germination and growth—for air is just as essential about the roots of a plant as air in the lungs is to the life of man. In undrained soil air is almost excluded, and the small amount that is present soon becomes impure by the plants giving off poisonous substances, just as the air in a stable will become impure if ventilation is not provided.

Drained soils absorb water from summer showers much faster than undrained, and this saves a needless loss caused by the water running over the surface, carrying with it the richest soil or lying in the lowest part of the field hindering and killing the plants, until evaporation brings relief.

A common idea of underdrainage is that the water table is lowered to such an extent that in times of drought the roots cannot reach the moisture, and hence must suffer, while the opposite is the result. When a crop is starting to grow, the natural method is to send its roots deep into the soil, to gain a solid hold, and have a large amount of room to obtain a supply of food. If sown on undrained land, where the water table stands within a few inches of the surface, the roots do not enter the water, but attempt to stretch sideways, with the result they are crowded and shallow, and the plants, necessarily small, sickly and stunted. If sown on drained land, where the water table does not come within three or four feet of the surface, the roots strike deep and strong, are able to cover a larger area in obtaining food, and produce strong, vigorous plants.

In times of drought or between the showers the plants must depend on the store of water deep in the soil to maintain growth. This moves upwards towards the roots, in the same way that oil rises in a lamp wick and is known as capilliary action or capilarity. In the case of the soil, it is brought about by the roots and warm atmosphere using the available moisture near the surface, which immediately draws on the lower supply to restore an even distribution. Drained soil, on account of its more porous nature, and allowing the roots to go deeper, continues to supply moisture, and keeps the plants fresh and green long after undrained soil has failed to supply the roots which are kept growing near the surface.

Another important factor of underdraining soil, is that it is a means of supplying food in a proper form for the use of the plant. Soils contain the elements of plant growth in a form which the plants cannot readily absorb, and constant changes must be going on by which these elements may be easily taken up by the roots. These changes are brought about, for the most part by the action of soil organisms which demand the same congenial surroundings as those outlined for the best development of plants. In a drained soil where these conditions exist, the organisms thrive and flourish, combining the elements of the air with those of the soil, and give the plant abundance of available food. In undrained soil favorable conditions keep them inactive or they may be excluded to the utter detriment of the crop.

A five years drainage campaign was carried on by the Ontario Agricultural College, of Guelph, under the instruction of Prof. W. H. Day. The average of many accounts, sent in by the farmers themselves, is $25 per acre for cost of draining, and $20 per acre as the annual increase in crop, made up from the market selling prices of last year. Assuming that the farmer invests the money, in a system of drains, and allows twenty years for its return payment at 4 per cent. interest the actual increase will only need to be $2.25, whereas it is $20. Can the farmer invest his money in any other scheme, which will return $20 on an annual investment of $2.25 for twenty years, and guarantee him an endowment of the same increase, free of cost, for every year afterwards. Surely, such an investment is worthy of consideration.

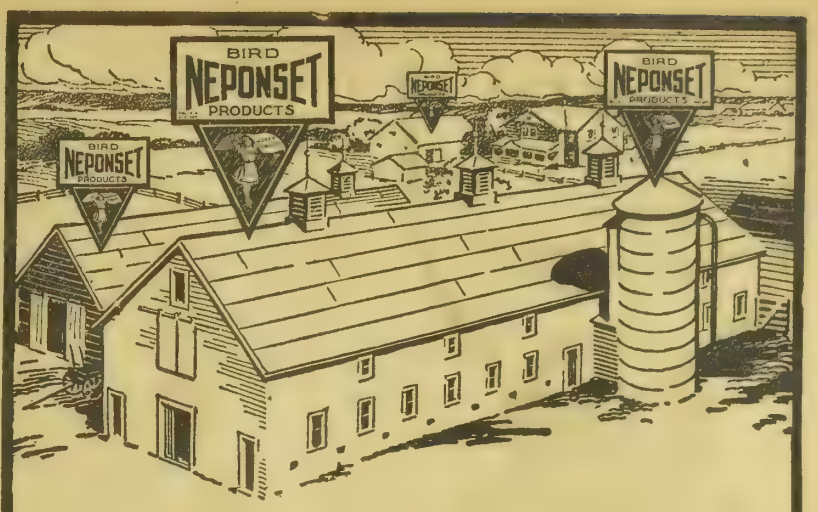
Then, aside from the actual increase of crops, the cultivation may be carried on with more ease to machinery, horses and driver than it otherwise could be on wet soils that cake and defy physical energy to work them into a proper seed bed. On drained land, the old time deep water furrow is unnecessary. A marked contrast may be drawn between the machine moving steadily along on soft smooth land while on undrained land it trundles over the lumps, and every now and then drops into one of those nerve-straining, body-bruising furrows.

Prize winning address in public speaking contest at Macdonald College. Given by W. J. Reid.

Cultivate for Yield.

One of the important requisites in determining the size of the yield in any kind of a crop is the character of the cultivation. It is yet too early to make any more than the most general kind of plans for that work, if one has not already done some of it. The fall plowing which has been practiced by a great many farmers is a most important beginning of the best kind of cultivation. The summer cultivation must be regulated by the amount of crops which one puts in, and by the appliances which one has with which to do that work.

One of the first considerations should be the amount of crops which are to be put in, and right here is where some men make a great big mistake—they put in a too large acerage, more than they are able to give good and thorough cultivation, and it is probble that in a good many cases they would make larger crops and better crops, and, therefore, more profitable crops, if the acerage was smaller. If one can grow one hundred bushels of corn on one acre by improved seed, fertilization and cultivation, would he not be likely to make a much greater profit from an acre and a half of that crop than from three acres which only produced fifty bushels to the acre? And it has been demonstrated that there is nothing at all difficult in the problem of raising one hundred bushels of corn on an acre of almost any old kind of land, while everyone knows that there are thousands of farmers who do not raise the fifty bushels.— Maine Farmer.



Shingles are responsible for 75 per cent. of the fires that destroy farm buildings.

NEPONSET
Paroid Roofing

has saved valuable property from destruction in a great many cases. Where shingles would have served as kindling, NEPONSET Paroid Roofing withstood sparks and saved the building. That is one reason why the great railway systems of Canada use so much NEPONSET Paroid Roofing.

Write for Book of Plans of Farm and Poultry Buildings

There are different NEPONSET *Roofings for different types of Buildings.*
NEPONSET **Proslate Roofing:** For residences and all other buildings requiring artistic roofing and siding. NEPONSET **Paroid Roofing:** For roofs and sides of barns, poultry houses, silos, etc. For poultry buildings, sheds and temporary structures, NEPONSET **Red Rope Roofing** is unequaled.

NEPONSET *Roofings are made in Canada*

HORTICULTURE

Entomology—the Study of Insect Life as Applied to Fruit Growing.

It should be stated as an axiom, that every orchardist should be an entomologist, and I would still further emphasize this axiom. An orchardist may be posted on the qualities of soils and manures, he may understand budding and pruning, he may be an expert packer and grader and know everything that science can teach him except entomology in the profession he has adopted, but if he has neglected the first and cardinal essential for a successful orchardist, that is the study of insects, much of his labor will be in vain, because the success or failure of an orchard is more largely influenced by the insect kingdom, than by any other factor that exists. An orchard cannot exist without the services of insect friends, and it cannot exist either unless insect enemies are kept under mechanical control. It is not necessary that he should be conversant with every insect that exists in his orchard, but it is most necessary that he should have knowledge of those insects which are his friends or enemies, in order that he may be capable of discerning their time and seasons; seeking to foster those which are beneficial, whilst waging unrelenting war on his enemies. Such conditions as these can only be obtained when the orchardist is fully conversant with the life history of the species he has to deal with. Otherwise, whilst his spraying operations are conducted only against his enemies, he is liable to destroy many of his friends. In some cases this can be avoided, but only when the life history of each is fully known and the orchardist is personally familiar with the insects he has to deal with.

It is not within the scope of this paper to enumerate any of the many species which are the orchardist's friends, or to bring to his mind any species which are the continual bug-bear of his daily life, but rather to draw him away from his daily cares to point out how some of these may be blessings in disguise, and capable, under his care, of becoming a large factor in the success of his occupation. But in order that he may be able to take advantage of the work of the beneficial insects, he must master as a first principal the knowledge of who and what they are, the times of their appearance, the various stages through which they pass and the objects they feed upon. Having this knowledge, the natural sequence will be for him to try and turn it to account by seeking to order his spraying operations in such manner as to protect as far as possible the lives of the predaceous insects, whilst the knowledge of the life and habits of the injurious insects would enable him more readily to decide the most valuable point and time at which the action of his spraying will do the most effective work.

It may be argued that all these things are clearly set forth in the bulletins published on various insects but on the other hand no set rule can be laid down as to the emergence of any individual insect or the span of its allotted life. All these things are subject to change, due to environment and temperature and though he may be well read in book lore, he will often find that the data on which he is basing his calculations, is, in his special case, entirely at fault; not because the bulletin was wrong, but on account or some peculiar environment, the insect he is dealing with, has assumed a new role and its habits has changed.

I may be pardoned for giving one illustration of how great a change may happen, and as an example will instance the codling moth. In a few years ago a fruit grower in the west read a bulletin published in Europe or Eastern America, and had based his energies for its control entirely on the facts as stated in the bulletin, that it was single brooded, what a lamentable failure his efforts would appear when he found out that in the west, where everything is big, the codling moth was not to be outdone by any of its western compeers, but that owing to environment, it very often succeeds in producing three broods during the year. This I give as an illustration of what extraordinary changes may take place in the lifetime of an insect when brought under different conditions, and as there are many species of both beneficial and injurious insects known only by their eastern compeers, it can be readily seen how important it is to obtain definite data of the habits of all insects in their different environments, and who so capable of watching and recording these things as the man whose daily life is spent amongst them. His constant watch is kept on the fruit he is raising; ever alert to check the ravages of any injurious pests he may find, and if at the same time he is observing the coming and going of all the insect family that he sees around him, what wealth of information may he not gather, which when applied to the scientific production of more perfect fruit will yield him a rich harvest for his labor.

There is another point to this axiom and that is, that in a new country, such as we have on the Pacific Slope, where large areas are now being brought under cultivation for the purpose of orcharding, there have existed many species of insects, whose natural food plant was one of the native brushes or plants, and so long as this food was left undisturbed, the insects continued their primeval course of life, feeding on the vegetation that existed in their locality, but with the advent of the orchardist the wild bush is destroyed to be replaced by fruit trees, and it is only natural to find that many of the native species, which were thus deprived of their natural home, should rehabilitate themselves on the vegetation which man has introduced.

It has come within my knowledge through observation during the past few years, how this change has taken place in the case of several insects, which have forsaken their original food plant which comprised such trees and shrubs as cottonwood willows and ceanothus to feed upon the leaves of the apple, and I think that it will be found an almost invariable rule that once an insect acquires the apple habit, it will not again retrogade to its former food plant.

The moral of such illustrations as this can only point to one end, and that is, that in order to combat the ravages which such insects as these as may do to our orchards a constant check must be administered by the orchardist, so the query again comes uppermost, who so capable of ascertaining the most vulnerable time at which to attack them as the orchardist himself?

Just one more thought in conclusion, and this has reference to the ravages of swarms of insects as they sometimes occur.

If the orchardist is relying only on the assiatance of the government entomologist or pest inspector for advice in controlling insect pests, and is not seeking to familarize himself with them, when a bad outbreak of any pest occurs he is naturally at a loss to know what preventative measures he should adopt. Being in this quandary he is compelled to seek assistance, and would have to submit specimens of the insect for identification before he could receive instructions for their control. All this takes time to accomplish, and often the damage will be completed whilst he is waiting for instruction for the control of such pests, whereas if he where familiar with even the commoner forms of insect life, he would have little trouble in devising means for keeping the pest in check, and thus avoid the devastation which is so often recorded when a visitation of this description is experienced.

Paper read before the N. W. F. G. A., Vancouver, B. C., by Mr. J. Wm. Cockle, Kaslo, B. C.

Lime Sulphur Wash.

Editor Maritime Farmer:

The ideal spray is one that will control orchard pests without damage to foliage or fruit. Bordeaux mixture is far from being the ideal spray—it has proved effective only, in controlling apple scab and its use is always attended with more or less damage to foliage and fruit. Lime Sulphur, undoubtedly approaches more nearly the ideal spray than anything at present within the reach of the orchardist.

It is equally effective with Bordeaux in the control of apple scab and the most powerful remedy known for the whole tribe of sucking insects, including scale, bark louse, aphis, etc. Not only does Lime Sulphur accomplish its work without injury to the foliage and fruit, but with apparent benefit, lending to the leaves a dark green growthy appearance, and to the fruit a color and gloss that even nature cannot rival. If any further arguments were needed in favor of Lime Sulphur it could be found in its cheapness and ease of application.

As far, then, as orchard work is concerned, Bordeaux mixture, our bulwark against apple scab for a quarter of a century, is down and out, conquered by this new champion from the West, Lime Sulphur. But let no one think that this newer spray will give better results than the older, when prepared and applied carelessly. In the use of Lime Sulphur, care in its preparation and thoroughness in its application are even more essential to the highest success than in the case of Bordeaux. But in the use of Lime Sulphur careful preparation and thorough application will give far higher results than can be hoped for from the use of Bordeaux.

The strength of the genuine Lime Sulphur solution is nearly proportional to its specific gravity. Repeated experiments have shown that a dilution of Lime Sulphur safe to use on foliage and effective in controlling scab should have a specific gravity of from 1.009 to 1.01. A wash weaker than the former cannot always be relied upon to control the scab, while a stronger than the latter, may burn the foliage. In fact, the margin between the danger point and the effective strength of a Lime Sulphur wash for the use on foliage is narrow.

With the aid of a specific gravity hydrometer accurate dilutions of any desired strength can easily be made from any concentrate, home-made or commercial. Divide the decimal part of the reading of the concentrate by the decimal part of the reading of the desired wash, and the figure obtained will show the number of dilutions required. For example, if the reading of the concentrate is 1.292, about 33 degrees Beaume, and we wish to obtain a wash for summer use of a strength 1.009, we simply divide the decimal .292 by the decimal .009. This will give us 32½ nearly, that is we must dilute each gallon of concentrate with 31½ gallons of water, or the number of gallons concentrate to be used is 40 gallons wash, equals 40 divided by 32½ equal 1¼ gallons. For dormant spraying the most approved strength is 1.03.

Proceeding as above, we find the number of dilutions necessary in this case to be .292 divided by .03 equal 9.7, and the number of gallons of the concentrate necessary for the 40 gallons wash is 40 divided by 9.7 equals 4 1-10.

A knowledge of the use of the hydrometer is absolutely essential in making dilutions for use on foliage from the home-made concentrate; and a test of each barrel of commercial concentrate should be made so as to avoid waste as well as the danger of scorching foliage.

The home-made concentrate is equally satisfactory with the commercial and can be made as follows at about one-third the price of the latter. There can be no reasonable doubt but what it will pay all co-operative fruit companies and large orchardists to manufacture their own concentrate.

Formula—1 lb. Lime, 2 lbs. Sulphur, 1 gallon water.

Put 10 gallons water in boiler and start a fire. In this water slake 40 lbs. best stone lime. When slaking is well under way dust in 80 lbs. of Sulphur, free from lumps, stirring meanwhile, and adding water until the whole resembles a thin paste. Now add water till it reaches the 40 gallon mark, and boil for one hour, adding water, preferably hot, from time to time, so that there shall be about 40 gallons of the concentrate at the close. The boiling should be vigorously maintained with constant stirring for the full hour.

The finished product may now be strained into a barrel or settling tank. Sediment produces no effect

upon the specific gravity of any solution and is only objectionable on account of the room it occupies and its tendency to clog the nozzles.

The writer hopes that the information offered on this important subject may prove of use to some of the many readers of the Maritime Farmer. L. D. Robinson, Kings Co., N. S.

Co-Operation in Fruit Marketing in Nova Scotia.

The export of apples from the Annapolis Valley of Nova Scotia has grown from 35,000 barrels in 1893—1894 to 750,000 in 1909—1910. This is but a beginning of what is to come. Ten years will see the output doubled, and twenty years will mean an annual output of from two to three million barrels of apples from this section of the country, one hundred miles long and from five to ten miles wide.

Situated as this valley is, its extremity about one hundred miles from Halifax, an ocean port, with many steamship lines making it their winter terminus, and with good harbors for small steamers at Kingsport, Annapolis and Port Wade, right in the orchards, a system of shipping has grown up that is unique in the history of apple marketing. In the early years of the industry there were few, if any, buyers. The district was removed from the great centres of population, and the quantity of apples was so small that outside buyers did not come in to look after them. London was the principal market, and the early grower individually picked, packed and usually consigned his output to that market. It was all very easy! A dozen English commission houses had resident agents making their headquarters here for the fruit season. These, in turn, had local agents at every shipping station, and the farmer handled his crop, be it large or small, in his barns or cellar, and hauled it in small lots to the shippingstation, where the agent combined them in carload lots and forwarded to the consignee. The consignor heard no more of his goods for about four weeks, when he received his account sales, with a cheque for the net proceeds. This was a species of co-operation, but the profits were all on one side. The transportation companies took a generous slice. The general agent took all his conscience would allow, and divided the pot among his subagents. They, in turn, provided for their subs.

'The greater fleas have lesser fleas upon their backs to bite 'em;
The lesser fleas have smaller fleas, and so ad infinitum.'

Then the consignee charged commission, insurance, brokerage, wharfage, lighterage, cartage, porterage, and half a dozen other 'ages'; or lumped them all in a lot as "our charges." The growers fretted long under the burden, but individuality were helpless.

Ten years ago the export reached three hundred thousand barrels, and a new system was inaugurated to meet the increased output. More storage room was needed, and the erection of frost-proof warehouses on the line of railway was begun. These were built in some cases, by English commission houses, some by local dealers, and some by the growers combining. Here large quantities of apples were collected, packed and shipped under a more uniform system. This, too, was a species of co-operation, but still did not put the profits in the right place. Once inaugurated, the warehouse system grew with astonishing rapidity. The farmer,, who a few years before was growing a few score or possibly a few hundred barrels, was now getting a thousand or thousands. In 1910 every station on the Dominion Atlantic Railway, between Annapolis and Windsor, had from one to six of these buildings from 75 to 150 feet in length and with a storage capacity of five thousand to fifteen thousand barrels each. To these warehouses the fruit is brought as picked from the trees, and here gangs of skilled packers work by day —and often, in the rush season, by night—turning out carloads of straight lots, uniformly and skilfully packed.

Another revolution, quite as remarkable, has come in the past decade. Before the warehouse system was established, and farm packing was the rule, individual consigning was also the rule. In 1900 probably seventy-five per cent. of the output was consigned by the growers, in small lots to the commission men. Now the universal tendency is to sell as picked, 'tree run' as it is technically called, and in 1909, probably seventy-five per cent. of the crop was sold to buyers. Buying apples in the Annapolis Valley, however, is a perilous proposition. The men who can make money buying apples from the Nova Scotia growers must be lighter than they are, and that class of men are scarce. The grower knows too much about the business. He is receiving daily quotations from foreign markets, he knows how to pack and market his own product, for he has been doing this for years. So if he cannot get his price he handles his own stuff. Only a few men of the many who have bought apples have amassed wealth. More have been financially ruined than have gotten out with a whole skin. Buying apples here is no get-rich-quick game. One Ontario man, who entered the field in 1909, is reported to have left thirty thousand dollars behind him when he pulled out.

Co-operation has been talked for years. An attempt was made some years ago to organize the whole district on a comprehensive scale. This scheme, though good in theory, failed through being too large and attended with too much initial expense.

Three years ago, the first successful attempt was made at Berwick. Twelve men organized the Berwick Fruit Company, Limited, incorporation under the Nova Scotia Joint Stock Company Act. The idea expressed by the organizers was to commence on a small scale, put up a good pack, gain the confidence of the market, sell for cash, f. o. b. cars, or if sales were not quick, ship on consignment to good houses. The organization was a success from the beginning. The first year the concern handled seven thousand barrels, getting better prices than the average grower, and earning enough in commissions, etc., to practically pay the working expenses. In 1908, more good men were taken in and the output was about fifteen thousand barrels. More members came in and in 1909, twenty-two thousand barrels passed through the packers hands, netting some forty-five thousand dollars.

The Berwick Fruit Company, in its first year's operation, consigned about one half of its output. A uniform and square deal have gained for their brand reputation that will sell thousand-barrel lots by cable, as readily as by personal interview. This season the output practically all sold f. o. b. cars, at the warehouse and cash or draft attached to bill of lading are the usual terms. The company sells over a wide range. Three cars of Gravensteins were sold in the Canadian West, going as far as Moose Jaw. Five cars to South African buyers at $4.50 per barrel, was a satisfactory deal for both buyer and seller. A feature of the business is that both of these extremes want more of the same stuff. Inspired by the success of the pioneer company, others are being formed. A general co-operative act of the Nova Scotia Legislature makes the process of organizing easy and inexpensive. Five co-operative companies operated last year, handling about one-tenth of the crop. This year ten are at work, all owning their own packing houses and controlling, probably, twenty-five per cent. of this year's crop. As a means of getting nearer together a central organization has been formed composed of representatives of all tributary companies. This central organization has a board of directors and general manager, and we look forward to a not distant day, when the central company will sell and buy for all the subsidiaries. The central company in 1909 chartered three steamers and shipped twenty-five thousand barrels to London in their own ships, saving fifteen cents per barrel, freight to shippers, and incidentally making fifteen hundred dollars clear money, which is laid aside for a rainy day, which is liable to come some time.

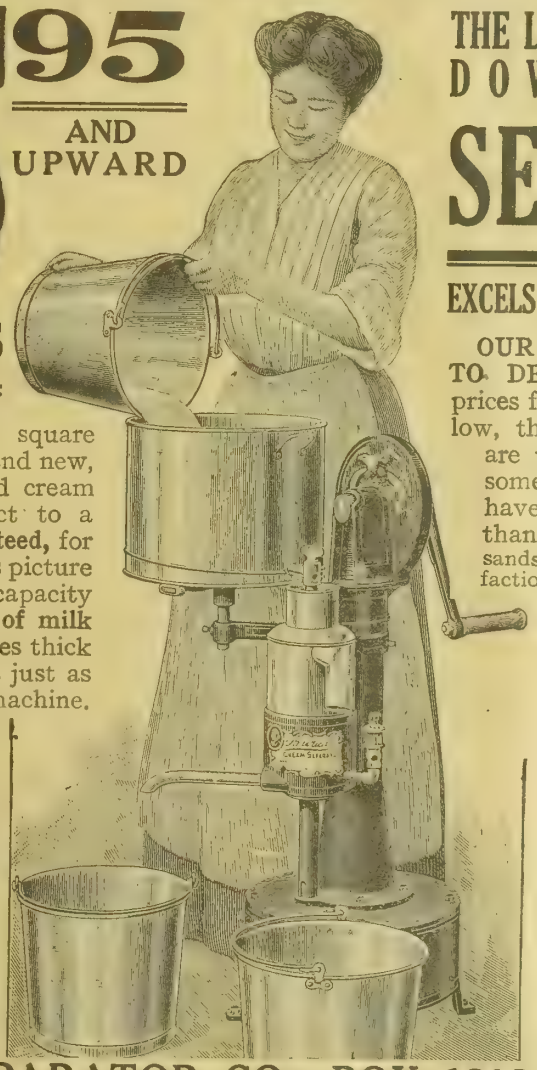
The day of small things in the apple business is past, and the prospect now is, that in a few years co-operative associations will practically control the output of millions of barrels from the famed Annapolis Valley.—S. C. P.

The splendid work of Chamberlain's Stomach and Liver Tablets is daily coming to light. No such grand remedy for liver and bowel troubles was ever known before. Thousands bless them for curing constipating, sick headache, biliousness, jaundice and indigestion. Sold by all dealers.

$15.95 AND UPWARD

THIS OFFER IS NO CATCH

It is a solid, fair and square proposition to furnish a brand new, well made and well finished cream separator complete, subject to a **long trial** and **fully guaranteed,** for $15.95. Different from this picture which illustrates our large capacity machines. Skims **1 quart of milk a minute,** hot or cold; makes thick or thin cream and does it just as well as any higher priced machine. Any boy or girl can run it sitting down. The crank is only 5 inches long. Just think of that! The bowl is a sanitary marvel, **easily cleaned,** and embodies all our latest improvements. Gears run in anti-friction bearings and thoroughly protected. Before you decide on a cream separator of any capacity whatever, obtain our $15.95 proposition.



THE LOW DOWN AMERICAN SEPARATOR

EXCELS ANY SEPARATOR IN THE WORLD

OUR LIBERAL TRIAL ENABLES YOU TO DEMONSTRATE THIS. While our prices for all capacities are astonishingly low, the quality is high. Our machines are up to date, well built and handsomely finished; run easier, skim closer, have a simpler bowl with fewer parts than any other cream separator. Thousands of machines in use giving splendid satisfaction. **Write for our 1911 catalog.** We will send it free, postpaid. It is richly illustrated, shows the machines in detail and tells all about the **American Separator.** Our surprisingly **liberal long time trial** proposition, **generous terms of purchase** and the low prices quoted will astonish you. We are the oldest exclusive manufacturers of hand separators in America and cannot afford to sell an article that is not absolutely first class. You save money by dealing with us and at the same time obtain the finest and highest quality machine on the market. Our own (manufacturer's) twenty-year guarantee protects you on every **American Separator.** We ship immediately. **Cream separators are admitted into Canada free of duty.** Write us and get our great offer and handsome free catalog. ADDRESS,

AMERICAN SEPARATOR CO., BOX 1212, BAINBRIDGE, N. Y.

DAIRYING.

Cow-Testing at the Local Creameries

Despite the efforts of many disinterested workers and the expenditure of much money to spread abroad the gospel of improved milking capacity, the average dairy herd in Maritime Canada still contains several robbers or boarders. These unprofitable workers must be maintained at the expense, first of the remunerative members of the herd, and second, to the consequential detriment of the owner. Is it not amazing in the extreme that an ordinarily intelligent, hard-working farmer will go to untold trouble to keep himself straight along many agricultural lines, and yet will not go to the trouble of testing out the robbers in his herds? Obviously, the cow that is not paying for her keep, or is just returning a mere fraction over and above expenses, is a cumberer of the ground that should be cut down and beefed at the earliest opportunity. If there was anything hard or expensive about this detective process, it would be different. If the subject was at all new objections might be raised against it. But the process of discovering which cows are guilty of larceny is so simple that it passes belief why cow owners will not get down to brass tacks and keep only profitable kine. Cow testing stations are royal roads towards the detection of the robbers of the herd. Why not start a cow testing station at every local creamery? The time involved is not long; the expense is not great. With the Babcock tester and an intelligent manipulator, the robbers may be weeded out of an entire neighborhood within a period of six months. Surely the end to be gained is worth the effort. ...

A Cow's Milk Veins.

We should lay a good deal of stress on the milk veins of a dairy cow. These veins do not hold milk but blood; they are not entering the udder, but are coming from it. Milk is made from blood, therefore the more blood passing through to the udder the more milk we may expect from the udder, and these veins under the body of the cow are the outward sign of the blood supply to the udder. The veins should be numerous, large, and extend well forward.

Suppose a cow just about to be milked should suddenly die. If she had not died, she would have given us ten quarts of milk. To find out where she stores her milk, we have a veterinarian open her body. Search where he will, he can only get less than a quart of milk. The last process in the secretion or making of the milk takes place while we have our hands on the teats. In other words we assist the cow in the manufacturing of her milk. The udder is made up of arteries, veins, tissues, nerves, and millions of tiny cells which contain the material which forms milk. When we press the teats we excite the nerves, they act on the cell and transform the stored up material into milk. Since the production of milk is so largely dependent on nerve force we want to milk quickly, quietly and exhaustively to get the best results. A bad rough milker, or weak-handed boy or woman spoils many a cow. Nothing robs the milk pail so effectively as being abusive to your cow. She can get back at you by giving not only less milk, but milk of poor quality.

Milk is 87 per cent. water and many a cow is humiliated because she has to bring her milk flow down to her water supply. A cow should have an abundance of both water and feed. I am a strong advocate of feeding corn silage, alfalfa and clover hay. One ton of good alfalfa hay is worth in food value a ton of bran. The cow has four stomachs. The first, the paunch, is immense, holding from 36 to 40 gallons. The second is called the honey comb on account of the cavities in the lining. By a muscular action the food is forced from the stomach back to the mouth to be rechewed. We sometimes hear a dairyman say: "The cow has lost her cud," and you would think he wanted you to help her find it. The cow is really suffering from indigestion. Stop her food allowance and give her a dose of salts. The third stomach or maniplies has the lining thrown up into leaves or folds between which the food is rubbed. Too much fibrous matter sometimes collects between the folds causing impaction. In such cases sloppy food and plenty of water and a good dose of salts will greatly help in restoring the cow to health. The fourth is the true or rennet stomach. This is the only stomach a newly born calf has, and is the source of our commercial rennet.

We like to see a long tail. The tail is but a continuation of the back bone.

It is not more, but better cows we want. Half the cows in the Dominion do not give 4,000 pounds of milk a year—not paying for the food they consume. Our standard should be 6,000 pounds of 3.6 per cent. milk or about 300 pounds butter yearly.—Miss Laura Rose instructor in home dairying, Ontario Agriculture College.

Feeding Dairy Cows

These rules are given by Prof. C. H. Eckles, of the Missouri experiment station, where they have developed some of the best dairy cows ig the country, having five Jerseys with records of over 700 lbs. butter fat in a year, and a number of Holsteins with excellent records, amongst others Chief Missouri Josephine, who holds all world's milk records up to eleven months test. Mr. Eckles says:

"It is possible to feed a bunch of cows economically only when they are fed as individuals and not as a herd. A too common practice, even in the otherwise well conducted herds is for all animals to be fed the same amount of grain regardless of the period of lactation or the quantity of milk individual cows are producing. Such feeding always lacks economy, as the high producing cow does not get enough, and while she may milk well for a short time, she soon comes down to a lower level, while the lighter producing cow gets too much and accumulates fat.

The following rules concerning the amount to feed cows covers the case fairly well:

1. Feed all the roughage they will eat up clean at all times.

2. Feed one pound of grain per day for each pound of butter fat produced each week, or one pound of grain per day for each three pounds of milk.

3. Feed all the cows will take without gaining weight.

The rules regarding the amount of grain to feed per day for each cow applies best when based upon the amount of butter fat produced per week as this makes it applicable to any breed. The second part of the rule in regard to feeding one pound of grain for each three pounds of milk would not work out in all cases since in a heavy milking Holstein cow this gives a little too large a quantity of grain and with a Jersey giving very rich milk it is a little too low."

Cream Profits That Stay in Your Pocket

Empire Disc

THERE was a time when the first cost of a cream separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Frictionless, Empir

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest returns for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

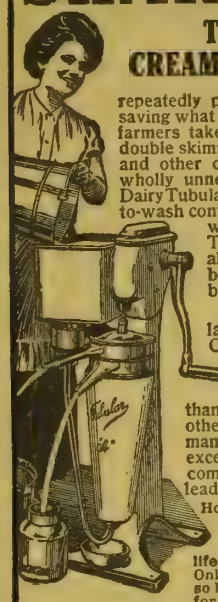
Have Double Skimming Force, So Must Skim Twice as Clean.

That is how

SHARPLES

TUBULAR CREAM SEPARATORS



repeatedly pay for themselves by saving what others lose. So shrewd farmers take only Tubulars. The double skimming force makes disks and other complicated devices wholly unnecessary. So Sharples Dairy Tubulars contain no such hard-to-wash contraptions. Busy women want only Tubulars. These facts explain why all other separators are being discarded for Tubulars.

You can afford a Tubular, for it wears a lifetime. Guaranteed forever by oldest separator concern on this continent. Later than, different from all others. In world-wide use many years. Sales easily exceed most, if not all, others combined. One of Canada's leading industries.

How can you afford any "peddler's" or other cream-wasting, cheap machine, the average life of which is but one year? Only a Tubular will satisfy you, so better get it first and use it for life. If you don't know our local representative, ask us his name. Write for catalog No. 194

Why Keep Poor Cows.

It has been stated on good authority that the average yield of 17,000 cows in the famous Belleville, Ont., section for the factory season of 1910 was 3,480 pounds of milk. There are sections in Quebec where it is doubtful if the average is much over 2,500 pounds. The average income per cow in connection with one Quebec creamery was only $19.60. As some patrons obtained as much as $34.00 per cow, it means necessarily that some cows earned scarcely $15.00. Some primary principles of dairy farming seem to need attention here. Records of each cow's production will soon show which cows should be beefed because unprofitable.

During 1910 the average yield of 1,000 cows in Quebec cow testing associations for the full period of lactation was 179 pounds of fat, double he above creamery average.

Two good records near Winchester, Ont., for January, February and March are 5,725 and 6,570 pounds of milk from two cows that freshened in December. Such cows, sources of keen pleasure and good profit, are found in increasing numbers where cow testing is practised. Plenty of individual cows in Canada are giving 10,000 and 12,000 pounds of milk and from 300 to 400 pounds of fat in one season. Why keep poor cows?—C. W. F.

Water Must be Accessible.

In endeavoring to get the largest possible milk supply from a dairy cow, there is scarcely any other single factor of so much importance as that she shall have, before her, at very frequent intervals, a liberal supply of good water. Even in making beef, feeders have found that a constant supply of water is of great value; in fact, some go so far as to say that the water supply is almost equal in importance to the feed supply. If this be true in beef making, it is much more the case in milk production. When one remembers that a cow giving 50 lbs. of milk a day must give away through the pail alone about 18 or 19 quarts of water and this quite in addition to carrying on all the other functions of the body, it is at once evident that the milch cow must be a very heavy drinker. For her to have to take the amount of water necessary in one or two large draughts of icy water each day is almost an impossibility, and is certainly not conducive to the best dairy performance. The dairy cow should not only have all the water she can drink, but she should also have it at frequent intervals. There is no other animal on the farm for which it will pay so well to put a water supply in the stable as for a high-class dairy cow.

And Still they Come.

Twenty new cow testing associations have been organized in Quebec since the beginning of this year. Twelve new ones have commenced perations in Ontario, two more in Nova Scotia and one more each in Prince Edward Island and New Brunswick. This shows that the dairy farmers of Canada are seeing things in their right light. But it has always been a difficult job to get the farmer to take any steps for his own better education and advancement. Just why this should be so we never could see. Have you a Cow-Testing Association in your District?

WINDSOR TABLE SALT

"Waiter, this is better salt than we get in the States".

"Yes sir, that's what all the tourists say.

We always use Windsor Salt in this hotel. In fact, practically everybody in Canada uses Windsor Salt for the table."

"There, my dear, is a hint for you.

Now that we are going to live in Canada, we must start our housekeeping right with Windsor Salt.

Put the name in your 'want book'—

WINDSOR TABLE SALT". 45

We Now Have Ready for Delivery

The New Capital Separator

You will recognize at once the LOW TANK feature of this type and the solid yet attractive appearance of the machine as a whole. THE BOWL is the same as we always used. The lightest, most compact, easiest washed bowl on the market. BALL BEARINGS are used throughout the machine, thereby reducing friction to a minimum, making the machine extremely easy to operate. THE GEARS run in a film of oil produced through the phosphor-bronze spiral gear wheel being continuously immersed. The same CLUTCH DEVICE that has made the Capital famous has been adapted to this type, so that when the handle stops all gears, except the one running in the oil, are instantly stopped, and nothing but the soft whirling noise of the bowl can be heard. WHEN GEARS DON'T RUN THEY CAN'T BE WEARING. This advantage is apparent to every one. Notice also the high crank; the centre of the crank shaft being about 2 feet, 9 inches from the floor, which permits the operator to assume almost natural position when turning. This type is made in two sizes, No. 6, capacity, 500 lbs. per hour; No. 8, capacity 750 lbs. per hour. We are **not** discarding the former style of Capital, which has deservedly won many friends, but we are introducing the above style so as to give purchasers a variety to choose from.

A postal will bring you full particulars of our Free Trial Offer. Address nearest branch.

LIVE STOCK

Raising Hogs on Dairy Farms.

A wealthy meat packer stated once to the writer that the profits in his beef business consists entirely in what he is able to save in materials formerly wasted. The smaller butcher usually throws away what the large butcher turns into money. The means employed by the latter could not be adopted by all small butchers, but the thought that waste may be eliminated and savings effected through intelligent study of materials such as are neglected by others is good enough for universal application and can be applied in the case of the farmer just as well as the case of the packer or manufacturer.

There is, on all farms where dairying is a specialty, a large amount of what may be called waste material, such as small potatoes, house refuse, etc., which might well be converted into cash by transforming it into pork. The hog is always ready and willing to accommodate his owner along these lines, says W. D. B., in the Alberta Homestead.

With live pork ranging from 7c to 8c per lb. live weight, one can readily see that the more hogs we can turn off, providing they fill the place they should, viz., as waste consumers the more our bank account will swell.

The first problem is how to get the hogs to fatten. One way is by depending entirely on the stock hogs, which is not very feasible in this western country at present, and the other is by keeping brood sows and raising pigs. One objection to the first is that the stock offered for sale is usually poor and the seller knowing that you have to get your hogs this way, wrings the highest price possible out of you.

For all purposes, a good purebred animal is the best for the production of purely market hogs, as well as for the production of purebred animals for breeding purposes, but the man with limited means and perhaps also a limited knowledge of the value of different animals, will be able to succeed by starting a herd with grade stock. The man who has a well-selected grade herd and is producing hogs for the pork market, will do a great deal better than the man who is producing pork hogs from a purebred herd that has not been so well selected. In selecting, pick sows of good shape, good feeders, prolific, reasonably quiet and easy to handle and mate them with a purebred boar of good individuality and breeding, whose offspring matures early and fattens easily.

A sow that is properly fed and handled before and after farrowing gives little trouble. She should not be heavily fed on milk producing or heating feeds a week before and a couple of days after farrowing, as this stimulates milk production which is likely to cause either milk fever or caked udder. A sow should not be fed more than enough to enable the pigs to take what milk is produced. A week or so previous to farrowing, her feed should be gradually reduced while at the same time the bulky nitrogenous parts of the ration should be relatively increased.

Immediately after farrowing she should be left as quiet as possible and only warm water given to her. The following day she may be given sloppy feed, skim milk, bran and oats. Within a couple of weeks she may be increased to a full ration. If fed too much after farrowing there is a tendency to bring on a feverish condition of the udder and body, which often causes an abnormal appetite for flesh. The end of March appears to be a good time for the spring litter to come and the fall litter should be farrowed in time to give the pig a good start before the real cold weather sets in. If bred systematically two litters can be had year after year, and each fit in just right.

A sow should be handled with the greatest care and gentleness at all times. When the sow is about to farrow it is best to put her in a pen by herself, where a 6x4 piece of scantling has been nailed to the sides in the corner where the bed is at about eight or ten inches from the floor. Chaff or cut straw should be used for bedding, and this, as well as the scantling will help protect the young pigs from being mothered by the sow. After the pring litter is weaned the little pigs should have all the milk they will drink clean with a little middlings or ground wheat in it. It is best to feed the milk with as much animal heat in it as possible, for there seems to be some vital force of virtue in he animal heat. Judgment must be used in the amount of skimmed milk fed to young pigs. In addition to this it is best that they have a run or a small pasture lot. Be sure the ence surrounding this is good. The young pigs love to roam, and many a dairyman knows to his sorrow the mischief they can get into and the damage they can do. Pasturing hogs however, is one of the cheapest and healthiest ways of raising them, for it gives them good large, strong stomachs, good digestion and puts good legs under them. This all counts when the pig is put in to fatten at say five months old, for he is able to stand heavier feeding and makes cheaper and quicker gain.

A pig is half made when past the weaning period without a stunt or set-back in its growth. Each check or halt in its prosperity through its first two months is more expensive than at any later period, so it pays to pay close attention to feeding at this time. Too much rich feverish milk of the dam may leave harmful results and cause more injury to the growth of the young pig than scant feeding.

From the first week after farrowing until weaning time, the sow will be little less than a milk machine, and to be a high power machine in perfect operation she must have proper care. Nothing is so well calculated to make pigs grow as a bountiful supply of wholesome sow's milk, and the pigs that have plenty of other feed, such as skim milk, and middlings, with the milk of a well slopped sow for eight weeks will ordinarily have much the start of those weaned at five or six weeks. No great check in the growth of young pigs will be noticed at weaning time if they have been taught to eat some weeks before. Another point to be emphasized in feeding pigs, is to give them a sufficient supply of water. Young pigs need a larger quan-

INTERNATIONAL STOCK FOOD CO., Ltd., TORONTO, CAN.
INTERNATIONAL STOCK FOOD
THE GREAT ANIMAL TONIC
Is sold by over 100,000 dealers on a spot cash guarantee that its use will cost you nothing unless you get paying results. If it ever fails your money will be promptly refunded. International Stock Food is a strongly concentrated medicinal preparation composed of roots, herbs, seeds, barks, etc., and is equally good for horses, colts, cows, calves, hogs, pigs, sheep, goats, etc. It is fed in small amounts mixed with grain and purifies the blood, tones up and strengthens the system and greatly aids digestion and assimilation, so that each animal obtains more nutrition from all food taken. It is not amount of grain fed but the amount assimilated or taken into the system that fattens or keeps your stock in good condition, and as International Stock Food increases assimilation it will save you money. It will make you more money than you can possibly make without its use. It also cures and prevents many forms of disease, and is absolutely harmless, even if taken into the human system. International Stock Food is endorsed by over two million farmers who have used it for years. The editor of your farm paper will tell you we do exactly as we agree, and as reference we give you the Traders Bank of Canada.
M. W. Savage, sole owner of "International Stock Food," and also of "International Stock Food Farm," positively Guarantees that His World Famous Champion Stallions, Dan Patch 1:55, Minor Heir 1:58, Hedgewood Boy 2:01, Geo. Gano 2:02¼, and his brood mares and colts eat it every day. You are specially invited to visit this Great Harness Horse Breeding Farm ten miles from Minneapolis, and see the practical results of the every day use of the greatest purely vegetable animal tonic ever used on a farm. It is constantly used and strongly endorsed by over Two Millions of the most up-to-date Stockmen and Horse Breeders of the world.
PROVED ITS INVALUABLE WORTH.
The International Stock Food Co., Toronto, Ont.—Gentlemen: I feel in honor bound to offer you my testimonial in favor of your Stock Food. I have used it faithfully this summer and proved its invaluable worth. It made my pigs grow, the results were simply marvelous. I would not be without it for anything. My horses got a very nasty distemper cough in the spring, but the food cleaned it completely out of their system and they went through the Spring work fine and came out of it rolling fat. Please duplicate my last order. Mrs. Coe requests me to tell you that your Poultry Food is excellent, that feeding your Poultry Food doubles the quantity of eggs, in fact, it could not be better for egg production and keeping the fowl healthy.—Yours sincerely (sgd.) ALF. R. COE. KEHO, ALTA, 10-10-10

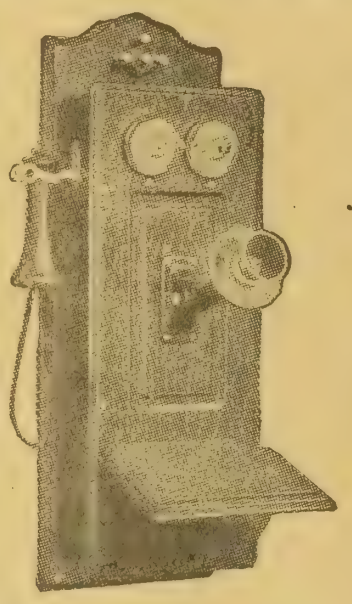
Order your telephone supplies from us.

Prompt shipments and guaranteed satisfaction



At this season of the year, when new companies are constructing telephone lines and old systems extending their service, the demand for telephone supplies is heavy. But you can depend upon getting prompt service from us, because we always carry a large stock of all materials necessary for the construction of a telephone line, and because we make a specialty of prompt shipping.

It will be to your advantage to get our prices on telephone supplies before placing your order. Our telephone materials are of first-class quality and fully guaranteed. On request we will send one or two telephones for a free comparison trial.

Post a Letter to-night and ask for our No. 2 Bulletin (Rural Lines.) Also tell us to include our latest and most interesting publication, a handsomely illustrated book called "Canada and the Telephone."

CANADIAN INDEPENDENT TELEPHONE CO., LIMITED,
1820 Duncan Street, Toronto.

tity of proportion to weight than those older. The best results have been obtained by feeding the bulk of the water after the rest of the feed has been eaten. Another point is to give the pig free access to a variety of mineral substances so that he can supply according to his appetite whatever is lacking of those minerkls in his food. These substances may be salt, charcoal, bone meal, wood ashes, clean soil, soft coal cinders or phosphoric limes. Ear y maturity in general is brought about by feeding an excess of non-nitrogenous nutriments or by sudden changes from nitrogenous to non-nitrogenous. The reason for this is that in feeding non-nitrogenouss nutrients, the pig does not have sufficient protein upon which to make extended growth. Therefore he will lay on fat and discontinue to grow. The change in the ration should be made gradually so as to avoid any chance of getting the pig off feed and keeping the co-efficient of digestibility at a minimum.

Sore Feet in Cattle.

There are many forms and causes of sore feet in cattle but the ordinary breeder is not so interested in the cause as he is in the successful treating of same.

It is very important to keep barnyards and stables so thoroughly cleaned that cattle are not obliged to walk through any pools containing urine or filth, as in many instances their feet become infected by so doing and perhaps the first symptoms of this disease will be noticed by heat, swelling and lameness.

Upon close examination it will be noticed that the hide between the claws has cracked and become infected, which produces this disturbed condition and as the soreness and inflammation are intense, it oftentimes interferes with the general condition of the animal, causing a decrease in appetite and a rapid loss of flesh.

Perhaps the most successful manner in handling such cases is to put the animal upon a tonic to increase the appetite. The feet should be thoroughly washed out with an antiseptic solution and then apply an antiseptic poultice, which has a tendency to remove the heat swelling and inflammation.

New Problems With Sheep.

Why do sheep sometimes bear twins, triplets and even litters? If some ewes do this, why may not all ewes become equally prolific? Why do ewes have so mony rudimentary teats, besides those which the lamb sucks? Did sheep formerly bear more lambs than now, or can they be bred or fed or feared so as to become more prolific? Can the milk glands of the ewe be so developed that she may suckle a whole litter of lambs, just as a sow does?

If No, to any or all of the above questions, why No?

Many a man of long and successful experience with sheep will at first laugh at these questions. But Dr. Graham Bell, inventor of the telephone and other great improvements, has been experimenting along these very lines with sheep for years. As a result he believes that most of the questions above cited can be answered affirmatively. A sheepman who had talked to Dr. Bell without knowing him, when asked what he had been told, replied:

"Well!" he said, "I have been raising sheep all my life, own thousands of them now, but that man has told me more about sheep than I ever dreamed of."

Familiarity with live stock should not blind one to the ever-present mysteries or possibilities of nature!

Taking the Burden Off the "Everitt" Owner

AUTOMATIC devices for oiling—positive timing and valve action—unusual accessibility to working parts—simplicity of design—low up-keep cost—Tudhope protection after purchase—these make "Everitt" driving the twin-sister to unalloyed pleasure.

IT is an "Everitt" characteristic to make each part of the car self-caring, self-attending—dependable. "Everitt" owners have motoring pleasures to the full. Could more *real* return be had in a car at $1,450?

"Everitt" parts are few, simple and strong. Each part is made with positive accuracy. Large wheels, unit-cast motor, saved weight, roominess, a finish excelled nowhere else—these are some of the achievements of "Everitt" design. "Special Tudhope Equipment," including Extra Tire,—and 2 Years' Guarantee—these complete the car as a purchase of excellent value at $1,450. Get the Catalogue.

Sheep Pointers.

Be quiet among the sheep.

An orphan lamb may be given a ewe that has just lost a lamb if the dead lamb is rubbed over the strange one.

Sheep need a change of pasture. Change them often from one place to another, putting them where it needs cleaning up.

Oil meal will often prevent indigestion and keep the young sheep on edge.

Sheep should be given salt every day. Once a week is not sufficient. They will not eat too much.

Don't let the sheep get wet. Takes a long time to dry out their heavy coats of fleece. Provide shelter. In case of storms it pays big.

If a ewe dies her fleece will pay her funeral expenses; if she lives, her spring wool and lambs pay more than double revenue.

If you notice a lamb going lame examine its feet at once. Sometimes a small stone or tuft of grass wedged between the toes will cause lameness.

THE ORIGINAL "HALLOCK" WEEDER.

The object of a weeder is to keep down the weeds, therefore, it resolves itself into this one fact: that a weeder should be used early and often, so as not to give the weeds a chance to grow. You will not injure your crops by working the ground directly over the plant or grain, but will do much toward increasing the growth and yield.

You can work them in wet or dry weather, they will not cut the roots of the crop, but cultivate just deep enough to retain the moisture just where it is needed. But, do not forget the old rule—use the WEEDER early and often, and when you are all through with all kinds of other cultivators, our weeder will finish your job in No. 1 shape. Thousands in use. Write for prices and terms.

Send in your order now for the "HALLOCK" Weeder. Goods are now in hand, all orders will receive our prompt attention.

THE HORSE.

Size and Quality Combined in Horses

There is a mistaken notion abroad among the uniformed that grit, endurance, longevity and superior quality of bone and feet are not found among draft horses in such perfection as among horses of less size. There are more soft horses among the big ones than among the small ones, it is true, but the best draft horses need no apologies on the score of those sterling attributes of temper and quality that make a horse as willing and as able to forge ahead with the work in the afternoon as in the morning, in midsummer as in winter, and at 20 years old as well as at three. A man may choose the kind he wishes. He may take, just because they are big, some coarse-haired, loosely-made, sleepy-eyed round-boned, flat-footed duffers, and later be disgusted with their inefficiency; or he may demand size with fine hair, sturdy compact build, keen eye, flat bone and wide deep feet. He can find horses with those qualities, and they are the ones to tie to. The vast number of big draft horses that work to a great age and still remain sound and supple furnish constant proof that the usefulness of draft horses is not confined by any such limits as some men suppose.

Draft horses are at their best in work at a walk, but judges and breeders rightly demand that they shall be able to trot smartly and well. Any day in Chicago one can see draft horses weighing close to a ton trotting along the streets. Perhaps they are loaded with several tons of goods and the driver wants to reach the next corner before leaving the car track at the demand of the clanging gong, or there is a hurry-up call for the delivery of the load somewhere, or it may be that the belated teamster is merely hurrying home with his empty wagon. Sometimes one sees a good shapely chunk, weighing perhaps close to 1,500 pounds, tearing down the street at a gallop with a load of express packages or newspapers. To be sure the horses that remain sound under such driving are not the coarse wooden-legged kind, but horses with big flat bone, legs set mechanically correct, and feet of ample size, deep as well as wide. The fact that big horses can stand such strain should encourage farmers and breeders to set their mark more steadfastly toward quality with size.

There never has been a time when toere was a greater opportunity for the breeder of draft horses in this country than now. Both farm and city want draft horses. But men are waking up to the fact that a horse must have many other attributes besides weight. The enduring quality counts in dollars for the breeder as well as in work. The service of a really high-class draft stallion with ancestry like himself, is worth several times that of a horse that is his equal only in size. The owner of pure-bred mares must be especially careful in his selection of a sire if he is to meet the growing demand for horses that are at once nimble, enduring and weighty. Such horses are now being bred. It pays to secure that kind of foundation stock. Pure bred mares of such type have great money-making ability.—Breeders' Gazette.

High Class Horses.

The National Bureau of Breeding will have at the Ottawa horse show what is said to be as fine an exhibit of thoroughbred stallions as was ever seen in the ring in Canada. In the lot will be Masterman, by Hastings-Lady Margaret, winner of first prize at the New York Horse show last year; Earl Rogers, by Sain-Sister to Uncle Bob, winner at the Toronto fair; Valjean, by George Keseler-Missy, winner of 103 races and the oldest thoroughbred sire in Canada; Rosemount by Hastings-Lady Rosemary; winner at Montreal Horse show, Anger by Hindoo-Olga, winner at ridgeport and other shows; Blue Coat, a handsome son of Ben trome by Bend Or; Athel, the brown on of the Irish stallion Atheling, nd others.

This exhibit is valued at over $40,000 and all these sires have been placed free of charge in Ontario and Quebec farms and came as donations to the bureau. The horses are being shown by the farmers themselves and every horse is being prepared by the armer or breeder at whose farm he s stationed.

The bureau has sent the fine young hestnut stallion Arawak by Pontiac-Anna Daly to Thomas Babe, X. S., Shelborne, Ont. Anawak is the finest looking thoroughbred ever produced in the world-famous Rancocas stud.

Beau Gallant by Jim Gore by Hindoo, dam Bonita Belle by Falsetta has been placed with W. D. Soles at West Brome, Que. Beau Gallant was bred by General Sanford at the Hurricane stud, raced by S. C. Hildreth, in whose colors he beat the great Commando in the Matron stakes at Morris park, and was sold by Hildreth to Richard Crocker for thirty thousand dollars. From Mr. Crocker he went to Major W. A. Wadsworth, master of the Genesee Valley hunt, and by Major Wadsworth was donated to the Canadian bureau.

The National bureau expects four more sires soon and these will at once be sent to Canadian farms! One will go to Dr. Shaw, Indian medical superintendent at Manitowaning, Manitoulin Island, and another to Fort William, Quebec, near the Petawawa training camp. The others will be sent where most needed and it is no easy matter to decide this part of the work, for the demand for these sires has increased until there are now over 1,500 farmers and breeders on the waiting list. Some of these men have been applying for three years.

You Never Can Tell.

The English thoroughbred horse, Birmingham, which won the St. Leger of 1830, had a curious career. Bought as a foal, he was soon afterwards taken ill and became so weak he could not stand up to feed. Having a great dislike to see an animal suffer, Mr. Beardsworth proposed to destroy him, but was dissuaded by his wife, at whose urgent request the horse was carried by four men to a private box near the house, where the lady made him her special care. He remained for a month without showing improvement and Mr. Beardsworth several times urged that humanity required his destruction. Mrs. Beardsworth resolutely opposed it having, she declared, a presentment that Birmingham would recover and win the St. Leger. This he did in a field of twenty-eight runners, Priam finishing second and Emancipator third.

A touch of rheumatism, or a twinge of neuralgia, whatever the trouble is, Chamberlain's Liniment drives away the pain at once and cures the complaint quickly. First application gives relief. Sold by all

Horsemen Attention !

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as, Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

AFTER USING.

Use this preparation thoroughly for all and every disease of the horse for which it is recommended, Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on its merits, you will be compelled to endorse it.

TESTIMONIALS :

DEAR SIR :—I had a mare which had a very bad cough and heaves for almost six months, and became so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it. Very truly,

RODERICK McKENZIE.

Hillsboro, N. S.

DEAR SIR :—I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contraction of the hoof. W. A. C. RANDALL, M. D.

March 28th, 1911. Hawkshaw, N. B.

MESSRS. FRASIER, THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable.

(Signed) WALTER SLATER, "Cash Livery."

FRASIER, THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market, and am never without your Liniment and Condition Powders in my stable.

HOW MEN ENDURE

The Oat-Fed Man Can Outwork All the Rest

A concern which employs 2,000 woodcutters made scientific tests of food. The result has been to prove oatmeal the great endurance food. Those workers now all start the day on a diet of oats alone.

No other grain supplies the energy of oats. You know the affect on horses. It is just the same on man. Any man can increase his endurance, his vim and vitality by eating more oats.

That is why oatmeal is so immensely important. In this food above all foods one should insist on the utmost. It is not a wise thing to serve common oatmeal.

The rich, plump grains used in Quaker Oats are selected by 62 siftings. Only ten pounds can be obtained from a bushel. But those choice grains have richness and flavor, and the maximum value as food.

Quaker Oats is the cream of the oats made delicious. Yet, despite its quality, the cost to you is but one-half cent per dish.

Made in Canada. (170)

POULTRY.

The Highest Priced Poultry.

The poultry that realizes the highest price are crate-fattened birds, and while we receive the largest proportion of these from men and firms who buy the poultry from the farmers at a certain price live weight, and then take and fatten them for the sake of the profit that is in the business for them, yet we are today receiving an increased quantity direct from the farmers. I am pleased to say that a great number of them are beginning to realize that there is money in taking some of the materials they have on the farm and putting them into poultry. They are also beginning to realize that it does not pay to keep inferior breeds of poultry or any live stock, as the cost of feeding and attention are the same in each case, whereas the results of the one are not to be compared with the results of the other.

There is no excuse for a farmer remaining in ignorance as to what are the best breeds of poultry to stock his farm with and what fowls will give the best returns in eggs and be most suitable for fattening and marketing when their usefulness has ceased. Certain breeds of fowls produce better eggs and are also more suitable for table use than others; these are the ones that attention should be given to.

If each farm kept an average of poultry equal to what I have indicated, we can easily figure what a large increase there would be in the quantity of poultry, which today is so much in demand, and of which we are not able to secure a sufficient quantity to meet the demand. It will probably be new to know that although we have been in business so many years we have never refused to buy eggs or poultry when it was offered to us by producers.

The high price of meats today has stimulated the demand for poultry, so that for the last few years a steady advance in the prices have been realized. Then, again, the development of the West has created new markets; this has absorbed the supply which in former years used to be exported, so that the total of our exports for 1909, including live and dressed poultry, only amounted to 109,290.

When we realize that the British market imports about $5,000,000 worth of poultry from various countries, you will form some idea of the possibilities for the development of this industry, and as the demand in the United States continues to increase, that markets will also offer an outlet for our future production, so as far as the outlet for supplies is concerned, it is almost unlimited.

I need hardly state to you that foreign buyers always look to these markets that can furnish a liberal and continuous supply; our inability to do this has practically cut Canada off the list of those buyers in Great Britain who would be only too pleased to forward their orders here.

Now another factor that has militated against our developing this business has been the poor standard of quality that the average poultry market furnished. I am very pleased indeed to express my approval and appreciation of the efforts of various poultry associations in trying to develop a higher standard of quality. The difference in price between poor poultry and good, or between lean, inferior birds and those in proper condition for killing is so great and so self apparent that I need scarcely enlarge upon it here, but I feel that I must draw your attention to figures once more, as they represent the dollar and cent side in which all are most vitally interested. I believe that I am safe in saying that only 50 per cent. of the poultry is marketed in proper condition. In a letter I received from the Hon. Mr. Fisher, he stated that it was estimated that the number of poultry of all classes sold or killed in Ontario in the past year was 4177,583. Figure this quantity at say five pounds per head to count chickens, turkeys, ducks and geese and you have a total weight of 20,587,915, on 50 per cent. of which there is easily a loss of 3c. per pound due to want of care in preparing for market or in other words, the farmers of Ontario lost last year $301,818.74; surely this gives food for thought.—John A. Gunn in Canadian Farm.

Science in Raising Geese.

Raising geese is a science just as well as any kind of poultry raising, says a writer in Poultry Journal. By letting geese raise themselves I have found that they will do silly things; for instance, stand by their mothers and drown in a rainstorm when the old goose would gladly shelter them. Geese always do best with a goose mother, but they must be kept out of the rain, as water is fatal. Not until they are about six weeks old can they stand much of it. I have raised goslings in brooders and would do this altogether were it not for their tendency to stray off. A goose mother will keep her brood together, but when the goslings have no mother they will separate and sometimes stray a great way from home and be unable to find their way back. Last spring I had a small ratproof house built especially for raising geese. The mother goose is confined with her family at night and on rainy days. Next spring I intend putting a brooder in the house and teaching the goslings to go into it while the mother goose stays in the house. In this way she can care for a large flock of youngsters.

I use but one goose for raising my flock, and whenever I give her a bunch of newly hatched goslings she hails them with delight and gives them a hearty welcome. By the middle of June her family is of all sizes. Goslings will grow well on grass alone, especially on clover, but will do much better if fed once a day with all the cracked corn they will eat. I have never seen an overfed gosling; yet goslings will fill their necks until they must crane to get it down, take a drink, then eat some more.

HARROWS.

In these days of expensive labor you can't afford to buy any harrow but the one which will do your work best and quickest—'twon't pay you.

Our Lever Harrow is a great one;—best there is going, by long odds. 'Twill harrow steadier, and just to what depth you want it. Then you can regulate the draft on the horses and get the greatest amount of work for the least pulling.

A touch of the levers and the teeth are just where you want them at each round; not too deep at first, to ease the horses, then afterwards when the top soil is loose, throw them down and you're getting something done.

Saves time because less scrapes do.

Love's Barrier.

CHAPTER II.

A WOMAN IN THE CASE.

They met several times after that. In fact, every morning found Secretan haunting the pond in the Luxembourg Gardens, in the hope of seeing Helen Revell. She always seemed pleased to see him, and they had many intimate talks; while Geoffrey and Margot, approving of the tall stranger who knew so much about boats, and was neither too big nor too solemn for play, never failed in their boisterous welcome.

Secretan quickly learned that the woman who interested him so deeply was intensely unhappy in her present mode of life; also he discerned some care upon her heart other than that of passionate regret for the father whom she had so ardently loved. That she was of birth far superior to his own he had easily gathered; her father had been an army man, and all her connections seemed to move in military circles. The Revels themselves seemed to be very poor, however, eking out a somewhat harassed existence in a garrison town on strictly limited means.

To say that Secretan was deeply interested, inadequately describes his frame of mind. He bade her goodbye with a very poignant regret, while a determination to see her again had already taken possession of him, and would not be set aside.

"Promise me," he said earnestly, as they strolled together for the last time under the spreading trees. "Promise me that if you ever need a friend you will apply to me."

"That is a promise easily given," she answered with a faint light in her wide grey eyes. "I have not so many friends that I can afford to despise an offer so sincere."

"I should have imagined you surrounded by troops of friends," he said a little consfusedly, fully aware that the remark was a little more personal than their brief acquaintance justified.

She laughed a little, and the bitterness in her voice was insistent.

"I am really a quite friendless woman. You can't know the life of a garrison town, its petty jealousies, its horrible cruelty. To be happy in it one would need to be wholly independent, to be able to soar clean above it all, to put one's foot on its neck, so to speak. I have never been in that enviable position."

"Would it not be better to leave a place so uncongenial and so unpleasant?" he asked perplexedly.

"I have often thought of that, but the way is barred. It always id barred to the solitary woman, without gifts and without resources."

"You belittle yourself," said Secretkn earnestly. "You dare not say you are without gifts."

"At least I have no marketable ones," she said swiftly," and, besides, we are hide-bound by tradition and convention. One may starve and not altogether lose caste, but work ——!"

She ended her sentence with a small, significant shrug of the shoulders.

Secretan was silent a moment, recalling indeed the small linendraper's shop in the Somerset town where his father and mother had pursued an unblemished, but perfectly undistinguished, career. His own striking success at school, the winning of a substantial scholarship, had enabled him to leave the environment which, to do him justice, he had never learned to despise, though he was perfectly aware that others despised it.

"I think, if one has courage," he said slowly, "courage conquers every thing. I cannot bear to think of you eating your heart out in that garrison town, living a life that is carving so many unnecessary lines on your face."

"I know I am getting old," she said with a little sign. "Mrs. Revell is always remarking on that cheerful fact. She has the baby face, and adopts the air of innocence, though within she is as wise as a serpent. Oh, how you must despise me for talking like this, but, believe me, it has been a relief! You have been so truly kind, and seem to understand; but I feel that I shall die of shame after I am home, thinking how I have given myself away. My father did not teach me that. He was a brave soldier. He always told me to stand up to the guns."

"You are in the wrong place," he said gently. "I hope that one day soon you will find your right niche. Now, shall we ever meet again?"

"Oh, we may! The world is wide, and nobody knows what a day may bring forth. But I won't forget our talks. And I shall recall your ideal of duty when I am harder beset than usual. I think it will help me to think of you pursuing it under difficulties in your moorland parish."

"But I am not unhappy," said Secretan with a feeling of uneasiness because of the false impression he had made. "I am poor, of course, but I have congenial work, and no particular fight with fate."

"Poverty is nothing, nothing at all. I have a hundred pounds a year of my own, and, though it goes into the common good now, I sometimes wonder whether it would be possible for an unattached female without expensive tastes to live upon it. Well, good-bye. I assure you thpt in Colchester I shall often walk in spirit in the Luxembourg Gardens."

"May I write to you?" inquired Secretan, feeling that he could not let her drift out of his life like this.

She shook her head.

"Don't. It would be better not, I think. I prefer these memories. Let us remain like ships that pass in the night."

Her tone was final, and Secretan was obliged to speak the hateful word. But as he wended his way to his lodgings to get his things together he felt that something had gone out of his life, leaving behind a very sharp sense of loss. He did not think of love; the idea of learning to love a woman in five days would have upset all his preconceived ideas on that alluring theme. But he was haunted by a pair of sad, somewhat mocking, grey eyes, by the pathos and sweetness of a woman's mouth, by his own passionate desire to have some share in the guiding of a purposeless, and therefore unhappy life.

He tried to put it behind him manfully, and to address himself in thought to the waiting duties which for the moment did not beckon him. He slept the night in London, paid a few calls next morning, bought some needful books for which he had resolutely kept back a portion of his holiday money, and after lunch took train for the greyer North, where he arrived at dusk, to find a chill bitterness in the air, and an unkind rain falling from the leaden skies.

The glow and brightness had disappeared, and the weather seemed typical of the grey vista in front of him. When a man returns in such mood to his own niche it may be inferred that something serious has intervened to make upheaval in his life.

Midcar was reached by a small branch line crossing the moors from Guislip Junction, and as the train crawled up the misty slopes Secretan wondered when he should see Helen Revell again. That he would see her, he was in no doubt at all. Should he tell Jane about the incident of their meeting. He doubted it. Jane would hardly understand.

She was standing at the station, a motionless figure in the falling rain, her angular lines not enhanced by the ugly folds of a shabby and very wet macintosh, but the face peering out eagerly from under the brim of her serviceable but singularly unbecoming hat, was wholly redeemed by her eyes, which were really beautiful; filled with the soft, expressive light of welcome. Jane was in reality a far finer character than her brother. Though naturally clever, as well as good, it had been early impressed upon her that it is a woman's portion to stand aside, to wait, and to further ambitions in which she can have but little part. She was thus only partially educated, but her passionate thirst for knowledge had driven her to such self-culture as is to be found in books. She was musical also, and had laboriously taught herself enough to play the little organ in the church, where her sympathy of touch made up for the technical errors which sometimes jarred upon the critical or casual visitor.

Constant abnegation, however, had not embittered Jane Secretan's fine, sweet, wholesome nature, and her happy fund of humor, which enabled her to laugh in the most unexpected places, had taken the raw edge off many a bitter moment. Secretan had never fully appreciated her. During the years of his school and college life he had drifted, perhaps inevitably, out of touch with his home people, and though he was fully aware what an excellent almoner of a poor man's income his sister made, it had never occurred to him to regard her as an intellectual companion. Secretan was a preacher first and a pastor afterwards, and Jane's practical help in the parish was quite invaluable.

His splendid pulpit gifts had been curiously overlooked by his Church, and Jane sometimes resented the fact that he was buried untimely in their moorland parish. They had now been seven years in Midcar, and Jane knew that a change would be beneficial to him, though personally she would regret to leave the place where she was happy, where she understood the people, and where she was so greatly beloved. In the love of the best women there is always the mothering element, and Jane's eyes were eloquent as she stepped forward, almost as an anxious mother might have done, to welcome her returning boy.

"There you are at last, dear!" she said in her strong, pleasant voice, which at the moment had a strangely irritating effect upon Secretan, He inwardly compared it with the soft music of the voice which had haunted him in the Luxembourg Gardens, and which haunted him still.

"Ah, you have an extra parcel, I see, and as it is so very wet hadn't we better take the fly? I have the money all ready."

"Of course we shall take the fly," responded Secretan a trifle testily. "And don't you attempt to lift that parcel, Jane. It is much too heavy for you."

The poverty, the makeshifts of their existence, rushing upon him in the moment of his home-coming, filled him with a strange and secret rage. He had had a glimpse of other things. He signed to the porter, and preceded his sister out to the station fly. They found themselves the only occupants; but the noise and rattle of the rickety old vehicle over the uneven half-mile to the village, rendered speech impossible. Jane, however, observed that her brother looked remarkably well, though she admitted to herself that he might be more cheerful.

She attributed it, however, to the dismal conditions of the weather, and anticipated a cosy and interesting chat when they should be comfortably within the Rectory, in a cheerful, well-lighted room.

Midcar Rectory was a long, low, grey house, well overhung with creepers, and very picturesquely set in a pretty, old-world garden with a paddock behind. Beyond that were the purple solitudes of a great stretch of moorland, which Jane loved, though sometimes its bleakness depressed her brother. A meal was ready when they got indoors—not the dainty little dinner to which Secretan had

OPERATIONS AVOIDED

By Lydia E. Pinkham's Vegetable Compound

Belleriver, Que. — "Without Lydia E. Pinkham's Vegetable Compound I would not be alive. For five months I had painful and irregular periods and inflammation of the uterus. I suffered like a martyr and thought often of death. I consulted two doctors who could do nothing for me. I went to a hospital, and the best doctors said I must submit to an operation, because I had a tumor. I went back home much discouraged. One of my cousins advised me to take your Compound, as it had cured her. I did so and soon commenced to feel better, and my appetite came back with the first bottle. Now I feel no pain and am cured. Your remedy is deserving of praise." — Mrs. EMMA CHATEL, Valleyfield, Belleriver, Quebec.

Another Operation Avoided.

Poughkeepsie, N.Y.—I run a sewing machine in a large factory and got all run down. I had to give up work for I could not stand the pains in my back. The doctor said I needed an operation for womb trouble but Lydia E. Pinkham's Vegetable Compound did more for me than the doctors did. I have gained five pounds. I hope that everyone who is suffering from female trouble, nervousness and backache will take the Compound. I owe my thanks to Mrs. Pinkham. She is the working girl's friend for health, and all women who suffer should write to her and take her advice.—MISS TILLIE PLENZIG, 3 Jay St., Poughkeepsie, N.Y.

Thirty years of unparalleled success confirms the power of Lydia E. Pinkham's Vegetable Compound to cure female diseases.

HE WANTS THEM ALL TO KNOW

ABOUT GIN PILLS

They Cured Him and He Knows They will Cure Others

DAVISVILLE, ONT.

"I want to let you know what GIN PILLS have done for me. I had trouble with my Kidneys and Bladder so I got a sample of GIN PILLS and followed directions. I felt better after the first dose and I kept taking them for a month.

One day, Mr. Simpson of this town, told me about the trouble he had with his kidneys and I recommended him to try GIN PILLS, and gave him one to take. The next day he bought some for himself and both he and his wife have received great benefit from them. I have also induced many others to try them.

I am trying to get my sister-in-law to try them. I wish you would send me a sample box to give her."

HERBERT H. BAUER.

If you have a friend who is suffering from Kidney or Bladder Trouble or Rheumatism, send name and address, and we will gladly mail a free sample box of GIN PILLS. At dealers, 50c. a box, 6 for $2.50, or sent on receipt of price. Remember — GIN PILLS are guaranteed to give relief or money refunded. National Drug and Chemical Co. Dept. M. F. Toronto.

National Lazy Liver Pills regulate liver and bowels, and cure Constipation. 25c. a box.

very readily accustomed himself at the Restaurant Amedee, but the substantial high tea which obtains in so many parts of Yorkshire.

"It is quite like old times to have you back, dear," she said, nodding kindly at him from behind the homely tea cosy of her own making. "I shall want to hear a great deal presently. Your letters have not been very copious."

"I am no letter-writer, and the time seemed to fly," replied Secretan as he essayed to carve some slices from the cold ham which stood invitingly in front of him. "How have things gone, and how did Bakewell do?"

"Fairly well, only very fairly, dear," she answered guardedly. "I am afraid he is rather a worldly minded youth, and Midcar bored him. The only time I saw him really wake up was when he was asked to dine at High Ridges."

"So they did ask him there," said Secretan dryly. "Did he go?"

"Oh, yes, and ever after he talked of nothing but Audrey."

"Silly ass!" said Secretan, with some unnecessary asperity.

"Everyone will be pleased that you are back," she said with an affectionate glance. "There have been two deaths in the parish this week."

"Whose?" he asked quickly, arrested for the moment from his more selfish thoughts.

"Little Annie Bartlett and Tom Courtney's wife at the Court Farm."

"Mrs. Courtney!" exclaimed Secretan pushing his chair back. "Why, what happened? She was as well as you or I the last Sunday I was in church."

"She died quite suddenly. It seems her heart was weak. I was up to the Farm yesterday, and Tom blames himself very much. He told me he had had a fit of his old temper, and that it was immediately after it his wife died. I felt sorry of the man. The Court temper is a frightful curse, and he is besides a helpless creature. Poor Emmy had a handful with him! He is thankful you have come home in time for the funeral—she is to be buried at Clydbridge on Monday."

"Well, and what else?"

"Nothing much, except that the Coynes have lost a whole litter of pigs," she answered, and a humorous smile played for a moment about her mouth, wonderfully lightening its gravity. "Aaron says poison, and Anne says the will of God, but it has made a lot of talk in the place."

There was no answering smile on Secretan's face, and after a moment's silence his sister leaned across the table a little anxiously.

"You see out of sorts, Claude. Don't you feel quite well, or is it that you don't have what you like? There is a whole basket of new-laid eggs from the Court. Mr. Courtney sent them down only this morning. Shall I tell Hannah to poach a couple for you?"

"No, dear, thank you," said he, rousing himself with an effort. "This is very nice. I'm afraid Paris is not quite what we thought it, after all—in the way of a fillip, I mean."

"Didn't you enjoy yourself, then?"

"Every minute of the time, the last week most of all."

"I suppose because you began to feel yourself quite at home," she said, cheerfully comprehensive. "The strangeness here will wear off in a day or two."

She rose and began to clear the table, while her brother retired to the study to unpack the parcel of new books. When he looked round the wide bare room, with its shabby carpet and bookshelves sparsely furnished, a strange fury of disgust seized him, which even the suggestive

The Best Way To Conserve The Natural Resources Of Your Farm

YOUR land is your biggest asset. On its power to grow good crops depends your very livelihood. What are you doing to insure its continued fertility—your future prosperity?

There is a great national movement on foot now for "The Conservation of Our Natural Resources." Don't think this applies only to our forests and coal mines. The soil, too, has been drained of its natural wealth by season after season of bumper crops. For your own good, join the soil conservation movement now. Begin on your own farm. There is a practical, economical, profitable way. Invest in an

I H C Manure Spreader

as hundreds of other farmers have done. By distributing your manure with one of these efficient machines you can keep your land always in top-notch condition. Barnyard manure is rich in the elements that enrich the soil, and an I H C Manure Spreader enables you to distribute it in the way to use all of it to the best advantage. I H C Spreaders are so designed that the manure can be spread in just the right amount required by the condition of the soil—a heavy coat where it is most needed—a light top dressing where that is best. They are simple and strong in every part. Their dependability has been proved by years of service.

I H C Spreaders are made in two styles:

Corn King Cloverleaf

in sizes suitable for any size farm.

Call on the I H C local dealer and see the one best adapted to your needs. Ask him about the bigger profits I H C Spreaders are bringing to users. If you prefer, write direct, or to nearest branch house for I H C Spreader catalogue and full information.

Why Every Breeder Should Have a Typewriter.

After working hard all day in the stable, the field and in the woods, the average breeder goes home at night to find mail waiting him that demands prompt attention. Your hands are naturally calloused and you would rather handle a pitchfork than a pen. If you had a Typewriter you would find it much easier to manipulate. The key board, showing letters plainly, is very simple. It may take a little longer at first to write your letters, but you can "speed up" with little practice. Then again, a Typewriter is better in a home where there are growing children, especially girls, than a piano. If they learn to operate it will not take nearly so long for them to get through business college if they know the use of a Typewriter. Right here is where you will probably save the cost of a machine. They last a lifetime with care and the fact that your correspondence is written on a Typewriter will give you a standing with prospective buyers that cannot be obtained in any other way. We have lots of new machines ready to ship and have several second hand ones that have been rebuilt. If you are interested write for further information with regard to cost, etc, mentioning The Maritime Farmer.

picture of "The Man with the Muckrake" above the mantelpiece failed to rebuke.

"I am a fool, and an ungrateful fool at that!" he said to himself with a sort of savageness. "I must get out of this outlandish hole, where a litter of pigs is of more importance than the cure of souls. The cure of souls, that's my business in life, and I'm badly in want of a cure myself!"

He began to whistle, to keep down the rebellious thoughts; and Jane, across the passage, heard the cheerful sound and was comforted by it.

Not unaccustomed to her brother's vagaries of temper, she felt disappointed that his holiday had not been productive of a better harvest. But, being a sensible woman, she hoped for better things.

They came a little later, when they had a pleasant hour together over the log fire in the study, and Claude became chatty and reminiscent over his holiday. But he did not mention the name of Helen Revell.

Next day the Rector was early abroad in the parish, addressing himself manfully to the waiting duty, and was warmly welcomed. He was greatly liked in Midcar, his warm, sympathetic nature winning him many friends. The tall, lean figure on the well-worn bicycle was a familiar and always welcome sight about the lanes and the open moorland road. He paid a visit to Court Farm—"The Court," as it was called in Midcar—an old-fashioned Elizabethan farm house standing high on the edge of the moor, its fertile lands dipping to the west on the farther side. He settled down manfully indeed to the old routine, and seemed happy enough, but Jane would have been surprised could she have had a glimpse into the innermost recesses of his heart. She had ever, somehow, pictured him as a lover, though the thought that he might marry one day had sometimes intruded itself. But he had always seemed cold to women, and had often proclaimed his belief in the elibacy of the clergy. Jane did not elieve in celibacy at all, though she had refused more than one good offer. She was not afraid to say matrimony was the canonical state, else why "male and female created He them?"

Jane gradually came to the conlusion that the Paris visit had not been a success. She did not talk about it, however, being one of the few women who believe that speech complicates life. She had a very still nature, and could wait with an astonishing patience for the development of events.

An unexpected development of the Paris visit occurred about six weeks after Secretan's return. When he came down to breakfast one morning he found among his letters a large square envelope addressed in a handwriting he did not know. It had a small neat black crest on the flap, and bore the Colchester postmark. Happening to glance at him at the moment when he lifted it, Jane was surprised to see his face flush. He put the letter in his pocket at once, and said nothing at all about it. He began to talk about some quite trivial, inconsequent matter, and rose from the table more quickly than his wont.

About an hour later, when Jane still puzzled, and perhaps a trifle apprehensive, since up till now there had been a perfect confidence between them, was busy with her kitchen duties, she heard him calling her.

(Continued next issue.)

MAXWELL'S HIGH SPEED CHAMPION

is unsurpassed in every way. In design, appearance and working parts, this Washing Machine has no equal at any price.

MAXWELL'S "CHAMPION" has the largest opening of any washer. Practically the whole top opens up—gives you plenty of room for working.

The tub is Red Cypress—the wood that grows in the water — that won't shrink or rot — that lasts a lifetime.

The "Champion" is the only washer that may be worked with side crank as well as with top lever.—Perfect construction, high speed, balance wheel make Maxwell's "Champion" the easiest running washer in the world.

Don't put up with a wash-tub when it is so quick and easy to do the family washing with Maxwell's "Champion".

This Fence Has Vast Strength

For a fourth less than the price we pay, we could get hard-drawn steel wire. But that kind, though used in most other wire fence, hasn't the *life*, the springiness, the strength we insist on for Maritime Wire Fence.

• • • •

So we make this fence of extra-heavy hard drawn steel wire of nine-gauge. Constantly we test it for quality. And so we *know* this fence has *more* strength than it probably will ever need.

• • • •

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime Fence is far longer—and the fence surely reliable.

• • • •

On this extra-quality wire we put a smooth, even heavy coat of galvanizing. We put on more than enough — that's our way. You gain by the longer life of this better fence. And we lock laterals and upright wire rigidly, yet springily, with a cross-leverage lock that simply CANNOT let go under the hardest strain.

• • • •

You can bank on the strength of this fence Make the test for yourself and your neighbors. Then get the agency—it will pay you well. Address

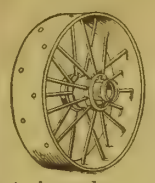
The Worth of a Wagon Lies in Its Tires.



Wheel and tire troubles are over for the man who equips his farm wagons with T-K Wide-Tire Steel Wheels. They will carry 25 to 50 per cent. heavier loads in deep mud or over the rockiest roads without delay or danger of accidents. They make farm work lighter: stand any strain; and are proof against breakage.

TK Wide Tire Steel Wheels and Handy Farm Wagons

This is the sort of wagon you want for doing all kinds of work around the farm. It is handy for loading and unloading, will carry as great a load as any team can haul, and because it never needs repairs it is the most economical wagon on the market.

Dish Washing.

This seems one of the simplest of tasks, yet there is a right and wrong way of doing this as well as any other branch of hodsework. I know of one woman who makes dish washing the standard by which she judges her kitchen maid, and if she does this work properly, she retains her, no matter in what else she may be found wanting. The first thing is to soak all cooking utensils and egg and dough dishes in cold water, as the heat would cook the flour and egg if it came in contact with it, then carefully scrape all dishes and rinse oily and specially soiled ones. Pile all dishes of one kind together; empty each cup aad glass and rinse all milky utensils in cold water. After everything is cleared up and all food put away, fill the pan with clean, hot, soapy water and begin.

Many people prefer to wash all the cooking utensils first and it certainly makes the task seem easier; it also leaves the washers hands in better condition than if the pots and .pans were left till the last, but if you choose this way be sure to empty and wash the dishpan well before starting on the glass. Wash the glass, rinse in warm water and wipe at once; then wash silver and rinse it in very hot water, rubbing hard to preserve the polish. Put it away at once, so it will not become spattered from the other dishes; then wash the cleanest dishes and rinse in water well below the boiling point as too high a temperature cracks the glaze, and in time ruins the china. Fine dishes should never be left to soak in the water while something else is being done, for it injures the patterns.

Don't leave soap in the water; don't put the handles of pearl-handled knives in the water and don't use anything but the cleanest water and towels all the time. Don't pile dishes of every shape in the pan at once and then wonder how so many get nicked and broken. Another frequent cause of breakage is in sudden changes of temperature in dish and rinsing water; neither very hot nor very cold water is as likely to crack china as extremes of heat and cold in succession. It is better to use a mild soap rather than a strong one on fine dishes, and never rub any kind of scouring soap directly on patterned ware.

Sleep and Fresh Air.

Many objections are raised against sleeping with bedroom windows open at night. The most common of these are made with reference to the night air, draughts, cold and dampness. It is a scientific truth that air is much purer at night than it is in the daytime, because at night it contains a smaller percentage of fire combustion than it does during the day. This, of course, is particularly the case in cities. Draughts can be avoided by the use of screens or by so placing the bed that the draught does nbt reach it. A person need not be cold with plenty of warm bed clothes. To-day it is a common thing for people to sleep out of doors the year round in all kinds of weather. The moisture in the night air is of no great consequence when we consider that most of the moisture on the window pane of a living room is due to the exhalation of the lungs of those present in the room and that an adult's lungs give off over half a pint of moisture within nine or ten hours.

"Look before you leap"

If you are going to paint this spring, you want to do it as economically as possible. Your first idea may be that you will buy *cheap* paint and thus save money. True economy in painting, however, is not what the paint costs per gallon, but what a gallon will cover and how long it will last. Figure it yourself—cheap paint does not cover well, it does not wear; in a year or so you have to repaint. The labor of applying the paint is two-thirds of the cost of your job. You can't afford this labor expense every year. Buy a good paint, it will cover more surface, look better and last longer than cheap prepared paint or hand-mixed lead and oil. Ask the S-W dealer in your town and he will tell you all about SWP.

The Little Paint Man.

SHERWIN-WILLIAMS PAINTS & VARNISHES

Sherwin-Williams Paint, Prepared (SWP) is made from pure white lead, pure zinc, pure linseed oil, and the necessary coloring pigments and driers.

Sherwin-Williams Varnishes are made from the best gums, pure linseed oil, pure turpentine, and are thoroughly filtered and aged. They spread and wear well.

Summers, Box H 309, Windsor, Ont.

Never hesitate about giving Chamberlain's Cough Remedy to children. It contains no opium or other narcotics and can be given with implicit confidence. As a quick cure for coughs and colds to which children are susceptible, it is unsurpassed. Sold by all dealers.

Cheerfulness.

A dear old lady, now in the Summerland, used often to remark with a quiet smile, "There is just as much difference in folks as there is in anybody!" We must all admit that there is a difference in the people one meets, a more or less marked difference between any two persons of one's acquaintance.

Thus in one's circle of friends may be found the cheerful person, the less cheerful, the least cheerful and, alas! occasionally the cheerless. How pleasant it is to meet the steadfastly cheerful people!

They who find life a joyful thing
Of boundless scope and power,
Into our presence sunshine bring
However dark the hour.

In striking contrast with these light-diffusing companions are those unfortunate persons who habitually look on the dark side of things.

Alas, that cheerless face and tones
Of doleful discontent
Should name life's jewels common stones
For no rich setting meant!

Do we not owe to ourselves and to our friends and associates, the duty of cheerfulness?

And in striving to overcome all inclinations to look on the dark side, in gaining that self-control that can maintain the cheerful spirit under trying circumstances, do we not qualify ourselves the better to fulfill our mission in life, whether it be world-wide or limited to a farm home and quiet rural neighborhood?

Certain papers have much to say about the discontent of farmers' wives, the gloom and melancholy of their dull, monotonous lives. A certain daily paper, read by women throughout our land, has recently published a series of so-called "lay editorials" picturing "country life" in words that must raise an indignant protest from the many happy wives on the farms of New England.

A woman who can see nothing attractive, nothing worth while, nothing compensating in the life of the farm must view the relative value of things from the standpoint of the cheerless pessimistic observer.

And we doubt if she is the cheerful radiator of heart-sunshine in whatever sphere of life she may be placed.

It is true that there is work to be done in the farm houses, and that there are many women who overwork there; but are there not many also who overwork in city homes?

We believe the majority of New England farmers' wives see lines of beauty in their daily tasks, love their country homes and realize the cheerful fact that they are among the most fortunate of women.

It matters far less where a woman's home is than what "mist" she is!

If she be an optimist, she can enjoy her home and live an earnest, helpful, cheerful life in country or city, east or west, rich or poor.

But if she be a pessimist, she will see only trials, unpleasant possibilities and unsatisfactory conditions wherever she may dwell.

Sisters, it depends on us! The most important question is not, "Where do I live?" It is, "Which 'mist' am I?"

Facts About House Flies.

House flies are now recognized as most serious carriers of such germs of certain diseases such as typhoid fever, tuberculosis, infantile diarrhoea, etc. They infect themselves in fifth and decaying substances and by carrying the germs on their legs and bodies they pollute food, especially milk, with the germs of these and

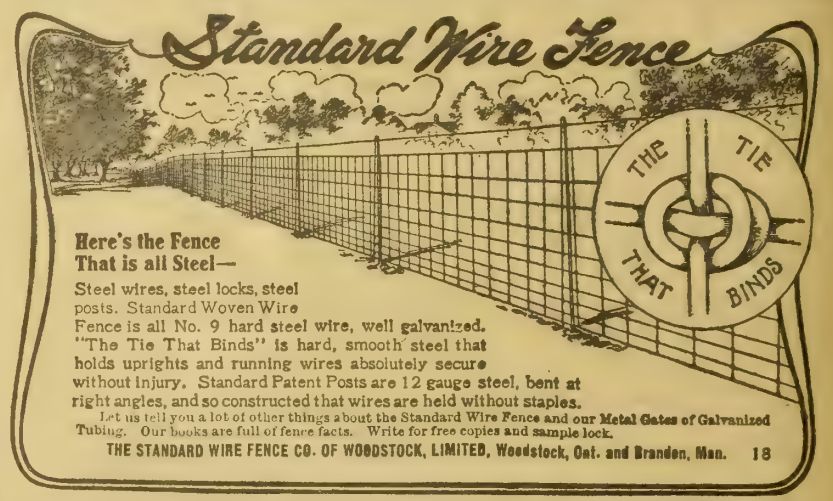
Standard Wire Fence



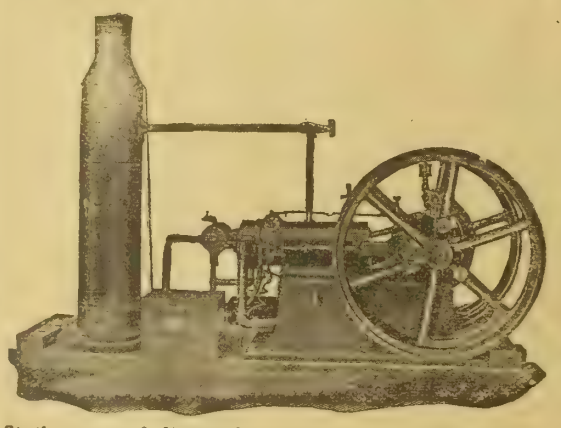
Here's the Fence That is all Steel—

Steel wires, steel locks, steel posts. Standard Woven Wire Fence is all No. 9 hard steel wire, well galvanized. "The Tie That Binds" is hard, smooth steel that holds uprights and running wires absolutely secure without injury. Standard Patent Posts are 12 gauge steel, bent at right angles, and so constructed that wires are held without staples.

Let us tell you a lot of other things about the Standard Wire Fence and our Metal Gates of Galvanized Tubing. Our books are full of fence facts. Write for free copies and sample lock.

THE STANDARD WIRE FENCE CO. OF WOODSTOCK, LIMITED, Woodstock, Ont. and Brandon, Man. 18

Farmers of Quality



Stationary and Mounted, in 1 1-2 to 30 Horse Power

Want Quality!

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of sealing directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

A BAD COLD

Developed Into

BRONCHITIS.

Neglected Bronchitis is very often the direct cause of Consumption, and on the first symptom appearing Dr. Wood's Norway Pine Syrup should be used and the Bronchitis cured.

The symptoms are, tightness across the chest, sharp pains and a difficulty in breathing, a secretion of thick phlegm, at first white, and later of a greenish or yellowish color, coming from the bronchial tubes when coughing, especially the first thing in the morning.

Mrs. Dan. J. McCormack, Cleveland, N.S., writes: "My little boy two years old caught a bad cold which developed into Bronchitis. He was so choked up he could hardly breathe. Reading about your wonderful medicine, Dr. Wood's Norway Pine Syrup, I decided to try a bottle and with such good result I got another which completely cured him, without having a doctor. I cannot say too much in its praise; I would not be without it in the house as I consider it a sure cure for Colds and Bronchitis."

The price of "Dr. Wood's" Norway Pine Syrup is 25c. It is put up in a yellow wrapper. Three pine trees is the trade mark. Be sure and accept no substitute for Dr. Wood's.

Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

FARM BARNS
Must Be Fireproof

Brick and stone are out of the question for building farm barns. The first cost is too high—and the expense of freight and hauling prohibitive.

"IDEAL" FACE DOWN CONCRETE BLOCK MACHINES

give you fireproof building material at most reasonable cost.

With an "Ideal" machine, you can make the concrete blocks right on the spot—make them yourself—so that the only cost is for actual material and putting them in place.

A barn, built of "Ideal" Concrete Blocks, is a barn to be proud of—solid, substantial, absolutely fireproof, warm in winter, and built for all time.

Even if you are building only one barn, silo or house, an "Ideal" Machine will pay for itself—and you can make concrete blocks for your neighbors and net a tidy profit all the year round.

Write us for handsomely illustrated catalogues. 9

Maritime Poultry Supply Co.,
Moncton, N. B.

oth?r diseases and of decay. No fly is free from germs. The best method is to prevent their breeding.

House flies breed in decaying or decomposing vegetable and animal matter and excrement. They breed chiefly in stable refuse. In cities this should be stored in dark, fly-proof chambers or receptacles, and it should be regularly removed within six days in the summer. Barnyard manure should be regularly removed within the same time and either spread on the fields or stored at a distance of not less than a quarter of a mile, the further the better, from a house or dwelling.

House flies breed in such decaying and fermenting matter as kitchen refuse and garbage. Garbage receptacles should be kept tightly covered. All such refuse should be burnt or buried within a few days, but at once if possible. If it cannot be disposed of at once it should be sprinkled with chloride of lime.

FLIES IN HOUSES.

Windows and doors should be pro perly screened, especially those of the dining room and kitchen. Milk and other food should be screened in the summer by covering it with muslin; fruit should be covered also. Where they are used, especially in public places as hotels, etc., spittoons should be kept clean, as there is very great danger of flies carrying the germs of consumption from unclean spittoons. Flies should not be allowed to have access to the sick room, especially in the case of infectious disease.

The faces of babies should be carefully screened with muslin.

Flies may be killed by means of a weak solution of formalin or fornaldehyde exposed in saucers in the ooms. This is made by adding a tablespoonful of formaldehyde to a int of water. The burning of pyrehrum in a room is also effective.

House flies indicate the presence of filth in the neighborhood or insanitary conditions.—Entomological Division, C. E. F., Ottawa.

Appetite.

How sweet it is to take your seat, and loosen up your belt and eat! when hungry, at a groaning board, The man thus gifted can afford to grin at all life's little ills, at fortune's frowns, however grim, at druggists and at doctors' bills—this world is just a snap to him. Dyspeptic people, driven daft, by foolish fads, look on and say: "He ought to try the Fletcher graft, and chew his food for half a day. To swallow smoking food like that, is nothing better than a sin; yet he seems strong and beastly fat, and we are bilious, weak and thin!" Another crank looks on aghast, and cries: "Great ginger! What a shame. That man should try a three weeks' fast if he would strengthen up his frame! To eat so fiercely violates the rules that modern science springs; yet he seems well, while fasting skates are slowly drying up, by jings!" And other faddists wag and jaw and keep the air with protests warm; h ought to eat his victuals raw, or take them down in capsule form. He loves to hear the dinner horn invite him to increase his weight; he laughs the idle fads to scorn, and eats as Father Adam ate.

A Good Wall Finish.

A cheap, yet artistic wall finish is the Venetian red, dear to all who like pictures brought out; for a good-sized room, take a quarter of a pound of good glue and ten cents worth of Venetian red in powder. Dissolve the glue in a water-bath to the consistency of milk, first by soaking over-night in cold water to soften, then dissolving to liquid form by heating in the water-bath, then add two gallons of warm water stir in the powder slowly until thoroughly mixed, then apply to the wall with a large brush, keeping the paint stirred up from the bottom. It will not rub off, and may be applied to any surface.

Stove Burnt Red.

For the top of a stove burnt red, try greasing the red surface with lard when the stove is cold; let stand for a few hours, then apply a thin coat of blacking, let get nearly dry, then polish with a brush.

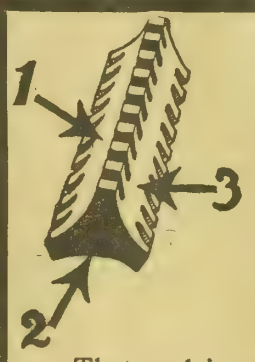
MANUFACTURERS.

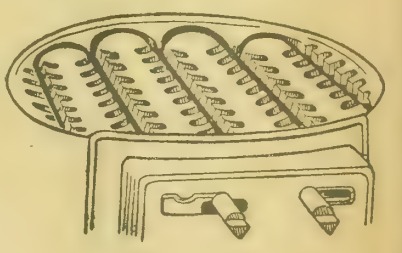


Each grate bar has three sides—long wear

When only *one* side of a grate bar is continually next to the fire all the wear is *concentrated* on that one side. The life of the grate bar is thus naturally just *one-third* as long as when the wear is *distributed* on *three* sides.

That explains why Sunshine grates have *three lives*. Each of the four grate bars has *three* sides. Each time the ashes are "rocked down" (no shaking with Sunshine) the side next to the fire can be changed. Thus the life of the grates is greatly prolonged.

When desired, the heavy bull dog teeth on the grates will seize hold of clinkers, grind them up, and drop the particles into the ash-pan.



Buy the Sunshine—the durable, convenient, economical furnace, *guaranteed* by largest furnace makers in British Empire. 52

Was So Bad With Heart and Nerves Could Not Sleep At Night.

Many men and women toss night after night upon a sleepless bed. Some constitutional disturbance, worry or disease has so debilitated and irritated the heart and nervous system that they cannot enjoy the refreshing sleep which comes to those whose heart and nerves are right.

Mrs. John Gray, Lime Lake, Ont., writes:—"Last summer I was so bad with my heart and nerves that I couldn't sleep at night. There was such a pain and heavy feeling in my chest that I could not stoop, and at at times I would become dizzy and have to grasp something to keep from falling. I tried different things but never got anything to do me any good until I tried Milburn's Heart and Nerve Pills and I can now recommend them to all troubled as I was."

Milburn's Heart & Nerve Pills are 50 cents per box, or three boxes for $1.25, at all dealers, or mailed direct by The T. Milburn Co., Limited, Toronto, Ont.

FLORICULTURE

N. B., writes:—My fine Rhododenron that bloomed profusely for several years is apparently entirely dead this spring. There does not seem to be anything wrong with the bark or buds to indicate the cause of such a sudden demise. We placed some spruce boughs around it last fall for protection in place of straw which we have always used. Would this brush affect it wrongly or cause its death?

Last winter was exceptionally hard on many plants and shrubs. The spruce would not have any injurious effect and would be, in my opinion, preferable to straw as a covering. Many varieties of plants and shrubs that have always proved thoroughly hardy succumbed last winter and the old rule of plenty of snow, no winter kill developed the aclimatic exception.

The cut worms will soon arrive and will improve each shining hour. Look out for them. When you see a plant apparently broken off close to the ground dig around it, about an inch deep, and within the radius of about two inches, and you will probably find a short fat gray worm or grub about an inch long. Kill him promptly, for he is a thief and a destroyer and deserves no mercy. One cut worm will destroy a dozen healthy plants in a night eating only a very small section of the stalk close to the ground. There is no remedy so sure as to hunt for them every morning and destroy all found.

As soon as the Sweet Peas come up and have some support, top dress with ashes which should be hoed into the soil some inches from the vines.

Don't let the weeds get ahead of you in the beds.

Don't neglect to water the newly set out plants. One pint of water is more good now than a gallon three weeks from now.

Don't be too indolent to have a small flower bed if you have ground and don't plant more stuff than you can easily care for.

Hampton:—What shall I do with my hardy Roses if all covered with small lice that cause the leaves to look gray in color as they did last spring; Hellebore had no effect on them. What can I do for them?

Spray Roses with the following—1 gallon Kerosene Oil; ¼ lb. good hard soap dissolved in boiling soft water.

Work this into a butter with a syringe or old egg beater, then spray the under side of the leaves with this diluted by ten times its bulk of water. Be sure and keep the mixture well stirred. One application a fortnight should be enough.

To Clean Matting.

Matting is usually cleaned by washing lightly with salted water, using a flannel cloth. It should be wet as little as possible, and wiped dry with a soft, dry cloth. Any badly soiled spots should be first rubbed with dampened corn meal, after a gentle but thorough sweeping to remove all dust. A quart of salt to a pailful of water is about the proportions. The water should be cold, and the matting wet as little as may be.

If matting is sewed with strong, soft thread, making long stitching instead of tacking over-laps, there will be no ridges to scuff out with the feet as there always are, if the breadths are lapped and fastened with tacks. A poor quality of matting is an extravagance, and one piece of good quality will outlast two or three poor pieces.

Feel Young for Ever.

Let Me Put Vitality Into Your Blood, Nerves and Body. Follow Me to Health and Manhood. I Can Show You What Others Have Done to Change Debility, Weakness and Despondency Into Health, Strength, Vigor.

Vitality is the measure of the man in this day of big deeds and monster achievement. He who has great vital strength cannot grow old. Years count for nothing if you have the vitality in your blood and nerves. My Health Belt with suspensory attachment is the FOUNTAIN OF PERPETUAL YOUTH; It pours quantities of electro-vital force into your weakened system. It works quietly, mildly, continually hour after hour while you are sleeping. It is your opportunity as it has been the opportunity of tens of thousands before you; it supplies you with that vitality upon which health and courage depend. It is a power and strength giver of the highest order. No drugs, nothing to take internally, no dieting, no hardships of any kind. Simply use the Health Belt nights until you are restored to vigor. It never ceases until you have as much courage and self-reliance as the biggest, fullest blooded man you know. Your eyes will have the sparkle of full health, you will have the vigor of a strong, healthy man. Henry Eggman, Norwich, Ont., writes: "Thanks to the use of your Health Belt I am young again. It restored me after all else failed. Use my testimonial as you see fit." This is but one of thousands. Get the free books and read of others.

Special rheumatism attachments to my Health Belt carry the Electro Vitality to any part of the body, neck, back, arms, legs, feet. It finds and drives away all pains and aches; it has often completely cured a weak back in one night so that it never returned again. It is a wonder remedy for chronic ailments of the nerves, blood and muscles.

FREE UNTIL CURED.

Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment. Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

Crop Bound Hens.

In cases where birds are found to be crop bound the course of treatment given by many successful poultrymen is as follows: Hold bird's head upwards and pour in sufficient water to cause vomiting, meanwhile gently massaging crop. If this is ineffectual an operation should be performed. No careful person need fear this, as it is extremely simple and is always effectual. Place fowl on its back and make incision in crop with sharp knife; incision to be about an inch long and all larger blood vessels should be avoided. Remove contents of crop with handle of a teaspoon then wash out with warm water, containing one per cent. solution of carbolic acid. Edges of the wound should be dressed with salad oil and a little, 3 or 4 drops, should also be placed in crop. Each skin must be sewn up separately with fine needle and silk; make each stitch separate by tying twice and cut off silk. Keep bird warm for several days. Keep bird warm for several food. Give no water for three days.

A Hot Shot.

A Wisconsin farmer, one of those who is forever opposong all new ideas, was scolding away in a group of other farmers, about these bothersome new ideas.

"Well," said one of the group, "these things hadn't ought to bother you any, Tom. You have run your farm according to your own ideas, and I don't know of any one that gets less from his cows than you do. If your notions are so much better than any others they ought to show it in your dividends from the creamery."

That was a hot shot and Tom wilted, but after all he was not a sinner above a host of other farmers who boast of being "practical" and prove it by keeping cows that earn less than their more intelligent neighbors.

What's the matter with those farmers? Why simply this, that they lack dairy intelligence, and so they talk against what they lack most. That is a common trait in human nature, but we never yet saw a man making any money by it.—Hoard's.

How Wart Disease in Potatoes is Spread

According to a report issued by the Harper Adams Agricultural College, this unsightly disease is spread in various ways, and, although it is not able to extend rapidly except by the zoospores produced in May and June, it is distributed by means of manure, infected seed, and animals.

The Use of Manure from animals, especially pigs, fed on raw warty tubers is a common means of distribution in cottage gardens.

Infected Seed is frequently the means by which the disease is introduced into a previously uninfected area.

The early purchase of seed and regular examination of suspected lots would lead to the detection of the parasite, as it generally extends on potatoes stored in pits, even if they were attacked at the same time of lifting to an unnoticeable extent.

Animals are also active agents in spreading the parasite. Cases are known in which it has been carried to clean ground by trespassing poultry and pigs, by workmen, who have used spades and other tools in infected soil, and then taken them for the purpose of planting potatoes on clean ground.

In the above connection a review of examples demonstrating the above means of spreading the disease may be of interest.

1. Manure from pigs fed on raw diseased tubers was applied to a portion of a garden that was quite free from the parasite, and when the crop was lifted it was found to be badly attacked.

2. Diseased plants were observed in 1908 in a field of potatoes adjoining cottages where the gardens were full of the disease. The pigs and poultry belonging to the cottagers had trespassed on this field in the previous autumn, and as they had been fed on raw diseased potatoes, it may be fairly assumed that infection of the field was brought about by spores of the disease in the dung of the animals.

3. An outbreak in a garden about twelve years ago spread rapidly and in consequence the ground was wired in and turned into a poultry run. The fowls had previously been allowed full liberty, and had carried portions of diseased tubers or infected soil into adjoining gardens, where the fungus was soon noticed, and at the present time all these gardens are uniformly infected. It is interesting to note that cottage gardens on the opposite side of the road and liable to be trespassed on by poultry are still free from wart disease. This is probably due to the spores of the parasite being removed from the claws of the birds in making their way through hedges and grass.

4. An instance of infection by throwing the water, in which pig potatoes from an infected garden were washed, on a piece of clean land. This ground was covered with shrubs of large size which the tenant was allowed to clear off in order to obtain a piece of uninfected land for potatoes. It was planted with up-to-dates, and when lifted the crop was very full of warts. This was rather puzzling at first as the bushes had been planted fully twenty years, but inquiries elicited the information that it was the custom to throw among the bushes the washings from the pig potatoes grown on the infected part of the garden.

5. A striking example of infection by means of seed. A consignment of seed potatoes from a county where wart disease is very prevalent was distributed among a number of the growers in the spring of 1908. One of the purchasers planted the potatoes on newly reclaimed land, and in August reported the existence of the disease in the field.

When the crop was examined diseased plants were found scattered all over the field, being most numerous in the damper portions.

Here's Your Paint!

Whatever your job of painting—whether you do it yourself, or have a painter do it—be sure of a GOOD job, soonest done, best looking, longest service, by getting

M-L PURE PAINTS

MAPLE LEAF

All ready for use. Simply choose the right color from the forty-seven shades in which M-L paints are made—take off the cover, stir a bit and start to work. You'll find M-L Pure Paints spread easier, cover more surface, give a smoother, glossier finish than any other paint you could buy.

Use M-L Paint and You Won't Have to Paint so Often

Other paints soon fade, blister and flake off because other makers haven't yet found out, as we have, how to mix a special ingredient with other pure materials to make an elastic, durable paint that stands extremes of wear and weather, and keeps its lustre for the longest time.

Decorate the walls and ceiling with M-L FLAT WALL COLORS. More economical, more artistic, more sanitary than wallpaper. Easily applied and very durable. Washable, too. 16 shades. Try them.

Made in 47 colors for every painting purpose by Imperial Varnish & Color Co., Limited, Toronto

Warbles or Grubs.

As usual, at this season of the year, many inquiries are being received about the "warbles" or "grubs," which infest the backs of cattle.

Two kinds of bot flies occur in America, the larval forms of which infest cattle. The mature flies appear in warm weather—May to September—and lay their eggs on the cattle. It is now generally accepted that these flies do not puncture the skin of the back when they lay their eggs, nor do the young grubs which hatch from these eggs penetrate the skin of the back. The eggs are laid on the cattle and the small grubs hatch out there, when the cattle, in licking themselves, take the grubs into their mouths. These grubs are found infesting the gullet or esophagus, and sometimes in other parts of the body, and by January make their appearance under the skin of the back by migrating through the tissues of the cow.

Shortly after the appearance of the grubs in the back a small opening appears in the skin, communicating with the cavity occupied by the grubs.

When in large numbers they must produce considerable irritation and do injury to the animal; but probably their greatest damage is in the injury done to the hides of the cattle slaughtered. If nothing is done, the holes in the skin increase in size and the grubs finally come out and fall to the ground. They usually leave the cattle from February to April or May and falling to the ground, burrow and take on what is known as the pupa stage and emerge after a month or so, as mature flies, ready to lay eggs again, and continue the life cycle.

We subsmitted the above to our veterinarian who replied as follows:

With all due deference to the scientist whose theory regarding warble grub development has been quoted of late years as standard in the agriculture and live stock press the common belief of stockmen is that the fly (hypoderma lineata) lays her eggs either in or upon the skin and that grubs then develop in the places where the eggs were deposited. The idea that the eggs are swallowed by the animal and that the embryo larvae work their way through the walls of the esophagus (gullet) and after burrowing and slow progression at length arrive under the skin seems preposterous to most minds.

The pertinent question arises: Why do the grubs always form upon the back, along the spine, just where the cow can neither lick or switch away the fly? If the new theory be correct should grubs be found anywhere and possibly everywhere in the body? We do not say that the new theory is wrong, but it is at least incredible to most practical people and will have to be much better proved than at present before it is generally accepted as the truth.—Hoard's Dairyman.

The Influence of a Father.

We take the following extract from the address of W. H. Olin before the Colorado Dairymen's Association. It tells its own story:

"Yes, but is it not a fact that too many dairy cows turn the boys from the farm? Not if they have an interest in it. There was in the state of Iowa a farmer who wanted to multiply the number of cows that he had by two, but at the same time he wanted good milkers, and he knew that his three sons were good milkers and if he hired persons to milk the cows they might milk them well and they might not. He decided that he would try the experiment with John and Henry and Joe. So he told them that he realized it was going to make extra work for them, but that they would just simply go into a partnership, and they might have a certain percentage in the business, but there were a few things he would like to say, he would like to see that the cows were well fed and properly cared for, and that the boys work together. Every one of those boys began studying the cow, they got the bulletins that were issued by this station and that station and studied the tendencies and the requirements of the cow.

It was just as John Cannon, probably the greatest hog raiser in the state of Iowa, said in reference to hog raising; the first thing was the study of the hog, the second to find out what he likes, study his likes and dislikes, his general tendency and temperament; and the third thing was to get right down with him and live with him and in that way make a success of it. These boys took their father's offer, and the result was that instead of those boys being driven away from the farm, every one became a successful dairyman, and that farm became the best kept farm in the entire neighborhood, and the father was thoroughly satisfied with his experiment. have wondered if it might not be worthy thing if every farmer would consider taking the boys into held to the farm. These are facts that partnership in that way; the result I believe are well worth our consid- might be that the boys would be eration."

Amatite ROOFING

Why the Buyer of Amatite Never Complains

When a man buys ordinary ready roofing he usually neglects to paint it and after three or four years he comes back to the dealer with a protest. It is human nature to neglect painting roofs.

When a man buys Amatite Roofing he lays it on his building and in three or four years it is still as good as new and does not need any paint. He forgets he has such a roof but no harm is done by that.

There is nothing to neglect in the case of Amatite. Amatite has a peculiar surface—a sort of plastic concrete made of pitch and mineral matter.

This surface is plastic enough so that the material can be rolled up into handy rolls in the usual manner and handled just like any other ready roofing. When unrolled on the roof and nailed down it presents to the weather a continuous surface of mineral matter and pitch. On this surface wind, rain, storm, heat and cold have little effect. Year after year it looks up to the sky undisturbed and unaffected. It costs nothing to maintain and relieves the owner from all responsibility.

Dealers can improve their business by selling Amatite and buyers make a good bargain when they buy it. The price of Amatite is less than that of most painted roofings of less weight and durability.

Sample free on request.

Gourlay Pianos

ARE NOT MERELY FIRST-CLASS, THEY ARE SOMETHING BETTER.

Good pianos that are regarded as first-class and to-day are as fine as they ever were, are not only out-classed but appear at a disadvantage when compared with the Gourlay Piano, because of its greater achievements in construction and tone-quality.

We ask you to examine a Gourlay for yourself.

Advantages of Being a Member of a Cow-Testing Association.

(Continued from page 589.)

take. Almost every member has something he would like to sell such as apples, grain, butter, hay and potatoes, and by selling direct to larger markets the middlemen's profits would be returned to the producer, to whom they rightfully belong. With a larger membership, but covering no more territory, co-operation in breeding, a very essential figure in improving the herd, would be possible. It is by these means that Denmark and Holland have made such rapid strides in the pursuit of agriculture.

But the testing association cannot do it all. It may be the farmer's right arm, but it takes a mind and a body to move it. You can put your name on the membership list and the tester can come to your house and show you what your cows are doing, but you can't raise your profits by this alone. You have information furnished by joining, but you have profit by using your information. Make use of your records, become acquainted with your cows, attend the association meetings; and whatsoever your hand findeth to do for the upbuilding of your herd and your association, do with all your might. It is surely the greatest educational movement of our country today, and a man's very character may be changed by it. It is but a step from discouragement to vice and immorality. Opportunity, with a capital O, is before the farmers today, and it comes in an appealing form. From inactivity and dissatisfaction, he is aroused to enthusiasm and contentment. The farm is a beautiful garden if you have the right utensils for digging weeds. Just sow the germ of this organization and leave it undoctored and you will have such a run of the cow-test disease, that. like a scarlet fever patient, you will come forth with an entirely new complexion.

What it has done for other countries and states, it can do for Maine. In Denmark, the work caused an average increase of 1000 pounds of milk per head in five years, and an average increase of 43 pounds of butter per cow for the same length of time. The states of Wisconsin and Michigan have made great advance in dairying, because it paid so well. Canadian farmers engaged in making cheese belong to associations because it pays.

And I am more glad than I can say that we are members of such an association and are working with that great purpose—improvement.—Mrs. E. R. Priest, Maine.

Feeding Grain to Milch Cows at Pasture.

Under advanced methods of dairy farming it is recognized as essential to the greatest success to maintain the highest and most uniform flow of milk practicable throughout the year. Now, when good pasturage is available the change from barn feeding to pasture is as a rule highly beneficial, both as regards yield and quality of milk and health of the cows, but even in good grazing regions there are frequently parts of the season, usually late summer, when the pastures are apt to become dry and thus make it a matter of much practical importance to find some means of keeping up the milk flow. For this purpose the practice of feeding either grain or soiling crops to supplement the pasture has been suggested. The economy of feeding grain to cows at pasture has been a subject of investigation by several of the experiment stations.

In experiments at the Kansas Station a number of years ago "two lots of cows each were fed alternately on rations consisting of pasture alone, pasture and bran, pasture and corn meal, and pasture and ground oats, for periods of seven days each." The conclusion was that although the grain feed added materially to the milk yield, corn meal showing the greatest increase, the increased returns did not pay the cost of the grain. In fact there was a considerable loss.

In experiments at the New York Cornell Station one lot of cows was fed, from June 8 to September 21, a daily ration of 2 pounds of cotton-seed meal and 2 pounds of bran per cow, and another lot was fed, from May 25 to September 17, 6 to 9 pounds daily per cow of a mixture of wheat bran 100 pounds. cotton-seed meal 100 pounds, and malt sprouts 15 pounds, in addition to good blue-grass pasture. In neither case was there any profitable return in milk or butter for the additional grain fed.

In experiments with cows soiled in the barn on fresh grass there was an increase in the milk and butter production and a saving in grass barely sufficient to pay the cost of the added grain ration.

To determine whether the profit from grain feeding would be greater in case of poorer pasturage a herd of cows on light pasture was divided into two similar lots, one lot receiving only pasture and soiling, the other, beginning May 23, was fed 4 quarts per cow daily (two feeds. night and morning), of a mixture of equal parts of corn meal, wheat bran and cotton-seed meal. "On August 10, the pastures having become dry. both lots began to receive ration of green corn fodder of about 16 lbs. per cow per day. On September 9. the corn fodder ration was changed to millet, which continued until Oct. , when second growth grass was used: this continued until October 13. when pumpkin began to be fed." The grain feeding in this case resulted in a profitable increase in milk production and also in a considerable gain in weight of the cows. The beneficial effect of the grain feeding was observable the following season, particularly in the development and performance of the younger animals (2-year and 3-year olds.)

At the Mississippi Station no benefit was derived from feeding 3 to 4 pounds of cotton-seed meal and 4 to pounds of wheat bran per cow daily to cows running on good pasture.

The question of grain feeding of cows at pasture has recently been investigated anew by J. H. Stewart and H. Atwood of the West Virginia Station. They found that there was no direct financial gain from feeding pounds per cow daily of a rather rich grain feed containing 16.5 per cent protein and 3.5 per cent. of fat to cows on pasture, notwithstanding the fact that in some cases the pasture became short from drought. "It is true that the cows which received grain were uniformly in somewhat better flesh than those that did not receive grain, but as far as the milk yield was concerned the increased flow was produced at an actual loss."

Summarizing the results of all the experiments which have been made on the subject, the conclusion seems justified "that unless dairy products are especially high in price it is not a profitable practice to feed grain to cows at pasture. It is true that more milk is obtained and the cows hold up their yield better and remain in better flesh when receiving the grain rations, but under ordinary circumstances there is no direct profit from the grain feeding, as the increased production usually costs more than it can be sold for."

IHC WAGONS HAVE STOOD THE TEST OF ALL LOADS AND ROADS FOR YEARS

THE real proof of the strength, durability, and value of I H C wagons is what they have done and are now doing for thousands of farmers throughout the Dominion. Light loads and heavy loads have been carried by I H C wagons, over good roads and bad roads, for so many years that there is hardly a farmer who is not familiar with the high quality that these names on wagons represent—

Petrolia Chatham

Either of these should be your choice if you want to be sure of lifetime service. The quality in both is the highest possible—the result of years of wagon-building experience, and the use of the best materials, shaped by skilled workmen operating with the finest manufacturing equipment.

Petrolia Wagons are constructed of the finest quality wood stock which is thoroughly seasoned by being air dried. The ironing is of the very best. The inspection of each part is most rigid. Petrolia Wagons must be made so that they will live up to the I H C standard of excellence or they are never sent out of the shops.

Chatham Wagons have a long record for satisfactory service in Canada. Made with hard maple axles, oak bolsters, sand boards, rims, and spokes, and oak or birch hubs—they represent the highest standard of wagon construction. When you buy a Chatham wagon it is with the assurance of getting the utmost service and satisfaction out of it.

Be sure to call on the I H C local agent. Get a pamphlet. Let him show you one of these wagons. If you prefer, write for literature or any other information you want to the International Harvester Company of America at nearest branch house.

Ans.—Mix one ounce of staves acre seeds in a quart of water and boil down to one and one-half pints, then add water to make one quart and use on infested parts. Repeat the application as found necessary. Clean up, fumigate, disinfect and whitewash the stables.

ECZEMA WAS SPREADING

Till D. D. D. Cured It.

This is a translation of a letter written us in French, on April 16, 1910, by Mr. Dan Babineau, Cap Lumiere, N. B.

"I had been suffering with eczema for about 6 months, and had consulted several doctors who did not do me any good. The disease was spreading and I was most uncomfortable. I thought I would go crazy. All my friends were telling me I would lose my hands unless I found the right treatment.

One day I read in the Messenger about your D. D. D. treatment and asked for a sample. It did me so much good that I immediately ordered two large bottles. It took eight bottles altogether to cure me of this terrible disease. I shall never be without a bottle of D. D. D. in my home."

The records of ten years of complete cures of thousands of the most severe cases show that D. D. D. stands to-day as the absolutely reliable eczema cure.

Write to-day for free trial bottle to the D. D. D. Laboratories, Dept. F. M., 49 Colborne St., Toronto. It will give you instant relief.

HOMESEEKERS' EXCURSIONS

The Grand Trunk Railway has issued a circular authorizing all Agents in Canada to sell Homeseekers' Excursion tickets to points in Western Canada. This is interesting information for those desiring to take advantage of these excursions on certain dates from April to September 1911. The Grand Trunk Route is the most interesting, taking a passenger through the populated centres of Canada, through Chicago, and thence via Duluth, or through Chicago and the twin cities of Minneapolis and St. Paul. Ask Grand Trunk Agents for further particulars.

Greatly Increased Patronage

Has compelled us to seek greater accommodation. Our new quarters, just across Hazen Avenue from our present premises, will give us nearly double our present space, and greatly increased facilities.

We are grateful for the patronage that has compelled this forward movement and will endeavor to maintain our reputation.

S. KERR

Principal.

A Valuable Feed.

Gluten meal is becoming more generally known within the past few years among farmers and dairymen. Gluten meal is the germ and residue of shelled corn after the starch has been extracted. Its feeding value is worth about seventy-five per cent. more than bran and about ten per cent. more than oil cake meal. As a feed it is very acceptable to cattle, useful for pigs and a capital feed for milk production.

In an interview with Prof. Grisdale, director of Dominion experimental farms, as to the merits of gluten meal he called attention to the fact that gluten feed was sometimes confounded with gluten meal. This is a very important point to be borne in mind when purchasing he said. The gluten feed is a mixture of gluten meal, oil cake, sweepings, etc. Gluten feed, while inferior to the gluten meal is worth from ten to fifteen per cent. more than bran and is more commonly sold because it can be purchased more cheaply. It shows by analysis only from eighteen to twenty per cent protein while the gluten meal shows from thirty to thirty-four per cent. protein. Either one is very acceptable to cattle and is easily digested, but as stated before the gluten meal is superior in feeding value. As a comparison in buying take bran as a standard. With bran selling at $20 per ton gluen meal is worth from $30 to $35 per ton while feed is worth only from $20 to $23 per ton.

A Cure for Hard Milkers.

Many a valuable cow and heifer have been sold at a sacrifice by the owner, owing to the fact that they were hard milkers. The cause of hard milking cows is so little understood by the average stockman that the disposal of such animals is accounted for in that way. But if stockmen know how easy it is to overcome hard milking in both cows and heifers, I am sure that no animal would be disposed of for the lack of treatment.

Hard milking is due to an abnormal contraction of the sphincter muscle, regulating the stream of milk from the point of the teat. On the other hand, when a cow loses her milk it is due to a relaxation or an abnormal expansion of the sphincter muscle at the point of the teat.

Many a valuable hard milking cow has been ruined, owing to the fact that the milker has been compelled to use a milking tube, and by the use of the milking tube the cow has become infected, oftentimes losing one or more quarters. It is not advisable to use a milking tube if one can possibly get along without it.

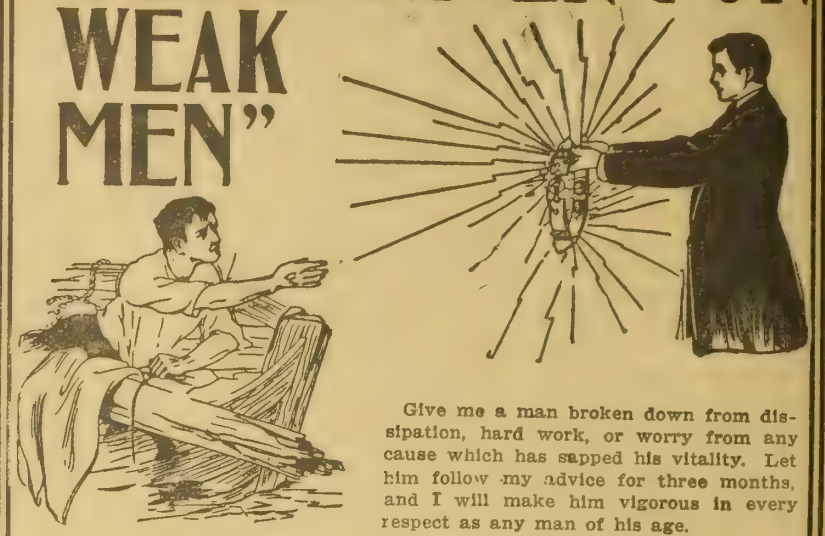
The proper method of handling or overcoming hard milking in cows or heifers is by the use of a teat plug. The teats should be washed with a germ-killer solution and the teat plug dipped in the same solution, then dipped in a little healing ointment and passed into the point of the teat. The teat plug, being self-retaining should be permitted to remain in the teats from one milking to another. This will positively overcome hard milking in cows and heifers.

Skim milk is one of the most important by-products of dairying. It is too valuable to let it go off the farm.

Ground corn should have a place in the ration but it should not predominate to the exclusion of all else.

A little attention to a cow just before freshening will often prevent a case of milk fever.

"A LIFE SAVER FOR WEAK MEN"



Give me a man broken down from dissipation, hard work, or worry from any cause which has sapped his vitality. Let him follow my advice for three months, and I will make him vigorous in every respect as any man of his age.

I will not promise to make a Hercules of a man who was never intended by Nature to be strong and sturdy. Even that man I can make better than he is; but the man who has been strong and has lost his strength I can make as good as ever he was.

I can give back to any man what he has lost by abuse of the laws of Nature.

You Run No Risk in Using My Belt. I Take All Chances

Do you doubt it? If so, any man or woman who will give me reasonable security can have my Belt, with all the necessary attachments suitable for their case, and they can

PAY WHEN CURED

Dr. McLaughlin: Peterboro, Ont.

Dear Sir: I am very thankful to say that I feel much better, both in strength and health. My back is not like it was, for I can do a day's work now much easier than I could before using your Belt. I now wake up in the morning feeling fresh, not like before, when I had that languid feeling. I have more life in me now. I am well satisfied w th the Belt. I only wish I had obtained it before.

Yours Truly,

A. RICKARDS.

Every man should understand that physical power, large muscles and strength of endurance come from animal electricity. My treatment will pump every part of the body full of that and perfection will result.

It not only restores vigor and increases nerve power, but it cures rheumatism, pains in the back and kidneys, indigestion and constipation, and all troubles which result from weakness of any vital organs.

How the Milk Can May Become Mightier than the Milk Bottle.

Referee Brown, of Milk Trust Fame offers a new solution of the people's problem—the bottled product not the purest milk—danger in the Piping System.

No less an authority than William Grant Brown, the widely known attorney, who achieved national fame by his investigations into the so-called milk trust case in New York, believes he has solved the pure milk problem in a way so ingenious that it commands attention.

Mr. Brown calls his invention the anti-monoply milk can. He has been investigating the many sided milk production and sale conditions for two years.

"I believe," he said at his residence, Bretton Hall, New York City, "that this milk can of mine will dispose of the expensive idea, to the consumer,—that bottled milk is the practical means of obtaining pure milk, so far as the consumer is concerned.

"Close study reveals to anyone that the more milk is handled, the greater opportunity for increase in bacterial count. The secret of pure milk is, maintaining purity at the source of production and avoidance of all rehandling possible, at the same time preventing fluctuation of temperature.

"The new milk can consists of a wooden barrel swung on trunions an inner metal milk can, and a sealed glass measuring device on top. The barrel remains in the retailer's store. The milk can is shipped in each day direct from the farmer-dairyman, or through the milk contractor, just as the regular loose top cans come in today. But this new milk can is radically different from the old. Its top is locked on by a tool exclusively owned by the shipper, who then seals it with a lead seal, stamped with his name.

"Thereafter, the cover cannot be removed without at least breaking this seal. After the milk has been sold from the can in the retailer's store, it travels back empty with its seal unbroken. In other words, it is impossible to put anything into the can or get anything out of it, which means that adulteration by water or skimming the cream is positively done away with."

"How does the dealer dispense the milk?"

"This is accomplished by the plunger device, consisting briefly of a spout, surmounted by a glass cylinder which holds a quart of milk. When the can arrives at the retail store it is placed in the tipping barrel and surrounded with cracked ice. The wooden top of the barrel is then locked on.

"In the wooden top there is a small orifice, and directly under it another in the top of the metal can, which latter is constantly closed by a ball-locking device from within.

"Now the plunger device is inserted into the orifice. The tube part of it penetrates the metal can and unlocks the ball device. With the plunger top the retailer measures the amount of milk asked for by the customer, the latter being able to note this measurement in the glass cylinder and see that it is correct. All that remains is to tip the barrel. The milk runs into the glass cylinder, fills the space measured, and then when the barrel is swung upright, runs out of the spout into the purchaser's pail or bottle.

"Now enters what the Department of Agriculture authorities at Washington consider the most important feature of this novel can. Within the metal can is a removable partition of sheet metal, preforated with nine or more holes. This is a mixer. It will have been noted that every time an amount of milk—even the smallest—is drawn the barrel must be tipped over till it is horizontal in position, and then tipped back. This operation sends the milk inside rushing through the holes of the partition and thoroughly mixes and equalizes it with each tipping movement.

All this means cheaper milk for the consumer, the abolition of the ultra expensive classification system of bottling milk, which is sending prices higher every year. It means pure milk for the poor, as well as for the rich."

The bottling proposition, although it has been of assistance in creating higher milk standards, has drawbacks which seem well-nigh insurmountable, so far as extensive production along lines of strict milk purity is concerned at anything like moderate prices.

Chief of these drawbacks is the vast amount of piping in the bottling establishments of most milk companies, especially in the factories of the largest of all the milk companies operating east and west. Only miraculous methods would keep these pipes germless.

The piping question has, in fact, become so serious that even the Walker-Gordon Milk Company, whose prices are so high as to be practically prohibitive, except in the homes of wealthy, use only four feet of pipe in the bottling process. The "anti-monoply" milk can seems a long step in the right direction."

Potatoes Will Make Fuel.

Culled potatoes will be furnishing the power for the gangplow and the engine on the farm before many more years go by.

A bushel of culled potatoes is worth fifty-six cents. Turned into denatured alcohol they would be worth seventy-two cents. The process of extracting the alcohol is not one that every farmer can carry on, but the alcohol is there all right.

Alcohol is produced by the fermentation of sugar. Potatoes contain starch that may be converted into sugar by the addition of malt and then fermented. The potatoes are steamed until the starch is cooked thoroughly. Then the malt is added. When the starch has been converted into sugar a yeast mash is added and the sugar is fermented. What is left from the potato mash can be fed to cattle. Experiments have proved that the mash has a high feeding value.

Denatured alcohol is used for heating and lighting, in chemicals, in varnishes, in explosives and as a fuel for engines. For some years the tax laws were such that alcohol was too expensive as fuel for engines. For this reason machinery has not been adapted for using denatured alcohol. But it is coming into use.

The United States Department of Agriculture has issued a bulletin recently on this subject. Denatured alcohol is being extracted from potatoes in other countries with success.

A distillery for this sort of work might be conducted by a farmer's co-operative association or as a private enterprise. A plant with a daily capacity of eight thousand pounds of potatoes would cost approximately $12,000. This is larger, considerably, than would be practicable for a co-operative enterprise. The plant would have to be in a potato growing country with good railroad facilities.—Kansas Industrialist.

PAQUET GUARANTEED CLOTHES

THE MOST PERFECT METHOD OF Clothes Making Yet Devised.

CLOTHES, to fit perfectly, MUST be made to measure. The old-fashioned, Ready Made Clothes are all made to fit AVERAGE types, not REAL men. That's why they don't fit YOU. PAQUET Guaranteed CLOTHES are NOT Ready made. They are cut to your exact measurements BEFORE they are made up. Our new method makes this possible. It is the most perfect method of Clothes Making yet devised.

PAQUET Guaranteed CLOTHES give you all the advantages of Custom Tailoring at HALF the expense. The materials used are of the highest grade procurable. They are sold direct to YOU at Wholesale prices, and are GUARANTEED to be the best value in Canada to-day at from $10.00 to $15.00—worth $13.50 to $20.00.

The most highly-trained experts only are engaged in the production of PAQUET Guaranteed CLOTHES.

THE SUIT ILLUSTRATED is made from absolutely PURE WOOL navy or black serge, best Indigo Dye, thoroughly shrunk and absolutely guaranteed to keep its color. The workmanship is unexcelled in this Country. The pockets are made according to our special process and will neither sag nor get out of shape. The real value is $13.50. Our Special Price, PREPAID to any part of Canada **$10**

Sizes 36 to 44 only. Larger sizes 75c per size extra.

Result of Experiments.

Editor Maritime Farmer:—

As the fertilization of crops is naturally being conducted more or less by most farmers at the present time, the following results may not prove uninteresting. These figures were obtained by averaging the results of 107 experiments, conducted in various parts of the Dominion, by reliable farmers, in conjunction with the Dominion Offices of the Potash Syndicate during the years 1907-1910 inclusive. These tests were made on various classes of soils and under varied climatic conditions so that the average obtained for the four years should have more than passing significance.

The crop chosen was the potato crop as it was considered that the results obtained would have a wider interest throughout the Dominion, as the potato is perhaps the most commonly fertilized of all the field crops.

While the amounts of the various fertilizer ingredients given are a little in excess of the quantities most generally used in practice, particularly where a dressing of barnyard manure is applied, they were considered satisfactory for this purpose.

The prices used in estimating the cost of the fertilizers were as follows:

Sulphate of Potash, $3.00 per 100 lbs.

Acid Phosphate, $1.00 per 100 lbs.

Nitrate of Soda, $3.00 per 100 lbs.

These prices are also slightly higher than those paid by most farmers, except where very small quantities are bought. A perusal of the table given, explains itself, should prove interesting.

No. of Plot.	Fertilizer applied per acre.	Average yield per ac. bush.	Increase over fertilized plot.	Value at 50c per bush.	Cost of Fertilizers.	Profit after deducting cost of Fertilizer.
1	Unfertilized..... Lbs.	175				
2	Sulphate of Potash.....200					
	Acid Phosphate.....400					
	Nitrate of Soda 150	260	85	$42.50	$14.50	$28.00
3	Acid Phosphate.....400					
	Nitrate of Soda.....150	216	41	$20.50	$8.50	$12 00

(Sgd.) WALTER SHIRLEY.

Fruit Crop Report No. 1.

(Continued from page 585.)

sert purposes than cooking purposes. They, therefore, occupy a special position in the market.

District 5 has comparatively few trees. The quantity of fruit raised here is not enough for home consumption, so that it need scarcely be taken into consideration in an estimate of the crop for commercial purposes. This district includes New Brunswick. The possibilities of orcharding in the St. John valley are so great that there is a probability in the future of having to make a separate division of this part of district 5 to secure greater accuracy in the estimate.

District 6 is an exceedingly important one in apple production. It includes the four counties of Hants, Kings, Annapolis and Digby in Nova Scotia. It would be quite possible, considering the high state of cultivation in which a large number of the orchards are kept, to have a surplus of five or six hundred thousand barrels for export.

It will be readily seen that this is a very important fruit district in estimating the marketable crop for any particular year. The Gravenstein forms the largest bulk of their earliest shipments. This variety, however, is being less planted, and the district is becoming more and more confined to the winter shipping varieties. The Blenheim Orange type appears to flourish better than the varieties so successful in districts 1, 2 and 3. These are extremely popular in the English market, and, therefore, are always likely to be in good demand.

District 7 embraces the rest of Nova Scotia not included in District No. 6. A few isolated and protected valleys, particularly in the counties of Lunenburg and Digby, are demonstrating their capacity for growing fruit in commercial quantities, but as a whole it may be said that there is not enough winter fruit grown for home consumption, nor is there sufficient quantity to affect appreciably any results obrained from the other divisions.

District 8 includes Prince Edward Island. There is a small quantity of which may increase somewhat in the near future, but is not enough at present to appreciably affect the market. This district still imports winter fruit for home consumption.

District 9 includes the valley of the Fraser River from Lytton southward, the lower coast line and the Island of Vancouver in British Columbia. This is a mild and moist climate, favorable to fruit growing which is carried on under very different conditions from those prevailing in District No. 10.

District 10 includes the interior valleys of British Columbia, which have a comparatively dry, warm climate. Irrigation is required in many of these valleys, and it is therefore desirable that they should be grouped together, inasmuch as though they differ among themselves slightly, yet for commercial purposes the fruit is simi,ar.

Districts 9 and 10 are becoming much more important factors in estimating the total crop of the Dominion.

The Effects of Spraying.

From all quarters comes the complaint that the apple trees are covered with worms which are eating leaves and buds and people are asking what they will do to save their trees. These worms are the ordinary tent caterpillar which is more or less plentiful every year and this seems to be one of the "more" years.

This pest never appears in a well cared for orchard and the demonstation work done by Provincial Horticulturist Turney at several orchards is bringing this very forcibly to the of fruit growers near these orchards.

Mr. J. W. Clark, part of whose orchard at Maugerville, is being used for demonstration work by the Provincial Horticulturist, reports that not a worm is visible in his orchard and that on that part where the strong lime sulphur spray was used before the buds opened that none of the eggs hatched. Other orchardists who have used only the weak lime sulphur and poison spray before the blossoms opened state that all the Caterpillars are dead. Orchards

Poultry Fencing that is Stronger than Seems Necessary

We make our poultry fencing close enough to turn small fowl—then we make it extra strong, so it will last for years and keep the cattle out. The heavy, hard steel top and bottom wires hold it taut and prevent it from sagging.

PEERLESS POULTRY FENCE SAVES EXPENSE

It is well galvanized so as to protect it from rust. It makes such a firm, upstanding fence that it requires less than half the posts needed for the ordinary poultry fence, and that means a big saving to you. Write for particulars.

We make farm and ornamental fences and gates of exceptional quality. Agents wanted where not now represented.

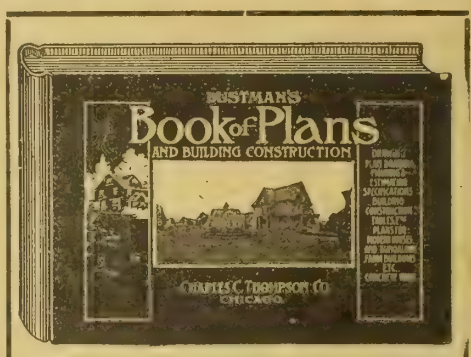
Dustman's Book of Plans

—AND—

BUILDING CONSTRUCTION

By U. M. DUSTMAN
(Licensed Architect.)

10,000 sold in 30 days



Price, $2.00 Prepaid

Here's a different book from those upon the market. It contains information not generally known outside the building trades; just such information which the building public want. The author has written a book in which he has embodied the cream of over thirty years successful experience. He is widely known as a practical and expert architect and is an authority on the construction of medium priced homes.

Everyone interested directly or indirectly in building should have this book. 250 pages; oblong size, 9x13 inches; bound in blue cloth; white hand stamping—150 plans for modern houses, bungalows, barns, farm buildings, store fronts, store buildings, garages, etc., etc.

CONTENTS

General Construction Plans—Arrangement of Rooms—Things to be Considered in Laying Out a Building—Heating Facilities—How to Estimate Cost—Figuring Amount of Material Required—Time Saving Tables—Mechanical Drawing and How it is Applied in Construction of a Building—Plans with Estimated Cost of 150 Houses, Bungalows, Barns, in Frame, Concrete or Brick Construction—Country Houses—General Barnes, Cattle and Horse Stables—Dairy Barns—Poultry Houses and Silos—Hints as to Best Style of Structure—Details of Interior Construction and Finish—Window and Door Framing—Stairways—Store Fronts—Roof Construction—General Directions for Mixing and Placing Concrete—Proportions—Sand and Gravel—Itemized List of Material Costs—Writing of Specifications.

This book will be sent, together with a year's subscription to The Maritime Farmer, to any person upon receipt of $2.00. That is if you are already a subscriber and will send us two dollars we will send you the book and give you credit for one year's subscription. If you are not already a subscriber and want the book, you may obtain it and The Maritime Farmer for $2.00. These books cannot be purchased anywhere for less than $2.00 each and they are a bargain at the price.

THE MARITIME FARMER,
SUSSEX, - N. B.

where no spraying has been done are mostly alive with caterpillars that are working serious damage to the leaves and blossoms, and many enquiries as to what is best to do are coming to the Department of Agriculture.

As it is not wise to give a general spray while the tree is in blossom all that can be done until the blossoms fall is to try and kill or remove the caterpillars while they are massed on the limbs by hand, or to spray them with paraffine oil in the mass. As soon as the blossoms fall, a spray of Lime Sulphur solution in the proportion of one gallon Lime Sulphur to 40 gallons of water, or Bordeaux Mixture, with either 12 ounces of Paris Green, or 2 lbs. Lead Arsenate to each 40 gallons mixture should be given all orchards to kill caterpillars help prevent Black Scab and kill the Codling Moth Worm. This spray must be given before the calyx of the blossom closes up to be effective.

A Bulletin by Provincial Horticulturist, A. G. Turney, dealing with the care of orchards and giving full directions as to spraying is just off the press and now ready for distribution. It may be had free, on application to the Department of Agriculture, Fredericton.

Foal Troubles.

A Subscriber. I have a large seven year old mare that was due to foal on the 21st of April, but she dropped him on Easter morning. She had no milk although I fed her good hay and whole oats, three times a day. She had a foal two years ago and had plenty of milk. Would it be advisable to breed her again? How should a young foal be fed? How long should navel cord be cut? The foal in question lived only one week. He first took lame in one leg then in all legs and died after a few days. I find that the Maritime Farmer is just the paper our farmers need.

Ans.—Sometimes a mare will deliver a healthy foal and not furnish milk for it. The cause of the suppression of milk secretion is frequently obscure, but is often caused by a feverish condition due to some derangement of the digestive system brought about by insufficient succulent food or exercise, perhaps both. Will advise breeding her again and feeding her during pregnancy good hay, oats, bran mashes and some roots. Feed bran mash twice a week governing the quantity by the condition of the feces. Keep the bowels regular and the feces neither too soft or dry. Give well regulated exercise daily and water frequently and the probability of milk secretion will be good.

A young foal that is not fed by its mother and that the mother does not furnish milk for, should be fed cow's milk, warm and sweet, frequently every 3 or 4 hours at first, gradually lengthening the time between feeds until about eight hiurs when it is 6 weeks old. Set the milk and allow the cream to rise for a few hours, remove the cream and add a small quantity of sugar, warm the milk and feed from 3 to 6 ounces at a feed governed by size of colt and increase the quantity as the time between feeds is lengthened.

As to length of naval cord, when it breaks naturally, it does not require cutting and when it has to be cut, one or two inches is quite sufficient to leave. That gives sufficient length to apply a cord around the naval cord, which is generally necessary to prevent bleeding when the navel cord is cut and occasionally when it breaks naturally. It is also advisable to apply some antiseptic to the naval, as a five per cent. solution of creolin or carbolic acid in water yo prevent infection at that point. It is also advisable when a colt does not receive the first milk from its mother to give an injection per rectum of about half a pint of warm water and one ounce of glycerine mixed.—J. Standish, V. S.

A Mysterious Disease Among Bees.

A mysterious disease among bees which has devastated apiaries in the southern counties of England was discussed at the meeting of the Council of the National Fruit Growers' Association, held at the Horticultural Hall.

The disease is believed to be caused by a bacillus akin to that which causes plague in human beings. Whole hives are speedily affected, and the bees, first losing their power of flight, crawl out of the hives and die. No efforts have been successful in checking the disease, which first appeared in the Isle of Wight.

Professor E. S. Salmon said the disease threatened the fruit-growing industry unless adequate steps were taken to keep it in check, as it was necessary for bees to visit flowers if good crops were to be secured.

Mr. C. S. Martin said that unless steps were taken to cope with the disease it would spread all over the country in two years.

The Council passed a resolution asking the Imperial College of Science to make a thorough scientfic investigation of the disease. They pointed out that it had spread to apiaries in the fruit-growing counties, and was likely to cause considerable loss in view of the fact that crops of apples, pears, gooseberries, and other fruits were largely dependent on visits of bees to the flowers.

Chamberlain's Stomach and Liver Tablets will clear the sour stomach, sweeten the breathe and create a healthy appetite. They promote th flow of gastric juice, thereby inducing good digestion. Sold by all dealers.

The McCormick Reel is the Strongest and Most Efficient Ever Placed on a Binder

THE McCormick reel offers a wide range of adjustment which successfully meets the conditions encountered in any field, whether the grain is tall or short—standing, down, or tangled. Grain that is filled with green undergrowth is forced upon the platform with ease. The guards are placed so that the machine can be tilted to cut close to the ground without pushing trash and stones ahead of the knife.

The McCormick knotter is a revelation of simplicity in construction, accuracy in tying, and ease of adjustment. Only two moving parts constitute the working mechanism. There is no straining or pulling on the twine, and perfect knotting is assured.

The McCormick floating elevator handles grain of any length or weight without clogging.

The McCormick line of haying machines and tools is as efficient as the binder.

The McCormick dealer will tell you all about these advantages and many others. Why not see him today? If you prefer, write to the nearest branch house for catalogue and any special information you desire.

Butter Problems.

2. How much butter should I get from two gallons of separator cream?

2. I churned 36 pounds of cream and only had six pounds of butter, which I think is not nearly enough, one cow being a Jersey.

3. Is there any difference in separators? I have a ———and some have told me that they smash up the cream and are not as good as some other makes. I would like to know what is wrong knd why I do not get more butter out of the quantity of cream.

1. As separator cream varies a great deal in the percentage of fat which it contains, no definite answer can be given to this question. Butter also varies in its composition as to moisture, curd, salt, etc., making another factor in the question which causes difficulty in giving an answer. Then also there are losses in handling the cream, and in the buttermilk. However, assuming that the cream tests 25 per cent fat. such cream would weigh about ten pounds to the gallon; therefore, two gallons would contain 20 by 25 divided by 100 equal five lbs fat; and assuming further that the buttermaker is a skilful, careful person, he or she would be able to make an "over-run" of 20 per cent. which is one pound, making altogether 5 plus 1 equals 6 lbs. butter. Therefore, two gallons of average separator cream would produce about six pounds of butter. If the cream tested 30 per cent fat, a person could make about 7½ lbs. butter, and if it tested 40 per cent fat, over 9½ lbs. butter could be made from two gallons of such cream.

2. If 36 lbs. of cream produced but 6 lbs. of butter, the probabilities are that considerable butter (fat) was lost in the buttermilk. If the cream tested but 18 per cent. fat, then six lbs. butter would be a fair yield from 36 lbs. cream.

3. There is a very maked difference in cream separators of the various makes, and also quite a difference in machines of the same make. Some binders, mowers, etc., from a firm always work better than others, although apparently they are alike. Separators are similar.

I should advise having the skimmilk from this machine tested for fat. If the test is .05 or over, then the machine is not doing good work, and it ought to be remedied, or a new machine purchased.

If the speed were increased and the feed decreased slightly, condiitions would be more favorable for "clean skimming."—Answered in Ottawa Valley Journal by Prof. H. H. Dean.

What Constitutes Good Plowing.

The answer to this question will be modified by conditions that are more or less local in their application. These include the nature of the soil, its mechanical condition, the humus supply and the crop that is to be grown.

Humus soil with good, natural drainage will grow crops if turned over to a sufficient depth to cover all the stubbles and weeds that may be growing in them, regardless of the width of the furrow slice. With increasing heaviness in the soil comes increase in the demand for narrowing the furrow slice and for laying it on such an angle as will admit of harrowing down in due time the crest of the overturned furrow. The difference in the width of the furrow slice runs all the way from eighteen to seven inches.

Should the soils have good, natural drainage, they may be left as level as possible; but if they are liable to suffer from excessive wet, they should be plowed in lands or ridges that are highest in the centre. These ridges vary in width from ten feet to several times that width. When the land is plowed in ridges, it adds much to the appearance of the work if the furrows are drawn straight and even.

The mechanical condition of the soil materially influences plowing. Good plowing in sandy soil turns a shallow furrow. In stiff soil it turns a deeper furrow. In practically all soils the furrow slice should be turnded at an angle. In waxy soils the plowshare must be kept scoured, or it will not do good work.

The humus or vegetable matter in the soil affects the character of the plowing to be done. Especially is this true of land that has grown wedds or grass. No plowing is deserving of the appellation good that does not completely bury weeds and stubbles. When plowing sod land, if a skimmer is attached to the beam in front of the colter, grass will be completely hidden. A skimmer is a miniature colter.

The plowing should have a careful regard to the kind of crop grown. Some crops call for deep plowing, as corn and field roots, and some for plowing that is shallow. No plowing could be called good that is not adapted to the needs of the crop in regard to depth, whatsoever its other characteristics may be. On nearly all southern soils no plowing is really good that is not deep, and on the blow soils of the prairie no plowing is good that is deep. Thus do conditions affect plowing.

Damage by Cutworms.

At the beginning of the growing season the gardner often finds in the morning young plants cut off near the surface of the ground that the evening before were strong and healthy. On stirring up the soil near by he may find hidden in the ground a greasy-looking caterpillar, the culprit in the case. Cueworms, so called from this habit, are the caterpillar of dull-colored night-flying moths of a great variety of species and varying to some extent in their habits. As a general rule they are partly grown at the approach of winter and hide away in a torpid state during the cold weather; when restored to activity by the warmth of spring, which causes the buds to open and the growth of plants to begin, these worms come out in search of food and attack any kind of tender vegetation that they meet with. They are nocturnal in their habits and hide away during the hours of daylight under any shelter they can obtain or just below the surface in the loose soil of newly made beds. Owing to their destructive practice of cutting off a whole plant in order to devour a portion of its foliage, they do a great deal of apparently needless damage.

After they have become fully grown they change to the chrysalis stage in the ground and in early summer the moths appear, many of them making their presence known in our houses by their attraction to light. Before very long another brood of caterpillars comes upon the scene, often more numerous and more destructive than the first. Some of them climb into fruit trees and destroy the foliage, others attack farm crops, vegetables, grape vines, the plants in flower gardens, etc., while occasionally a single species appears suddenly in enormous numbers and sweeps like an army over the land devouring everything that comes in its way.

Happily a very simple and completely effective remedy has been found for these destructive creatures. It is called the "poisoned branmash" and is made in the following manner: Mix half a pound of Paris green in 50 lbs. of bran (the proportion for larger or smaller quantities is 1 to 100); the poison should be added to the dry bran little by little and stirred all the time till the whole is tinged with the green color, then add water sweetened with sugar or molasses till the mixture is sufficiently moistened to crumble nicely through the fingers. If bran cannot be procured, shorts or flour may be used, and for field work may be distri-

This New Portable, Pitless Wagon and Stock Scale is

Wear Ruthstein's Steel Shoes—

For Comfort, Health and a Saving of $10 to $20

N. M. RUTHSTEIN
The Steel Shoe Man—he has made a million feet happy.

HALF a million people have bought my Steel Shoes. Every pair was sent out on Free Examination. Every pair *could* have been returned. But the half million people recognized *at once* what my Steel Shoes meant. Today, not one of them would do without my Steel Shoes. They know now perfect foot comfort in all kinds of work—in all kinds of weather. They know what it means to be free from wet feet, and all resulting sickness, such as colds, rheumatism, neuralgia, sore throat, and even the dreaded pneumonia. They know what it means to be free from corns, bunions, callouses, and sore, aching, tired feet. And they know **real shoe economy.** For the half million Steel Shoe wearers will each save $10 to $20 shoe money on every pair of my shoes. Steel Shoes outlast 5 to 6 pairs of ordinary shoes.

Don't **you** want to join this great army of health-savers and money-savers? Don't **you** want to do **your** work without your feet bothering you? Don't **you** want to save about $10 on **your** shoe money every year? **Then wear Steel Shoes,** like the half million that are now doing it!

No More Wet or Cold Feet

There is nothing in the world like my Steel Shoes. Nothing can even compare with them. The soles are stamped out of a thin, rust-resisting, seamless, special process steel. This steel extends from heel to toe and up around the edges. There are no cracks or seams. The soles are studded with adjustable steel rivets which protect them from wear and give a sure, firm footing. When rivets wear out they can easily be replaced by yourself. Fifty rivets cost 30 cents and they will keep your shoes in good repair for two more years.

The uppers are made of the very best quality of pliable, water-proof leather, fastened forever to the steel bottoms. Water or cold cannot penetrate my Steel Shoes. Thus they keep your feet always dry and comfortable! And Steel Shoes have inner soles of springy hair-cushion which gives elasticity to tread and absorb jar when you walk on frozen ground. But comfort isn't all. You

To Dealers—

Get in line with the leading merchants of Canada and supply your customers with my Steel Shoes. Save them the bother and delay of ordering direct—as they do when dealers disappoint them. A man who knows Steel Shoes will have no other kind—he knows their extra-comfort, extra health and economy features. Write for terms today to Blachford, Davies & Co., Ltd., 60 62 W. Front St., Toronto, Canada's Leading Shoe Jobbers.

Do it *now* and give your customers a square deal on the work shoe question.

Save Doctor Bills

Prevent Rheumatism, Colds, Neuralgia, Corns Bunions, Etc.

Most every man puts more weight on one side of his foot than he does on the other. This causes heels and soles on leather shoes to wear down at one side—running over—giving an uneven standing surface—which throws the weight to one side—on your ankles—and puts the entire body out of balance. The result is crippled, sore, aching feet, tired ankles—every muscle strained and every step a strain and pain. Do you know the real reason why you get so tired standing on your feet all day tramping around? It is a hundred to one that you have broken down the instep of your leather shoes, making you stand flat-footed. There's where the fatigue comes in. Thousands of people have their shoes made to order putting in steel shanks to prevent this. Every pair of Steel Shoes that I make prevents it. But that isn't all. Steel Shoes protect your health in many ways. They are easy to wear and dry as powder. Cool in the summer, warm in the winter and dry all the year round.

Outwear 3 to 6 Pairs of Best All-Leather Shoes

Note the quality of the uppers. See the turned-up steel soles—and how everlastingly they are fastened to the uppers. Note the adjustable rivets which can be replaced at a trifling cost when worn down. Examine every part carefully. Satisfy yourself that Steel Shoes are the only kind of work shoes fit to wear. Nearly every progressive, wide-awake dealer in Canada sells and recommends Ruthstein's Steel Shoes. Go to **your** dealer. If he can't supply you, order direct from me. I'll send you a pair—the size and style you want at these prices—and I'll send them out on free examination. Made in all sizes from 5 to 12, for boys and men. 6-in. high—$3.00. 6-in. high with **extra grade of leather**—$3.50. 9-in. high—$5.00. 12-in. high—$6.00. 16-in. high—$7.00—the best shoe on the market regardless of price. Boys' Steel Shoes—sizes 1 to 4. 6-in. high, Boys' Steel Shoes—$2.50 per pair. 9-in. high, Boys' Steel Shoes, black or tan—$3.50 per pair. In ordering give correct size. Boys' Steel Shoes will **please the boy and save you money** and worry.

I strongly recommend the 6-in. high Steel Shoes at $3.50 and the 9-in. high Steel Shoes at $5.00 per pair as they give the best possible satisfaction. For all classes of use requiring high cut shoes the 12 or 16-inch high Steel Shoes are absolutely indispensable.

Start Wearing Them At Once Ask your dealer, but if he can't supply you, order right from this advertisement if you are in a hurry. Be sure to state **size of shoe you wear.** You take no risk. Money back if not exactly as I say or if you are not satisfied when you see my Steel Shoes. See my dealer at once—or order from this advertisement. Anyway send for my book—"The Sole of Steel," it is free. Address me personally—

FREE Write for my book, "The Sole of Steel." But order your pair now in a hurry.

U. S. Factory, Racine, Wis.
Great Britain Factory, Northampton, Eng.

buted dry by means of a seed drill. The mash should be scattered about the plants that are liable to attack in the evening, and strange to say the worms will devour it in preference to their ordinary vegetable feed. When they begin to feel the effects of the poison they wander off to find a hiding place, or burrow in the ground and there die. Their dead bodies will be readily found in the morning just below the surface of the ground, often in surprising numbers. Young plants such as cauliflowers, tomatoes, etc., may be protected when set out by wrapping a bit of newspaper around the stem between the root and the leaves and reaching a little below the surface of the ground. The worms will not attempt to bite through or climb over it.

Decreasing Fertility of Wheat Fields

In writing about the capacity of the wheat growing districts, it is often assumed that the soils are practically inexhaustible, but investigations show that, rich as the soils may be, each succeeding crop of wheat abstracts its share of plant food, and that, as time goes on, the crops grown on the rich prairie lands will gradually diminish.

This fact is brought out in the investigations of Mr. Shutt, the chemist of the Dominion Experimental Farms, who has been studying the Western prairie soils, their nature and composition.

We find that, with regard to nitrogen, although the cultivated soil is still very rich, yet when compared still very rich, yet when compared with the untouched prairie, it has lost practically one-third of this most important constituent.

A quite marked falling off in phosphoric acid is also to be noted, though what is perhaps of more significance is the reduction in the proportion of this element in the available condition. Since loss of phosphoric acid cannot be accounted for save in removal by crops, it would seem that in continuous grain growing the rate of abstraction exceeds that of conversion, a probability to which we have already referred.

In the "total" potash the differences throughout the series are not large, but, as in the case of phosphoric acid, we find that the percentage of "available" in the cultivated soil is considerably less than in that of the prairie.

Sure Sign.

The applicant told the boss farmer that he had been a farmhand for many seasons, and although the stranger had no recommendation, the boss set him a task. After hoeing all morning, the new man came to the house for dinner.

He washed at the bench outside the door with great vigor, splashing the water from the washbasin and rubing his face with energy of a true farmhand. The boss watched him.

When the other had hung up the towel and started for the house, the boss spoke.

"Say," he said, "didn't you tell me you had worked on farms before?"

"Sure I did."

"Well, look at that washbasin, will you?"

"What's the matter with the washbasin?"

"It's rinsed out and left clean for the next person—that's what's the matter with it, you counterfeit farmhand! There never was a real one yet that didn't leave the basin full of suds when he got through washin'."

Prevention of "Finger and Toe" in Turnips.

The problem of dealing successfully with the mysterious disease, known as "Finger-and-Toe" in turnips is perennial, and seems as insoluble as the prevention of the terrible cancer disease in man and animals. Eventually science may discover a remedy for both diseases, as experiments and investigations are continually being conducted.

The Professor of Agriculture at the West of Scotland Agricultural College, Mr. R. Patrick Wright, has just issued a report of a set of experiments carried out by him with the object of testing the effect of the application of substance, which have the reputation of being useful in warding off attacks of "Finger-and-Toe."

These materials are lime in different forms, sulphate of copper and kainit. The experiments were made on turnips grown in a field poor in lime and very much infested with the disease.

The report embodies full details of the results obtained, and the conclusions arrived at are well worth noting by our readers. They are:—

1. The destruction of the turnip crop by the disease known as "finer-and-toe" can to a certain extent be prevented by the application of suitable dressings of lime.

2. On land much infected, dressings of lime of less than 2 tons per acre cannot be relied on to produce much effect.

3. On land much infected, applications of 4 tons per acre are more successful, but will not entirely destroy the disease or save the crop.

4. Lime applied in the drills in spring is much less effective in preventing the disease than when put on the land in the preceding autumn.

5. Small dressings of lime applied either in autumn or in spring have little effect on disease.

6. Lime slaked in small heaps by atmospheric moisture is distinctly less effective in preventing the disease than the same lime (CaO) slaked by pouring water over it when fresh from the kilns, and spreading over the land while it still remains in a caustic condition.

7. Ground lime is more expensive and no more effective than an equal quantity of properly slaked lime.

8. Sulphate of copper applied at the rate of half a ton per acre has no immediate effect in saving the turnip crop from the "finger-and-toe" attack, but is ultimately injurious to the disease fungus.

9. Kainit applied in the same quantity in spring to the turnip crop has no effect in protecting it from a "finger-and-toe" attack, but its subsequent action in the soil is detrimental to the "finger-and-toe" fungus, and beneficial to succeeding turnip crops.

IS THE WORLD'S GREATEST SEPARATOR

The **"Standard"** is the nearest approach to Cream Separator perfection ever accomplished, not only in skimming but in every way. It is constructed on approved mechanical principles and materials of the highest standard only are used. Its cost is very little higher than ordinary machines and its productivenes is 25% to 40% greater than the old method of skimming and 10% to 25% over all other separators.

Agents Wanted in Unrepresented Territories.

The RENFREW MACHINERY CO., Ltd., H. A. McArthur, Sussex, N. B. Mgr. for Maritime Provinces.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad. as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

A. STROUT, Kent's Hill, Maine.

Advertised products usually possess special points of merit. That is why they are advertised. When you buy goods advertised in The Maritime Farmer you are sure of getting square deal.

A meeting of the Directors of the Maritime Stock Breeders' Association will be held in the office of the Winter Fair Building, Amherst, N. S., on June 8th, 1911.

Crop Statistics.

Ottawa, May 10. A bulletin of the Census Office issued today makes the following report on the crops and live stock of Canada.

The seeding and growing season for the whole of Canada has opened late this year, and the month of April has been marked by hard frosts. But May has been favorable to cultivation of the land, and the rainfall has been sufficient for healthy vegetation.

Fall wheat, which is grown chiefly in Ontario and Alberta, showed an average condition of 82 per cent. at the end of April, being 89 per cent. in Alberta and 81 per cent. in Ontario. In Ontario however, the April frosts were destructive in some regions; and from 12 to 34 per cent. of the area sown has been reported as winter-killed. The central counties, north of Lake Ontario, suffered worst, the average loss as reported being 34 per cent. In the Western counties 27 per cent. of the area in crop has been destroyed. In the southern counties, north of Lake Erie, the loss is 10 per cent; in the northern counties and districts 12.6 per cent; and in the eastern counties between the St. Lawrence and Ottawa rivers, 15 per cent. For the whole of Canada the area winter-killed is reported to be 21 per cent, and the per cent condition of the growing crop is 82.

About 12½ per cent. of the clover was heaved out by the spring frosts, and the average condition of hay and clover at the end of April was 89 per cent. Alberta shows better than any other part of Canada, its average being 94½ per cent. Nova Scotia comes next, with 93.75; and in Quebec, Britsih Columbia and Saskatchewan the condition is over 90. In Ontario it is 86 and in Manitoba 85 per cent.

The percentage of total seeding completed at the end of April was 21.35 in Quebec; 44 in Ontario, 47 in Manitoba, 47.30 in Saskatchewan, 66.81 in Alberta and 76.90 in British Columbia. Manitoba and Saskatchewan had 70 per cent of the proposed area of spring wheat sown at the end of April, and Alberta and British Columbia 80 per cent. The Maritime Provinces had scarcely made a beginning of seeding operations at the end of April, and in Quebec barely one-fourth of the spring wheat, oats and barley were sown.

In Ontario 51 per cent of the spring wheat was in the ground, 44 per cent. of the oats and 42½ per cent of the barley.

The report on the condition of live stock is good for all the Provinces—being 95 for horses, 92.43 for milch cows, 90.56 for other cattle, 93.32 for sheep and 94.51 for swine. Alberta is below 90 for horses, Manitoba, Saskatchewan and Alberta for milch cows, Manitoba, Saskatchewan, Alberta and British Columbia for other cattle, and Alberta and British Columbia for sheep; but generally the condition ranges about 90 per cent.—Archibald Blue, Chief Officer.

Hurry, Hurry,

and ask us for prices on Chatham Incubators and Brooders. Our prices are lower than any other standard make in Canada.

J. F. ROACH, "Sunny Side Stock Farm,
Phone 111. Sussex, N. B.

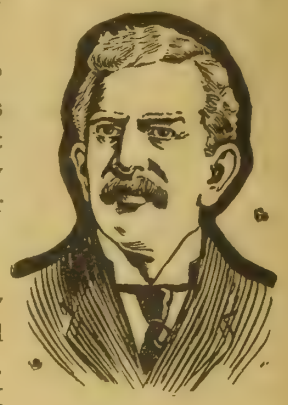
I Wish YOU Were Like Mr. Fraser

I WISH you'd do as he did—for your own good. Like a great many other people he had seen many of our advertisements. Had read some of them, just as you are reading this one. The time came when he was figuring on a new roof and he read one of our advertisements very carefully.

He thought, as maybe you do, that a wood shingle roof was the least expensive, and though not the best nor most durable, was at least "good enough" for him. But our ads. said that Oshawa Steel Shingles cost about the same as wood shingles and were less expensive to put on. That sounded promising.

Further he read that slate cost six times as much, and so-called "ready roofing" cost thirty-three times as much. That Oshawa Steel Shingles were fire-proof, leak-proof, rust-proof, rot-proof, rain-snow-and-wet-proof, need no painting, no patching.

In fact Oshawa Steel Shingles, according to our advertisements, seemed to be everything man could desire in a roof—the absolutely perfect roof. So good that he doubted the truth of our claims. "It sounds too much better than ordinary roofs" he thought. (He'd heard other roofing people talk extravagantly, and thought "Oh, yes, it's easy to talk big, but will the roof make good ?") Then he read my guarantee. That impressed him as being very straightforward, dependable. "If that means all it says: "A perfect roof for 25 years, or a new one free" he thought, "why this advertisement is no idle boast." "By using Oshawa Steel Shingles I settle the roofing question definitely for at least 25 years. If this concern is financially responsible that guarantee seems to cover everything."

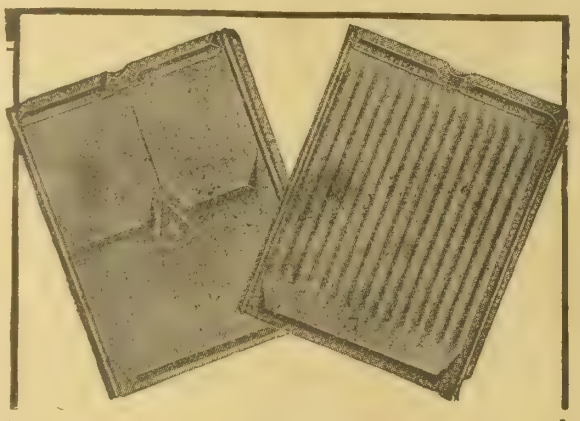


G. A. Pedlar

"Guess I'll send for their booklet anyway and look into the facts a little further." And he did. He got all the facts before deciding. That's where I wish you were like him. I want you to get all the facts about Oshawa Steel Shingles. THEN you can decides. You only fool yourself if you doubt one word I say about our Steel Shingles. You take no risk. My guarantee protects you against disappointment—absolutely. You'd not think of using any other kind of roofing if you actually KNEW how good a roof my Oshawa Steel Shingles make.

How Do You Figure ?

Figure the cost now, material and time, for every kind of roof you know anything about. Oshawa Guaranteed Steel Shingles, you'll find are as cheap to begin with as the poorest wood shingles. It's a fact. Figure the cost per year of each kind of roof. Compare the **estimated** life of other roofs with the **guaranteed** life of Oshawa Steel Shingles, and your figures will show you which is the best and cheapest roof for you to buy.



When I say "Guaranteed for 25 years" I mean it —No "Ifs" About it.

Some makers of metal shingles (notice they don't say "steel") talk boastfully about roofs of theirs which have stood the test for 25 years back. But if you buy their shingles do they positively guarantee to you a perfect roof, no leaks, no rusted holes, no need for paint, no bother whatever, for **the next twenty-five years ?** That is what you are interested in—**yours own roof—not** some other fellow's. Do they ? Pedlar does. You may know people who have lived to be eighty, but that is no guarantee of your life. Oshawa Steel Shingles are the **only kind** that are clearly, positively guaranteed for **any** period.

Here Are Pictures of Two Patterns of Oshawa Steel Shingles (Guaranteed)

They come in squares 10x10 ft.—covering 100 square feet of roof at a cost of only $4.50. They are stamped from heavy sheet steel—28 gauge steel—then galvanized with zinc, so thoroughly that all kinds of weather can't make a rust-hole in them for longer than your lifetime.

PEDLARIZE All Your Buildings, Inside and Out

By "Pedlarizing" I mean doing for the whole building what Oshawa Steel Shingles do for the roof. I make other kinds of sheet metal building materials—for ceilings, side walls, outside—that make your whole building more fire proof, more sanitary, more beautiful, more substantial. You should know about them. May we send you a booklet and pictures that tell the whole story ? It's free. Write for it to-day.

Rain-snow-wind-proof. Fire and lightning proof. No painting, No patching

No bother at all with your Oshawa Shingled roof once it's on your building. Notice we don't merely **say** this. We **guarantee** it, with a guarantee that is legally binding—good for a new roof right up to the last day of the twenty-fifth year. That means it must be absolutely weather-proof. Also it is fire-proof, wind-tight, safe against lightning, and keeps the building warmer in winter and cooler in summer. And you need never worry with repairs. Isn't this the kind of roof you want?

What More Can You Ask of a Roof ?

A roof that is practically one big seamless sheet of tough, galvanized steel, without a crevice or crack anywhere for water or wind to get into, that keeps out the heat of summer and the cold of winter—an absolutely perfect roof for the next twenty-five years. Why should you even consider **any** other kind ? Certainly you should not fail to get **all** the particulars about a roof **like this.** Don't you think so ? Then write for our book—to-day. It is free—from our nearest office.

Write to address nearest you. Ask for "Roofing Right" Booklet No. 17.

25 Year's Use

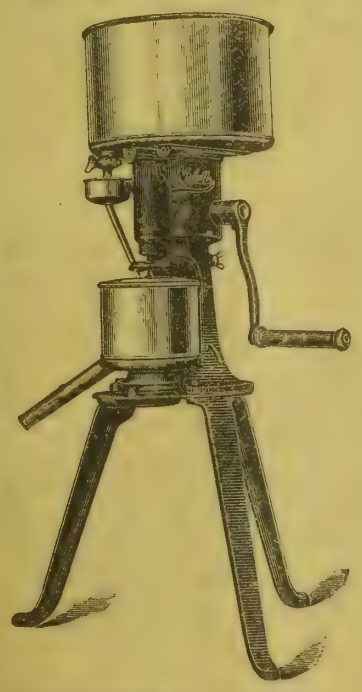
in the Dairies of Half a Million Customers Demonstrates That

THE MELOTTE

is the

MOST EFFICIENT, SERVICEABLE and PROFITABLE

CREAM SEPARATOR ever constructed



Cap. 280-720 lbs. per hour.

The "Melotte" pays its original cost within 12 months from date of purchase in EXTRA CREAM alone and there is NO COST for repairs.

The "Melotte" skims more milk with LESS POWER, in LESS TIME, and, under all conditions MORE EFFECTIVELY than other Cream Separators.

"MELOTTES" are ALWAYS READY to separate. Ask your neighbor to prove this statement.

If you want a Cream Separator, TRY A MELOTTE, then you'll BUY IT and be a SATISFIED USER.

It's a TIME-SAVER, MONEY-EARNER, SATISFACTION-GIVER

ALL THE YEAR ROUND.

MELOTTES are all GUARANTEED to give entire satisfaction, and every machine can be operated before being purchased when in doubt.

Write for NEW RECOMMENDATION BOOKLET which is ALL TRUTH.

YOU Can Furnish Your Home FREE!

ANY housewife buying goods at the stores mentioned below may have their cash purchases apply on **Asepto Soap Premiums.** Every cent you spend counts toward a premium. A sure and mighty convenient way to save without increasing living expenses. Over 300 premiums of honest value to select from. The list will be increased every few weeks. Furniture will be offered next. The old way was to allow premiums to apply on Soap Wrappers only. Now at any of these stores—no matter what you buy—everything has its equivalent in Soap Wrappers. That is every five cents spent counts the same as one wrapper, while purchases of our goods as here advertised entitles you to two coupons—the one the merchant allows and the ones found in or on our goods themselves.

Dr. White's Honey Balm.—A cough syrup that is safe and sure. We are positive that no other cough syrup equals it. Price 25c. Equal to 5 soap wrappers.

Pendleton's Panacea.—The best hot medicine, in use nearly 100 years. Every person knows it is good. Price 25. Equal to 5 soap wrappers.

Brown's Cutilive.—A witch-azel cream for chapped hands, sunburn, etc. Price 25c. Equals 5 soap wrappers.

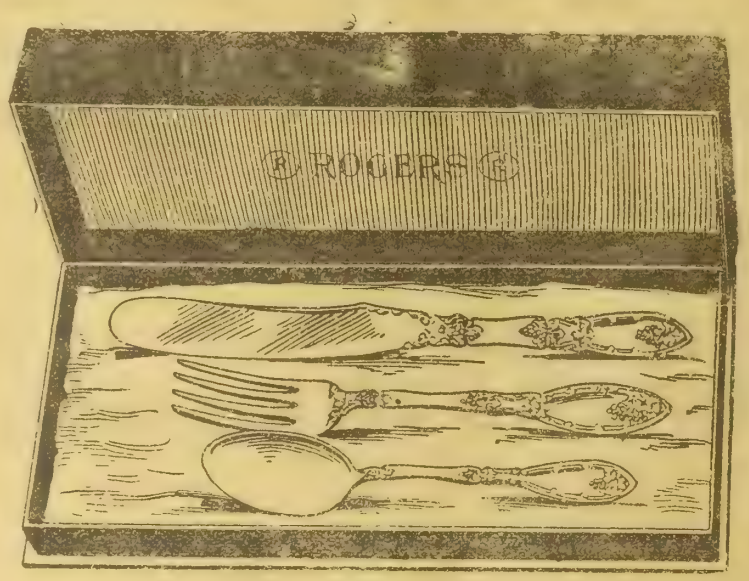
Scott's.—Salts, Senna, Sulphur, Saltpetre, Borax and Alum in 5c packages. Equal to 1 soap wrapper.

Brown's Spearmint Tooth Paste—Sweetens the breath, prevents decay, hardens the gums and whitens the teeth. Price 25c. Equals 5 soap wrappers.

Napatho Soap.—A pure laundry soap, containing naptha and incorporated by a process that prevents it from hurting the hands, as other Napatho Soaps do. The wrappers count for Premiums.

Sapid Tea.—A blend selling at 40c, in 1 lb. packages only. Blended by J. Harvey Brown, one of the most competent tea men in Canada. Each package carries a coupon equal to 8 soap wrappers.

Dr. Scott's White Liniment.—The largest bottle and best liniment. Price 25c. Equal to 5 soap wrappers.



Banner Flavoring Extracts.—All flavors and from 10c to $1.25 per bottle. Coupon on each bottle.

Herner's Dyspepsia Cure.—The only kind that tells you to eat what you like while taking it. Money back if not good. Price 35c. Equal to 7 soap wrappers. Price $1.00. Equal to 20 soap wrappers.

Brown's Stomach and Liver Pills.—A good family pill. Price 25c. Equals 5 soap wrappers.

Scott's Furniture Polish.—Renews the life of old furniture. Price 25c. Equals 5 soap wrappers.

Asepto Soap.—Is equal to the best and contains the same anti septic features that Asepto Soap Powder does. The wrappers count for premiums.

Scott's.—Nitre, Glycerine, Iodine, Iron, Squills, Friar's Balsam, Carbolated Oil, Camphorated Oil, Castor Oil, Sweet Oil, Oil of Tar, Sewing Machine Oil, Spirits of Camphor. Price 10c per bottle. Equal to 2 soap wrappers.

Scott's Fruit Syrups and Lime Juice.—Pure and excellent flavor. 10c, 15c and 25c. Coupon on the bottle.

Ebony Polishes—None better, both paste and lustre. Coupon on each box. Try them.

Banner Spices.—In packages only. Absolutely pure. ¼ lb. packages carry coupon equal to 2 soap wrappers.

Venus Floating Soap.—Made from pure vegetable oils and unexcelled for the toilet and bath. Price 25c. Coupon counts for premiums.

Asepto Soap Powder.—Has been the greatest success of any soap or powder ever put on the market. This is the best evidence of its quality. It is antiseptic as well. It absolutely sterilizes every article washed. Think what this means to a family. Price 5c, and the trade mark counts for premiums.

The following stores are now in a position to explain to you what this offer means :—McLeod & Spence, Port Elgin, N. B.; F. L. Rayworth, Bayfield, N. B.; W. H. Farmers of Quality

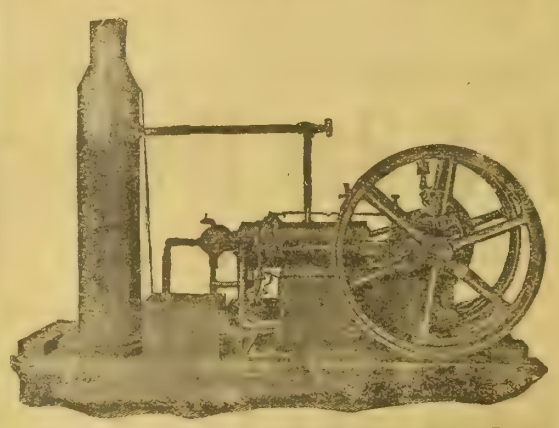
Want Quality!



Stationary and Mounted, in 1 1-2 to 30 Horse Power

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of sealing directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinder head, so that when the valves become worn, the valve cage and valve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

The Use of Kelp and Rock-Weed as a Fertilizer

By the Newfoundland Agricultural Board.

THE following article on "The Use of Kelp and Rock-Weed as a Fertilizer" prepared by the Newfoundland Agricultural Board will prove of interest to all our sea coast farmers, who have been following the practice of collecting these products of the deep for fertilizing purposes. We have often seen the beach in some sections of the Maritime Provinces, in the fall of the year, swarming with men and boys busily engaged in collecting and stacking Kelp to be hauled to their farms as they got the opportunity. We have also seen the fruits of their labors in the bountiful crops harvested from soils on which these fertilizing materials had been applied.

"The Newfoundland Agricultural Board in its researchs to acquire information concerning methods and means employed elsewhere in agricultural operations that could be adapted to aid our efforts in like direction are pleased to find that countries in the forefront of agricultural development such as Great Britain, Germany, Sweden, the United States and France are realizing the worth of kelp and rock weed as a fertilizer and are using it extensively.

"As we all know, kelp and rock weed abound everywhere on our shores, and as a matter of fact have been used by us to a limited extent in certain sections of the country for fertilizing purposes.

"As a rule, however, kelp, when used in Newfoundland has been applied direct to the ground and generally in the spring and for potato crops.

"Where the employment of kelp has been carefully tested as in the countries named, this method of using it is not approved.

"All authorities agree that for growing potatoes, kelp rightly mixed, makes the best possible manure, as it contains a considerable percentage of potash, which is a chief constituent in the growth of potatoes. The United States Department of Agriculture in a recent bulletin, states that a ton of kelp is worth for manuring purposes a dollar and forty-two cents according to present prices of artificial, or chemical manures in that country.

"This means that a ton of kelp would be worth very nearly a dollar and eighty cents in Newfoundland, as artificial manures are dearer here than in the United States.

..."Kelp has an additional value in that it imparts humus freely to the soil. Humus is a very valuable necessary constituent in any soil and with us is chiefly derived from farmyard or stable manure. When a soil is rich in humus it is what we describe as being in "good heart" or "tilth"—in other words it contains decayed vegetable matter that imparts the loamy appearance that we desire to see in soil.

"Kelp, if we may use the term, is a disinfected manure, as it is free from weed seeds, eggs of insects and germs of plant diseases, and in this respect it is to be preferred to farmyard manure. Where the latter is available the bulletin in question recommends its being used on grass and the kelp manure on ploughed land.

"Whilst advocating so strongly the use of kelp as a manure, the authorities do not recommend it being applied direct to the ground in the raw state in spring when used for growing potatoes.

"Kelp, if we may use the term is of a substance called chlorin and this substance is very undesirable in soil, especially in soils where potatoes are grown, as chlorin makes potatoes "wet" and gives them an undesirable flavor.

"This agrees entirely with the reports gathered by the Agricultural Board from enquiries made in this country as to the results from the employment of raw kelp in growing potatoes. It is stated that kelp used raw that is as it comes from the water, gives a fine clear-skinned crop but that potatoes thus grown are less desired for table use than those grown on other manures.

"The information that we now gather as the result of the experiments made by the United States for growing potatoes, when it is pro- and other countries, enables us to strongly recommend the use of kelp perly mixed with the other substances here named, but that when it is not practicable—for want of time or other cause—to mix the kelp with the fish offal and bog and the kelp must be spread on the ground in the fall, for the next year's crop, and dug or ploughed in. The chlorin is thus washed away by the rains and melting snow of the winter and the potatoes of the following year's crop protected from its ill effects.

"It is difficult to overestimate the value to us of this reliable information as to the value of kelp as a manure. It very greatly enlarges the scope of our agricultural possibilities. The world over a goodly supply of manure is the demand of the farmer and the keynote to success in his labors; and this knowledge of the best way of using it assures us of an least possible cost.

Scenes in the Government Illustration Orchard at Riverside, Albert Co., N. B.

abundance of the best manure at the

"Of late we hear a lot of the wonderful results from "intensive" farming—well intensive farming is simply the lavish use of manure. This is plainly shown by the relative yields of wheat per acre in the United States and in Great Britain. In the United States the average yield is only 13½ bushels per acre, whilst in Great Britain the average yield is 30 to 31 bushels.

"This difference is accounted for by the methods pursued in the two countries. In the United States the natural fertility of the soil is being drawn upon to the point of exhaustion, and it is only a question of a few years to the time when the United States, which was looked upon as the world's granary, will be importing food stuffs.

"In Great Britain soil improvement is considered of first importance and in every way possible, by rotation of crops and the free use of manures, its fertility is kept up, as the above quoted yields show.

"Now if manures can give such results we have every reason to be very hopeful of the future, agriculturally—as we have in our kelp, fish

An Old Timer.

Trees of this size and age should be yielding good crops of large clear fruit. Too many, however, are let go wild and their chief function is that of harboring insect and fungous pests. When trees of this kind have been impruned for years, it is better to take three years to them, cutting the wood out as desired.

offal and peat bog, an abundance of the best materials to supply our needs. We only require to bring them together, to properly mix them in the proportions of three loads of finely chopped peat bog to one load of fish offal and one load of kelp, to secure the best possible manure for general farming operations.

"Newfoundlanders are given credit for being a people of great natural intelligence. The recent pronouncement by all the authorities as to the value of kelp would seem to confirm this as we have been using it in parts of the country for a considerable time and have proven its value. Now that the experiments of other countries enable us to use it to greater advantage and to get rid of its one undesirable quality, we have as it were suddenly leaped into the possession of a priceless heritage, as this source of agricultural wealth is verily and literally lying in abundance at every man's door.

TO COMPOST KELP.

"Haul three loads of peat bog or good clay—if peat bog chop it up fine with the edge of a shovel and level it off to a uniform height on this spread a load of kelp and a load of fish heads or caplin. Then begin at one side and turn the entire heap, casting it in a pile of less size and 2½ to 3 feet in height.

"The quantity can be increased in like manner to the extent required.

If squid be used instead of fish heads or caplin half a load will suffice.

"The entire heap should be turned over twice at least before using."

Result of the N. S. A. C. Final Examinations.

Hollow Horn in Cattle.

Editor Maritime Farmer:—

In your issue of April 11th, I noticed an item on what to do for hollow horn. That disease is caused by worms in the tongue of the animal affected. The first symptoms if noted will be a wabbling of the hay in chewing, owing to soreness of the tongue, soon followed by loss of appetite and the breath smelling feverish.

The remedy is simple.

Let one person hold the animal's head steady while another takes hold of the end of the tongue and gently draws it out on one side, drawing it downward over the jaw; this will cause the heads of the little worms to pop up. Then take a dull case-knife and scrape the tongue taking care not to injure the tongue, this will take the heads off, then apply a mixture of pepper and salt to the tongue. In bad cases this may need to be repeated in a day or two.

I have treated a number of cases and have never failed of a speedy cure.—N. P. Whitman, Anna Co., N. S.

The foregoing letter was referred to our veterinary editor, Dr. Standish, and following is his comment:

In compliance with your request I am writing this comment on the so-called hollow-horn trouble. I noticed the clipping "What to do for Hollow-Horn" in the Maritime Farmer, of April 11th, and while it is not wholly correct in some respects, yet it contains sufficiently benefical advice to make it valuable. One mistake is where it says the horn is not hollow. The horns of cattle, when in normal condition, always have a hole or hollow in the bone. It seems strange that so many people suppose the horn solid in health and that when hollow the animal is diseased, particularly when the actual condition can be so easily and cheaply discovered by visiting a slaughter house, when a healthy cow or ox, having perfect horns, is being slaughtered for beef. Shortly after the animal is killed, take a saw and saw through the centre of the horn from the tip to the base when a hollow will be found extending from the skull nearly to the tip of the horn, or shell which is solid from the point backwards for lengths varying from one and a half to four inches. This hollow in the horn continues through the frontal sinuses and nasal chambers communicating with the external air. If any doubt as to this exists, bore a hole into the perfect horn of a healthy animal and inject colored luke warm water and you will find it escape by the nose, providing the hole is bored to the centre of the horn and sufficient colored water is injected. Hollow horn, as a disease, is imaginary, a myth.

I have known ignorant veterinary pretenders to claim many diseases to be hollow horn. Many cases of pneumonia, catarrh, diseases of the digestive system, once in the case of a cow, the property of the late Judge Kingsmill, that had swallowed a ladies hair pin, the points of which had passed through the walls of the stomach, another, a bull, the property of Cargill and Son, that had a darning needle imbedded in his liver, post mortem examination revealed these conditions. A cow with a piece of wire penetrating her jaw the removal of which remedied the disease and many other diseases were said to be hollow horn.

A favorite quack theory is that a grub gets into the end of the tail and works its way through the hole in the bones of the tail and back bone to the head, there causing the hollow horn; but as there is not a hole in the tail bones of cattle, nor is there ever found a grub in the tail, unless the switch at the end of the tail becomes so filthy that the fly deposits eggs there and maggots develop, which is very rare, the supposed worm that is discovered when the tail is split is the termination of the tail bones, a white ligamentous substance which is mistaken for a worm. A careful examination will reveal the mistake.

As to the theory of worms in the tongue, which I heard advanced once at Lawrencetown, N. S., it is as ridiculous as any, and on my saying I had never heard of the like, let alone seeing it the advocate of the condition said he had several suffering at the time which he would show me. I drove to his place only to discover they all had recovered and he could not show me the worm— another case of not recognizing the normal popilla of the tongue, which are large on cattle's tongues. As there is no such disease as hollow horn of cattle, treatment is out of the question. When an animal is diseased, the best thing to do is to discover what the disease is and remedy it. To enable a person to diagnose diseases it is necessary for them to be familiar with the healthy condition and if as you say in your issue of Aprill 11th, "Treat by destroying lice if present, attending and toning the system when necessary, which will be seldom, if good food, water, exercise and stabling be given the horns, tail and tongue may be allowed to care for themselves.

Correction.

Editor Maritime Farmer:—

In your issue of April 11th, I see the results of the Prince Edward Island Dairy Herd Competition given by John Anderson, the Secretary.

I wish to call your attention to the place I am given in the Queens Co. competition. The number of cows given for my herd is correct, and the amount of milk is correct, but the average for my herd is wrong to the ?xtent of just 1000 lbs. Instead of 2558.1 lbs. the average per cow, should be 3558.1 lbs. I should have third prize in place of fourth, as given in your paper of the 11th. I can scarcely understand how Mr. Anderson make this mistake. The difference in the prize is only trifling, but it makes a big difference in the showing of my herd, and also in the average for the county. I trust in your next issue of the Farmer you will make the correction. Certainly my average is low, but when you know that four of my cows were heifers, two two-years-old, and two three-year old, two freshened 15th June an two 1st July, and one, an old cow, 14 years old, and 13 months in milk before the first of June when the competition opened, it does not look so bad.—D. N. McKay, Springfield, P, E. I.

Poor Food a Cruelty to Animals.

Editor Maritime Farmer:—

I am sending you one dollar to pay one year's subscription to the Maritime Farmer. I am much pleased

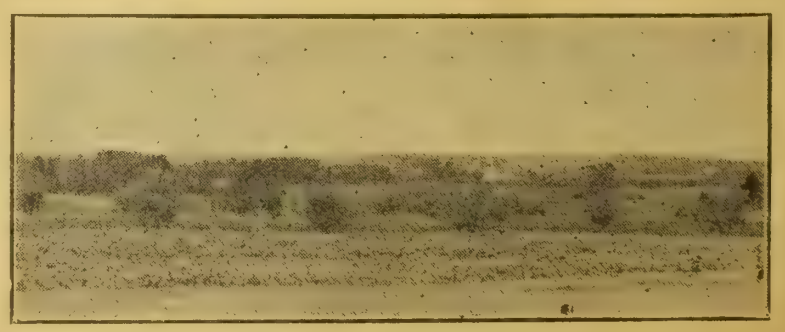

Illustration orchard on farm of Col. T. L. Alexander, Fredericton Junction, N. B. Three years set. Note uniform growth of the trees and the splendid crop indicating excellent care.

Seven Year Old Yellow Transparent Tree at Baltimore, Albert Co., N.B.

with the informntion I receive from your paper.

I am agent for the society for the Prevention of Cruelty to Animals. Our duty is to prevent cruelty to animals. The want of proper care in curing the food for our dumb animals is one form of cruelty that should be avoided as much as possible. If people had to eat the food our animals are fed, it would be prepared with greater care. I believe our hay is not, as a rule, cut young enough. I farm a few acres, and my cows are eating young cut hay. They fill themselves and are in good order. When I used to farm more extensively, we never got our hay in as a rule any too early, and nearly always some, or a large part of it was too late in cutting. It would be better if more people would commence earlier, especially if the weather is fine. My experience was that if there was much white top it was better to cut that very early, when in bloom. If conditions are favorable, don't go to the back fields, where the grass is light and you have a long, but cut the best that you have, especially if the weather is fine. You can get three times as much hay if handy and good. I am referring especially to up-land farms, but it will apply as a rule, to low-land farms and even to marshes. The whole business, in my opinion, is cut too late.

I have had some experience on all kinds of land in the past. You may say, "my grass is growing." Yes, that may be, but before you get through with it, it will be losing in quality. Since leaving the farm and coming to town and having to buy my hay, I find that sometimes it is about all it is worth to give it barn room. Instead of the leaves being green and pliable it is black and dry. Last year I rented a field for a few years so as to get some good hay for my horse and cow. We should be careful to give our dumb animals the best food we can, by preserving the food in the best possible condition. We should feed our mother earth very liberally and it is a big mistake for farmers or farmer's wives to sell the ashes for a little poor soap, when they can be put back in the soil to better advantage.—Rev. B. Colpitts, Carleton Co., N. B.

Alfalfa and Buckwheat.

Editor Maritime Farmer:—

Two years ago I sowed one row of alfalfa and it done well last year. I did not dig any up to see if there were nodules on the roots. Last year I sowed two acres of oats and seeded it down with alfalfa. When I cut the oats it looked yellow but by fall it got its color. I top dressed it in the fall with good barnyard manure. I don't know how it will do. Later on I will let you know.

If I was going to sow it again I would not sow a nurse crop with it and then I would plow a piece of clover sod down about the 20th of June, and manure it well. I would harrow it once a week until the 12th of July, then sow it with culture. I would not cut the first crop, but leave it on all winter as it would keep it warm.

I had 15 acres of poor land that had given a very poor crop the year before. Last year I plowed it about the 15th June then it came in wet and I did not get my buckwheat in until the 1st July. I used grain fertilizer and a seeder to sow it. I mixed one bushel grain and 100 lbs. of fertilizer together and put it in a seeder and started to sow it, but failed as the seeder would not sow it properly. I got discouraged and took it out of the seeder and sowed one acre without fertilizer and had five bushels of buckwheat on that one acre. At tea time I took the seeder into my shop and made an arrangement inside the box to shake grain and fertilizer down. I sowed 14 bus. grain and 14 bags, holding 1400 lbs.

Tree Top-grafted to Gravenstein on Farm of S. L. Peters, Queenstown, N.B. Note where Scions were inserted and desirable head produced.

of fertilizer through seeder in drills, and in the fall I had 380 bus. grain which I thought paid me all right. I gave $1.50 per bag for the fertilizer. After I got through sowing I had 12 bags left. I sowed it on one-half of the field by hand and a boy harrowed it in. The grain on the latter piece was no better but grass seed took better. I may get a better crop of hay. If you would like to know, I will let you know in July, if nothing happens. I think if there was more of this kind of work done there would be less heavy feed imported and drawing money out of the place.—W. M. Starkey, Starkey's, N. B.

Preparing for the 1911 Winter Fair.

A meeting of the Directors of the Maritime Stock Breeders' Association was held in their office in the Winter Fair Building, Amherst, N. S., on the evening of June 8th.

Lieut.-Col. H. Montgomery-of the Association occupied the chair and a great deal of routine business in connection with the Winter Fair and Horse Show was discussed. The other members of the executive, who were present were: F. L. Fuller, C. A. Archibald, R. S. Starr, W. W. Black, S. A. Logan, Jas. F. Roper, Gavin Harding, Albert Boswell, Jr.; B. M. Fawcett and M. H. Parlee.

Secretary Fuller read the Financial Statement of the recent Horse Show and on motion it was unanimously adopted.

The committees appointed to interview the respective Local and Federal Governments re increased grants for the Horse Show and Winter Fair reported progress. The final outcome of their solicitations will be announced later.

It was decided to hold the 1911 Maritime Winter Fair on December 4th, 5th, 6th and 7th. The prize list will be practically the same as last year. A section for "Heifer, 1 year old" has been added to each one of the dairy classes and prizes of $12.00 $8.00, $6.00 and $4.00 are offered in first, second, third and fourth places.

The Silver Cup donated by Hon. Wm. Pugsley, Minister of Public Works, for the best grade beef animal, which was won outright last year by Mr. W. W. Black, is again generously offered by the winner for competition. It was decided not to rent the poultry coops to other poultry associations.

The following rules have been amended to read as follows:

Rule 8. All animals must be the bona fide property of the exhibitor from the date of entry. If required by the management an affidavit to that effect must be made.

Rule 11 is discarded and

Rule 10 now reads: Arrangements will, if possible, be made to have a stated interval elapse between the feeding and killing of animals shown in the block test, and only animals duly entered for such test will be slaughtered.

Rule 18. All animals except those exhibited in the dairy classes shall be judged from a breeder's, feeder's and consumer's standpoint and the awards so placed.

The town of Amherst, having generously voted a sum of $1,500 towards extensions and alterations to the Winter Fair Building, a new dairy wing will be erected to give ample and appropriate quarters for the ever popular dairy test. The slaughtering room and cold storage section will also be remodelled.

The executive are ready to receive donations of cash, silver cups and other goods for special prizes in the respective classes. What can you Mr. Reader, do to swell the list of Special Prizes?

Field Crops in Canada.

A Bulletin of the Census and Statistics Office issued on June 10th states that the season this year has been favorable for field crops in all parts of Canada, and excellent reports have been received from all the provinces. The lowest percentage of condition is made for fall wheat, which suffered from in adequate protection in the winter months, and also to some extent from spring frosts. The areas of fall wheat are greater than last year by 4.50 per cent. and of spring wheat by 13.70 per cent. total area in wheat is 10,503,400 acres, as compared with 9,294,800 in 1910 and 7,750,400 in 1909. The per cent condition of fall wheat at the end of May was 80.63, and of spring wheat 96.69. The area in oats is 10,279,800 acres and its condition 94.76, as compared with 9,864,100 acres and 93.95 per cent condition last year. Barley and rye each show a small decrease in area, but the condition is higher than at the same period last year. Slight decreases are also seported for areas of peas, mixed grain and hay and clover, with per cent. condition of over 90. Hay and clover have a reported condition of 91.45 for the Dominion, being practically 100 in Manitoba, Saskatchewan and Alberta. The area of the field crops named is 32,051,500 acres in 1911, compared with 30,554,200 acres for 1910 and 28,194,900 acres for 1909. In the provinces of Manitoba, Saskatchewan, and Alberta the area in wheat, oats and barley was 3,491,413 acres in 1900, 6,009,389 acres in 1905, 11,952,000 acres in 1909 and 13,809,300 acres in 1910, and it is 15,355,500 acres this year. The increase of these crops from 1900 to 1911 was 2,663,699 acres in Manitoba, 7,364,315 acres in Saskatchewan and 1,836,073 acres in Alberta.—Archibald Blue, Chief Officer.

Treatment for Unthrifty Horses.

J. D. McR., P. E. I.:—Please advise through the columns of your journal treatment for four-year-old horse that is well fed, but looks unthrifty. He passed a few worms about 12 inches long and as large as a lead pencil.

Ans.—Give one dram each of powdered Nux Vomica, Genitan and Sullphate of Iron, night and morning in food or as a drench in water for one week. Then give only bran mash and water for 12 hours after which give as a drench one pint of raw linseed oil and one ounce of oil of turpentine well mixed. Feed only bran mashes and give water frequently for twenty hours after giving the oil. Then give the powder advised above once a day, and one ounce of Fowler's solution of Arsenic, once a day for a week. Give the powders at night and the Arsenic in the morning.—J. Standish, V. S.

Top-grafting, Second year of growth. Too much of the original tree was cut away at one time leaving the new scions to take too much sap flow, tending to a rapid slender growth, which is very liable to break off with the wind.

THE MARITIME FARMER

And Co-operative Dairyman.

Semi-Monthly Journal devoted to the interests of the farmers of the Maritime Provinces.

Official Organ of The Farmers, and Dairymen's Association of New Brunswick; The Nova Scotia Farmers' Association The Nova Scotia and P. E. Island Fruit Growers' Associations The New Brunswick Fruit Growers' Association; The Maritime Stock Breeders' Association; The Maritime Bee-Keepers Association, and The New Brunswick Poultry Association.

Subscription Price $1.00 per year. When paid in advance 80 cts. Persons taking advantage of the 80 cent rate when subscribing are only entitled to it by paying in advance each year. When subscription gets in arrears, $1.00 per year will be charged. Subscribers are requested to bear this in mind. This paper is sent to subscribers unless a definite order for dis. continuance is given.

The date after your name on the little green label on front Page is, in every case, the time to which your subscription is paid.

OUR GUARANTEE.—With each subscriber to the MARITIME FARMER, we positively guarantee, while his subscription lasts, that no advertisement is allowed in our columns unless we believe that any subscriber can safely do business with the advertiser, and we agree to make good any loss which any such subscriber may sustain by trusting any such advertiser who may prove to be a deliberate swindler; but we do not undertake to adjust trifling differences between subscribers and responsible advertisers. To take advantage of this guarantee, written complaint must be made to the publisher within one week from the date of any unsatisfactory transaction, with proof of the swindle and loss, and within one month from the date when the advertisement appeared, and the subscriber must prove that in writing to the advertiser be said :—**"I saw" your adv. in the MARITIME FARMER.**

Photographs of farm life, when accepted, will be paid for at the rate of 50 cents each, Communications on all subjects connected with farming and stock-breeding are invited. The publishers will pay a reasonable rate for matter of practical value and for agricultural news. Photos and matter not accepted will be returned on receipt of postage.

RATES FOR CASUAL ADVERTISEMENTS.

VALUE OF MOISTURE.

The most ignorant farmer knows that a certain amount of moisture is absolutely necessary for the growing of crops, but what that amount is none of us have more than vague ideas. We all know that too much moisture will prevent growth and maturity of most kinds of vegetation, and that too little will have as serious effects. To overcome the effects of too much moisture, the farmer practices drainage if he has studied the subject, but it is only in very recent years that the agriculturist has attempted in a scientific way to overcome the effects of a lack of moisture in the soil in any other way than the artificial method of supplying that lack by irrigation.

Now, however, the scientific agriculturist—and every agriculturist must now be a scientist—is putting to practical use the knowledge that the soil absorbes moisture very tenaciously; that it can be kept from evaporation by the proper treatment of the surface of the soil.

Observation first made it known to the farmer that continued shallow cultivation in the time of a drouth would keep a crop green and growing when other fields without it would dry up and refuse to produce anything. This resulted in the experiments and investigation which demonstrated the practical moisture conserving possibilities of the dirt mulch, for that is just what shallow cultivation makes. This mulch, acting as any other kind of a mulch would, will keep the moisture in the soil from escaping and divert it to the roots of the growing crops.

The practical value and the actual results of this kind of cultivation have often been seen in fields of growing crops located on adjoining farms. In the one field the thorough going farmer has given continued and thorough cultivation throughout the dry summer. He has not put away his cultivators and hoes simply because the weeds have been cut down and the dry weather does not encourage them to grow again. He recognizes the fact that conditions which are discouraging to the growth of weeds must be still more discouraging to the growth of the vegetable or grain crop from which he desires results, and he continues to encourage the soil to do its best, for he knows there is a large amount of common sense behind the old joke about tickling the ground with a hoe. The result is that his ground continues to smile with the green promises of a harvest when his neighbor's ground shows only the parched and somber features of a pessimist.

This particular theory of farming is no longer simply a theory. Every progressive farmer who has made any study of the question knows that treatment of that sort will give results, and it is the secret—an open secret—of the large crops which we a few years ago would have called phenomenal. After all, they are still phenomenal, perhaps, for it is only a small minority even in these days who are growing anything like the amount of crops which the land is able to bear, and to bear easily.

The problem of the conservation of moisture is not really a problem; it is in these days almost an exact science, the practice of which will, should and does bring with a great deal of certainty the results aimed at, and the principles of which may be known and applied.

BRAINS AND THE COUNTRYMAN.

The townsman has often a very confused idea of the intelligence of the farmer, and criticises in ignorance farming operations which he does not understand.

To the average person life on a farm has many attractions. It is without doubt the most healthy life a man can find; and as to its advantages to the nation, a moment's consideration will suffice to show that farming is our greatest national industry, and on its success and prosperty depends the comfort of many millions of people.

The farmer is one of the few real producers. In addition to producing food for man and beast, farm life produces men—such food and such men as our country needs.

The farmer's business actually calls for many qualifications in a man. He must be scientific nowadays, and cultivate his fields on scientific principles; he must understand machinery and be something of a mechanic, as farming machinery is every year becoming more costly and varied. It goes without saying that he must understand stock of all kinds, their ailments and how to treat them in times of urgency; he must organise his work so as to get the best results from his land and his workpeople, and he must also be a man of business and a man of some means. He does a good deal of buying and selling; has to know what he is doing when he calls on the local bank manager, and it is well for him if he is a good book-keeper and accountant—able to show by his farm books which fields, which crops, and which flocks and herds have paid him best.

Surely few businesses call for more all-round ability and never-flagging energy than that of the farmer.

THE EVIL OF WASTED EFFORT.

The poet, Walt Whitman, gives us in a single line, an understanding of the meaning and scope of evil:

"Nothing out of its place is good; nothing in its place is bad."

Here we can see as at a glance that what we call evil in this world comes from a perversion of good, the right thing in the wrong place. Brought down to the common affairs of life, to the business of the farm, how true it is. Good work at the wrong time means wasted labor. Poor tools in place of right ones means wasted labor.

A lack of order, carelessness, a place for everything and everything out of place, means wasted labor Live stock of a kind not fitted to the purpose of the farm means wasted labor. A poorly informed mind not knowing, and maybe not caring to know, the real meaning of the forces that it is dealing with means wasted labor. Badly constructed buildings where animals are forced to live in an unhealthy, unsanitary condition means wasted labor.

And so out of this enormous sum of wasted labor, ignorance in place of knowledge, comes the growing evils of a wasted soil, wasted opportunities and finally a wasted life, with but little to repay for the long years of toil it has cost.

It all comes back to things out of place. A lack of fitness. What a triumph of mind over matters, of human accomplishment, it is to be able to establish on the farm an assemblage of right things in their right places. A good word should be spoken for the humblest farmer who strives to this end.

THE WEED CROP.

Did you ever stop to think of the tax you are paying to keep up the weed crop? If the state should levy a tax on your crops, equal to 25 per cent of the value, you would rebel in righteous indignation. Wouldn't you? Yet a good many of us permit a stand of 25 per cent of weeds to occupy our fields and think we are doing pretty good farming, too.

Why not grow grain or some other good crop where that weed tax is now growing. The weed gives no return. They draw more heavily on the water supply and plant food supply than paying crops. Paying crops and weeds cannot occupy land at the same time. Let us grow paying crops and get profits, rather than pay taxes.

Pound for pound, the plant food required by crops and by weeds is almost the same, but weeds are better food gatherers. The greatest difference comes when the question of water arises. Weeds not only require more water, but are able to get it. From 300 to 700 pounds of water are used in producing a pound of dry matter in our common crops. Weeds require even more. If it comes to a contest as to which will get it, the weeds win every time.

They are the real children of the soil, the crop's usurpers, and backed by the right of inheritance they make a determined fight, which we are sorry to see so often won by them.

TO SOW AND TO REAP A NATURAL INSTINCT.

We hardly know a city man who is not longing during this siren season to have at any rate a little garden or some trifling section of fertile land in which he can plant things and nurse them and see them grow. This desire to cultivate the soil and act as nurse and protector to some living growth is as natural in man as the instinct of maternity in woman. It shows that the roots of the human race are struck deep in the loam. Women are more eager to minister to the wants of a flower bed or to something ornamental and fit for the "front yard"; but man would rather, in his natural state rear something which can be garnered in the autumn and stored away in the cellar against the empty days of winter. It is his instinct to provide for the household; and he likes to do it, even when it costs him a hundred dollars in "made earth" and hired labor and fancy seeds to do ten dollars worth of providing. The farmer has the primal joy of being engaged in an occupation which satisfies one of the strongest hereditary passions of the race.

How Can Alfalfa Growing Receive a Boost in the Maritime Provinces?

Where to Grow Alfalfa.

Where will alfalfa grow and how should it be started? Alfalfa will grow on any good soil that is well drianed; in sand it will not do so well, and hard pan interferes with its root growth. Standing water is death to it. When starting alfalfa it must be kept in mind that alfalfa has bacteria living in nodules on its roots. These germs furnish the plant with nitrogen which they take from the soil and air. They put it into the form that the plant can use and so supply the alfalfa with the nitrogen that it needs and more too. The alfalfa plant has in a measure lost the power of taking nitrogen from the soil as the other crops do, so it can not make much growth alone. It in turn furnishes the germs with food of a different kind so it is a co-operative affair, each furnishing that which it can secure easiest. When the alfalfa is starting it does not have the germs on its roots and so is very delicate and must be given good care. The germs will multiply faster in the soil if it contains manure, and if the germs are not in the soil it may be necessary to introduce them. The best way to do that is to get some soil from a field that has been growing the alfalfa successfully for a few years and sow it on the new field at the rate of 200 pounds per acre.—N. D. Extension Bulletin.

Alfalfa in Favor.

Although alfalfa has been before Ontario farmers for many years it has not been taken advantage of and grown generally. Many of the older men who attempted to grow alfalfa 25 and 30 years ago did not succeed any too well with the crop. At that time the needs of alfalfa were not well understood. It was -not known that bacteria was required for the alfalfa roots before the plants would grow their best. It was not recognized that alfalfa would appreciate a dry, deep, rich soil and that lime and manure added greatly to the yield of alfalfa. Methods of curing were at fault and the alfalfa was allowed to get too ripe. It became too woody and the leaves dropped off, leaving coarse, woody stalks, which did not make the best of feed.

During the past few years a great number of progressive farmers in various parts of Ontario have experimented with small acerages of alfalfa. It is hard to find one of these men who has grown alfalfa on suitable soil and has grown it according to the modern, approved methods of culture but has been successful with alfalfa and now wishes he had more of it. Hundreds of these farmers are planning to see increased acerages to alfalfa this spring. Alfalfa has proved itself to be a money crop beyond preadventure. There is no reason why each and every farmer should not grow at least a reasonable acerage of alfalfa.—C. C. C.

What Alfalfa Will do for Hog Raising Industry.

Alfalfa will give better results for hog grazing purposes than any other forage known. It is a nitrogenous forage, rich in protein and calcium, and therefore furnishes the necessary protein and mineral matter for the highest development of bone and muscle. It is a very excellent early forage, since it begins growth early in spring. When supplemented with corn to the extent of one-half of a full ration or to the extent of 2 per cent of the weight of the hogs, the best results are obtained. When alfalfa is fed alone it is about equal to a maintenance ration; so when corn is fed with it every pound fed will be used for the production of gain. Alfalfa and corn, we believe, will produce a greater net profit to the farmer than any other combination known.

Under ordinary conditions alfalfa will forage from ten to twenty shoats per acre. A new seed should be pastured very lightly the first season. No larger number than ten shoats per acre or one sow and her litter should be used. After the first season as high as twenty head per acre or two sows and their litters may be pastured on it throughout the season. In any event, it should not be pastured so closely that no woody growth will take place. A very good rule to go by is not to pasture it so closely but that one cutting of hay may be taken off in the forepart of the season.

Alfalfa for Sheep.

All sheep love alfalfa, either green or dry. The very nature af the animal makes alfalfa a suitable food for it. Sheep need foods rich in protein. It takes such food to make good wool, red flesh, bone, milk. Sheep are usually young and growing or else are ewes giving milk or pregnant and developing within their bodies unborn lambs. Growth calls for protein. Milk calls for protein. Wool calls for protein. The protein requirements of the sheep is greater than with the cow. This much for theory.

The practical part of it is that experience has shown that sheep dearly love alfalfa, green or dry, and thrive exceedingly on it. In fact, it is hard to make profit in America in sheep farming unless one has alfalfa hay to fall back on. The best shepherds are provided with it. It is fed during winter time in the sheep folds; ewes were on a diet of alfalfa hay; they suckle their lambs with milk made chiefly from alfalfa; they go sometimes to pasture composed of a mixture of grasses and alfalfa; the lambs are fattened on alfalfa hay and grain. The sheep industry in America with alfalfa taken away would almost collapse. Millions of sheep are fattened mainly on alfalfa hay. It is the very foundation stone of the industry.

The secret of successful grazing of sheep on alfalfa setms to lie in following a few well defined rules. First, the alfalfa ought to be fairly well grown. It is much better if it is near the blooming stage when they are turned into it. It is a decided mistake to turn them into a field in early spring to gnaw off buds from the crowns as they start to grow. That is a practice bad for the alfalfa and not very helpful to the sheep.

Second, the sheep should be filled up full of green feed before being turned in on the alfalfa. If, in addition, they are given some dry grain, provided they are accustomed to this all the better. They should be turned in at about ten or eleven o'clock in the morning of a sunny day.

Third, they should have salt before them at all times. It is thought that it is better to mix with this salt air slacked lime about two parts of lime to one of salt.

Liming Soils for Alfalfa.

To what extent Indiana soils are in need of liming in order to successfully produce alfalfa is not definitely known. It is known, however, that alfalfa will not thrive in soils that are sour and that there are many such in the state. In some of the experiments conducted during the last few years, liming has been found to increase the yields of alfalfa, while in other cases the lime produced no apparent effect.

Soils that produce good crops of clover will probably not be seriously in need of liming for alfalfa. On the other hand, where there is trouble in getting a stand of clover, or where this crop does not otherwise succeed well, it will usually pay to lime the soil, and liming may be actually necessary before alfalfa will do well, because the alfalfa bacteria will not thrive in acid soils.

In the case of soils that are sour because of lack of drainage, liming alone will not be sufficient. Drainage must receive first attention. The soil must also be otherwise put into good physical condition by proper tillage methods, the addition of humus, etc. After these things have been attended to, if the soil is in need of lime this substance can do its work properly.

The most satisfactory method of determining whether or not a soil is in need of liming, is to make a small trial application of lime on a patch sown with alfalfa, some time before seeding the whole field. Such an experiment may result in saving the expense of liming and is well worth making, where there is serious doubt, because in many instances there is a sufficient natural supply of lime in the soil. In some portions of the state where there is an abundance of limestone, the soils may, nevertheless, respond to applications of lime because they bear no direct relation to the rock upon which they rest.

Where liming is necessary, an application of ground limestone will usually be most economical, although other forms of lime will give equally good results. The amount that should be applied will depend upon the needs of the soil, but probably not less than two tons of ground limestone per acre should be used, and double this amount may be profitable. It may be applied at any time but the longer before sowing the alfalfa the better. It is a good plan to begin preparing the ground for alfalfa a year or so in advance and in that case the lime may be applied when preparing the soil for the preceding crop. If the ground for alfalfa is to be plowed in the fall, the lime may be applied at that time. In spring preparation, the lime should be applied immediately after plowing and disked into the soil so as to give it as much time to act as possible before seeding.

The Time to Sow Alfalfa.

If the weather conditions are favorable and the soil is in good condition and free of weed seeds, it does not seem to make any important difference when the seed is sown so long as there is sufficient time for the young plants to thoroughly establish themselves before winter, and good results may be secured at any time from April to August. Trouble with weeds is most likely to arise the earlier seeding, while with the later seeding there is liable to be an insufficient supply of moisture in the soil to permit of proper soil preparation, and the germination of the seed and the development of the plants may be seriously delayed by periods of drought. In the Experiment Station's trials with late summer seeding during the last five years, periods of drought have been occasionally encountered in different parts of the state, which have more or less seriously interfered with getting a satisfactory stand or a sufficient amount of growth before winter to insure success, it therefore seems wisest to sow somewhat earlier. Seedings made in April or May, on the other hand, are so liable to be troubled with weeds that such early seeding is not advisable, even with the use of a nurse crop, unless the ground is known to be free of weed seeds. On this point we would especially caution farmers, as few realize how full of weed seeds the soil really is. Trouble with weeds has caused more alfalfa failures than any other one thing.

On account of the danger of trouble with weeds in spring seeding and the liability of interference by drought in late summer seeding, it is undoubtedly safest and best, where it can be done, to spend the spring in ridding the ground of weed seeds and then sow the alfalfa alone about the end of June or early in July. In this case the ground should be plowed in the spring, turning under some manure if possible and then harrowed every 10 days or two weeks until seeding time. Each successive harrowing will kill the weeds that have started and put a fresh lot of seeds in position to germinate until, finally, all weed seeds near enough to the surface to grow will be sprouted and killed.

When spring seeding is to be practiced, a light seeding of oats or beardless barley, about a bushel and a half per acre, may be used as a nurse crop. This nurse crop should usually be cut for hay soon after heading and removed from the field. With summer seeding a nurse crop should not be used.

Preparing the Seed-Bed and Killing Weeds.

Preparation of the soil for alfalfa should usually be begun with the preceding crop, applying any needed lime at that time. What the preceding crop is does not seem to be important so long as it will permit of thorough soil preparation for the alfalfa. A corn crop which can be given a clean culture will usually be best, though for summer seeding any spring sown crop which can be removed early in the summer may be used. Early potatoes, peas for canning, clover and small grain crops can all be used to precede summer sowing. In any case, a fine, mellow seed-bed with a firm sub-face should be prepared and weed seeds killed by repeated harrowing. Extra deep plowing is not advisable. Where alfalfa is to follow peas or early potatoes, a good seed-bed can usually be prepared without plowing.

Cutting for Hay.

When alfalfa is used for hay it should be cut whenever the new shoots at the crowns of the plants are well started. This is a better guide as to the proper time of cutting than the appearance of blossoms. Whenever the tops turn yellow, or the leaves become seriously affected by "leaf spot" it should also be cut, even though the fresh shoots have not started.

Flavor

in tea must be distinctive, pleasing and unvarying to merit continuous use. The flavor of Red Rose Tea is all its own; and it never fails to win and hold approval because it never fails in quality. Try it.

92

RED ROSE TEA "is good tea"

HORTICULTURE

To Transplant a Tree.

When trees die after planting it is usually due to carelessness in transplanting. Some kinds of trees transplant much easier than others and some of those that are planted more commonly than others, such as the hard maple and American elm, are among the easiest to transplant, hence one is likely to become careless through success with these. Trees and shrubs should be dug as carefully as possible so as to retain a large proportion of the roots. The more roots there are the surer one is of getting the tree to live. The roots should not be allowed to become dry from the time of digging until the trees are in the ground again. They must be prevented from drying in transit by protecting them with wet moss or wet sacking. If the roots of evergreens, especially pines, become dry even for a short time the trees are almost sure to die. When planting, a hole should be dug large enough so that the roots may be spread out and not crowded or doubled up, and deep enough so that the tree or shrub will be from one to two inches deeper than it was in the woods or nursery. By planting a little deeper than it was before, provision will be made for a little heaving which often takes place the first winter, but planting too deep is almost as bad as planting too shallow. It is important to have the tree at least as deep as it was before digging and, as stated, best to have it a little deeper. The soil when thrown out of the hole should be put in two separate heaps, the surface or good soil in one and the subsoil in another. If the soil is all poor, to get the best results some good soil should be brought to at least partially fill the hole. The tree is now placed in an upright position and the good soil is first thrown gently back about the roots of the tree. As it is important for the soil to come in close contact with the roots it should be trod firmly down with the foot, when thrown in. If there is not enough good soil available to fill the hole the poorer soil may be placed on top of the good. Manure should not be put in the hole with the soil as it may burn the roots and make the soil so loose that it will dry out easily. Better apply the manure to the surface of the ground in the autumn and dig in the shortest of it the following spring into the surface soil. After planting the tree or shrub should be cut back well, the amount of heading in depending upon the amount of roots on the tree. If a large proportion of the roots are cut off a large proportion of the top should be removed, otherwise the large leaf surface will transpire so much moisture that the tree will dry up before the roots begin to take in more. This is why shade trees are cut back so severely when planted, but it is not necessary to reduce the trees to mere poles as is to frequently done, causing a bad crotch in the tree later on where the stub dies back and where rot is likely to get in.

Evergreens are not headed back like deciduous trees as it would disfigure them too much and they have usually a fair supply of roots.

Before leaving the tree the surface soil should be loosened again so as to leave a thin mulch of loose soil on top which will prevent the moisture evaporating as rapidly as it would do if the ground were left hard. The surface soil should be kept loose throughout the summer and the best growth will be obtained by keeping a circle of from two to three feet or more in diameter around the tree free of grass and weeds, where the soil will be kept loose and where the rain and air may find a readylentrance. If trees and shrubs are transplanted with care they should usually live. Eearly in the spring is the best time to transplant most kinds of trees and shrubs, evergreens included. Evergreens may be transplanted in summer, but greater precautions must be taken to do it successfully and it is not recommended. Both evergreens and deciduous trees may also be planted in the autumn successfully, but on the whole they do not do so well as if planted in the spring.—W. F. Macoun, Horticulturist, Central Experimental Farm.

How to Diagnose Orchard Troubles

In order that we may understand the effects of disease and the relations between diseases and their symptoms, it will be necessary to consider first the normal course of events in a healthy plant. A plant lives its life in constant change, in response to the surroundings in which it happens to be placed. If the weather is warm enough, the absortion of water and the other life process of the plant, will go on in one way, and if the weather becomes cooler, they will be modified to suit the conditions. Let us suppose that all the outside conditions are best possible, and that the plant is living along healthily, its life pocesses will include the following things, stated very briefly. The very youngest smallest roots absorb water from the soil, and along with this water they take up certain mineral plant food substances. This crude sap, as we may call it, is carried upward by the root and stem to the leaves. In the leaves, most of the water is given off by evaporation, even as large a quantity as a quart of water in a day from a single medium-size plant of corn. The mineral substances that were in the sap, are worked over by the leaves into plant food. They are worked over by the addition of carbonaceous matter from the air and this plant food is distributed to all parts of the plant and used in the growth of new parts. In due time the plant blossoms and blossoms are pollinated, and fruit is set and seed produced. All of these processes, the absorption of water and mineral substance, the working over of the crude material into plant food, the growing of new parts in the plant, and the blossoming and production of fruit, are carried on in relation to the external conditions.

Let us suppose that the plants have had their roots injured, or perhaps they are in a soil that is too cold and wet for their proper growth; then it comes about that they cannot absorb properly the water and plant food from the soil. There is not enough mineral matter carried to the leaves. The leaves may be doing the best they can, but they cannot manufacture enough plant food from the materials furnished them. As a result, the growth of new wood is very small; consequently the sap conducting power of the plant is reduced, and this again tends towards starvation. If this condition has not gone too far, and if the cause can be removed; that is, a better soil provided for the plant to grow in, the plant will in time recover itself. In the same way, other unfavorable conditions may injure the plant, and if any parasitic fungus or insect obtains a foothold it may continue the injury and make it worse, then we say the plant is diseased. All plant diseases can attack the plant more readily if it has been injured by a lack of proper care.

For the purpose of our discussion we can divide plant diseases into two kinds—those which injure the crop and those which injure the plant. Those which injure the crop may do a certain amount of damage, but this damage is only for one year. Those which injure the tree, in the case of orchard fruits, do a great deal more damage, because they injure all future crops by making the tree more or less unfitted to bear them. Further than this, the crop damaging diseases are in many cases also damaging to the tree, and it is the tree damaging phase that is of the most importance. Apple scab is an example of this. It forms spots on fruits and makes them unfit for market, but in addition to this it forms spots on the leaves. A large amount of it on a tree will so far cut down the leaf surface as to cause a diseased condition of the tree, due to the spots on the leaves.

There is one more way in which we should look at plant diseases in order to have an understanding of the way to diagnose them. We should look at the plant disease in relation to the orchard as a whole. It attacks only certain trees in the orchard according as they are susceptible or not, or according as the disease is spread across the orchard by the effect of wind or insects carrying it. This fact enables us to tell by observing the distribution of a disease in an orchard whether or not the trouble is above ground or below. If the trouble is above ground, a parasite that attacks the body or the leaves like San Jose scale, then we will usually find it scattered over the orchard, or spreading from a point of original infection. For instance, San Jose scale may come in from a neighboring orchard, and it will be found to spread outward from a point where it first entered. On the other hand, there are certain diseases of the roots. They usually depend upon soil conditions, living in a poorly drained or poorly cultivated place. Consequently we find them in the swales and low places in the orchard, or in a spring place where the moisture does not dry out of the soil readily after a rain. Such troubles are root rot and woolly aphis.

Look for a sufficient cause. Do not be too willing to jump at a conclusion and decide that you have found the cause of your trouble when you find the first insect or fungus which you may come across in the orchard.

Vanco

LEAD ARSENATE

Is better, in every way, than any other spray for Worms, Codling Moth, Potato Bugs, Asparagus Beetle and other leaf-eating insects.

VANCO sprays easier, sticks to the leaves better, does not burn the foliage, and always kills the insects. Contains guaranteed amount of Arsenic Oxide — of uniform strength and highest quality.

CHEMICAL LABORATORIES LIMITED : VANCO

It is made in Canada. This means no duty to pay, lowest prices, lower freight from a HOME industry.

Our book on Spraying is free. Write for a copy.

FERTILIZERS

We also sell Nitrate of Soda, Muriate of Potash, Sulphate of Potash and Acid Phosphate.

CHEMICAL LABORATORIES LIMITED

8-4 Van Horne Street, TORONTO.

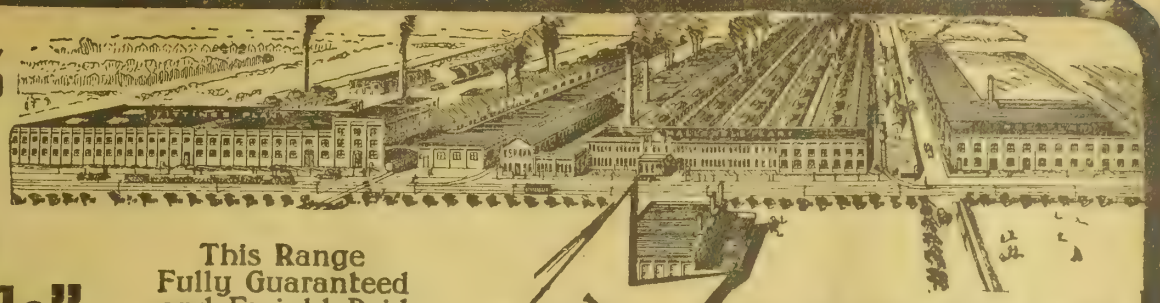
"BANNER"
Cold Blast Lantern
Double Seamed Well.
Cannot Leak!

A Calendar with every LANTERN.

Costs no more than inferior Lanterns!!

ONTARIO LANTERN & LAMP CO., Limited, Hamilton, Ontario.

Save over 35% of the purchasing price on your range by buying a "Dominion Pride" direct from the factory



This Range Fully Guaranteed and Freight Paid

$41 to $49

DIRECT FROM FACTORY to KITCHEN

WHY WE ARE ABLE TO SAVE YOU SO MUCH MONEY.

We make the Ranges and place them in your Kitchen. There's only one transaction and one reasonable profit made on the whole transaction. You don't have to pay a factory profit—then a jobber's profit—a retailer's profit—store rent and clerk hire—and expenses of travelling salesmen. Our great "Factory to Kitchen" Plan enables you to buy the best Range for the same price that the wholesaler and jobber would have to pay—and **LESS** than the retail dealer could get it for—and on better terms too.

"DOMINION PRIDE" RANGES

would cost from $69 to $78 if sold by retail stores. Our square deal way of dealing direct with you—and saving you all the profits made on ordinary ranges—enables you to have a "Dominion Pride" Range for $41 to $49.

"Dominion Pride" Ranges are made of best Blue Polished Steel and Malleable Iron. Polished steel does not need blacking—simply go over it with a cloth and it will stay fresh and bright. **Malleable Iron** will **NOT** warp, crack or break, as cast iron will. **Malleable Iron** is used by railroads for car castings, and by Farming Implement Makers, because of its superior strength. **Cast Iron Ranges are cheap**—even at their best—**and expensive for you** at any price because they soon go to pieces. "Dominion Pride" Ranges will last a lifetime because they are built right, of the right materials, **by people who know.**

SAVE OVER 30% OF YOUR FUEL

"Dominion Pride" Ranges have proved this by actual tests. Whether you use wood or coal "Dominion Pride" will cut down the cost of fuel by almost **one-third.** **COLD** rolled steel plate ovens, sectional iron lining Fire Box with air chambers—double walled flues, interlined with asbestos—extra heavy grates—all help to make "Dominion Pride" the most economical Range you can buy.

WE GUARANTEE THEM—ABSOLUTELY

Over 6,000 of our **RANGES** are in use in Toronto alone, and many thousands more in other parts of Canada. You get a Range that has proved its superiority in every way when you buy a "Dominion Pride," and our guarantee holds good for a year. This guarantee means everything to you—because you have an enormous factory and an old established Canadian Company back of the guarantee. Here's another point about "Dominion Pride" Ranges that is missing in Ranges bought at retail stores. You can always get new parts if you need them.

WE PAY THE FREIGHT—RIGHT TO YOUR STATION

Our price—direct from our Factory to your Kitchen is this—a "Dominion Pride" Range 8-18 or 9-18 top, with high closet shelf or elevated tank or flush reservoir, with zinc sheet to go under Range, 8 joints of blue polished steel pipe and 2 elbows—delivered to any railroad express station in Ontario, Quebec, New Brunswick, Nova Scotia or Prince Edward Island—for $41—

OR delivered to any railroad express station in Manitoba, Alberta, Saskatchewan or British Columbia—$49

$5 to be sent with order, balance to be paid when Range is delivered at your railroad station. If not convenient to pay cash we will arrange to accept your Note.

Our illustrated booklets tell the whole story of "Dominion Pride" Ranges, and explain the details of our "Factory to Kitchen" plan of saving you money. At least, write for the booklets. You'll find them wonderfully interesting. Send to-day.

Canada Malleable & Steel Range Mfg. Co, Limited, OSHAWA ONTARIO

[IN WRITING PLEASE MENTION THIS PAPER]

Leaf spots, or any other trouble confined to a small portion of the plant are a sufficient cause for disease only when they are very numerous. San Jose scale, as serious a disease it is, is dependent upon the number of individual insects for the trouble it causes. A few scattered scales do not do much harm. They are a warning, however, that you shall look for trouble in the near future, unless you get rid of them. A scale on one side of a tree, if it is small, is not sufficient cause for serious disease of the tree. If it is large, or if it girdles the tree, or girdles a branch, then it is sufficient. If the roots of a tree are nearly all rotted away with root rot, that is sufficient cause for a diseased condition of the plant.

Now, after you think you have found what is the cause of the trouble, and are convinced that it is a sufficient cause, what is the next thing to do? Finally, it is to use every possible means to get rid of the disease which you have found. Spraying is one of the most important things in this connection. It is necessary, however, that you shall

How to get Better Cows.

When a milk producer becomes fully convinced that there are cows in the world whose production of milk and butter and, therefore, of cash, is greater than those which he owns; the great question will be how to get these great producers. It is to be greatly regretted that this condition of mind does not come to the average cow owner nearly as often as it should; but if it does come how is he to proceed? He soon finds out that good cows sell for good prices, often prohibitive to the beginner. Then let him reason a little as to how these record breaking cows have been produced. The amswer is easy and very plain. Breeding, feeding and selection, perhaps for hundreds of years, have all helped this work along and the end is not yet, for new records are being made every year and almost every day. "What man has done, man may do." This axiom has been carved upon the ruins of some of the first structures built by human hands; and it has never yet been disproven. Again a certain Good Book says, "No man can pick figs from thistles," the lesson being that if figs are wanted figs must be planted. This reasoning is just as true of dairy cows as of figs. Hence we see the importance of the right kind of a start. Uncle Hiram Smith, one of the best dairymen of Wisconsin, said that the first and the right thing for a beginner in the dairy business to do was "to buy a bull." Brother Smith has gone to his reward but those who heard him then knew very well that he meant a dairy bred animal and if they followed his advice—and some did—they never regretted it.

Suppose this beginner has ten common cows, which are enough to start with, for the best way to gain experience in any business is to start near the bottom and work up. These cows must be bred to keep up a milk flow. Now, instead of trusting to luck and his neighbor's scrub bull, let him secure the services of a dairy bred bull whose female ancestors for at least two generations have been good producers at the pail. In the meantime, and if possible before his calves come, let him, by carefully using the scales and the Babcock tester, find out which are the best cows. Even with ten cows one is sure to find that some are more than twice as good as others. By carefully noting the build, contour and general characteristics of these best cows as compared with the poor ones, one may be able to buy a good producer now and then whenever he disposes of his poor ones. To learn to judge a dairy cow on sight is an excellent thing for a dairyman but it can only be learned where a lot of other things are—in the school of experience. By raising the heifer calves from his best cows he should, in about three years, be able to note some improvement provided, of course, he gets the female calves. But because of this element of uncertainty as to sex, do not invest in any of the sure things sometimes advertised to regulate this very important matter, for with all our learning we moderns can no more control the sex of our unborn stock than could the herdsmen of Abraham and Lot when they were contending over mavericks on the range of Palestine.

Excepting for this element of uncertainty as to the sex of calves from the right cows, this plan for both as individuals and collectively, both as indibiduals and collectively, is just as sure as anything can be in this rather uncertain world—as the sowing of seed or the planting of an orchard, for instance. The writer has tried it many times, always with good results. The experiment stations of the world are trying it all the time with some wonderful successes; all the breeds in all the years of the past have been and are still being improved in precisely this manner. Why, then, should the individual hesitate? Perhaps he is in doubt as to which breed is the best. This is really a small matter. Any of the dairy breeds are good if he gets something that is not only dairy bred but of a dairy type as well; but when he starts with a breed let him stick to it. Changing breeds is a little like changing wives— of little benefit and sometimes expensive. Now comes the all important question of this materialistic age. "Will it pay?" Here is just a small indication a sign of the times, as it were. In one issue of a well known dairy paper under the head of "Cows Wanted" were offers of about 1,000 young dairy cows, mostly for carload lots, one party even going so far as to say that price was no object provided they could show the right kind of records. As to the satisfaction there is in the matter, that depends somewhat upon whether one just wants to keep cows or have his cows keep him. The dairyman is said to be tied to a cow's tail anyway, and if this is so, methinks the tail of a good cow is preferable.—N. S. French.

Picking Out Good Dairy Cows.

There was some strong addresses at the recent annual session of the Vermont dairymen's association. That of Prof. Cook, of New Yark on the dairy type was especially well received. A cow from the university stables was brought on the platform and the discussion thoroughly illustrated. The speaker opened the address with the statement that there are different opinions as to the ideal type of a good cow. Not all good cows would be of the same conformation for the one selected for the

Cream Profits That Stay in Your Pocket

THERE was a time when the first cost of a cream separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necessary. Men have learned that in the

Empire Disc

Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest returns for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

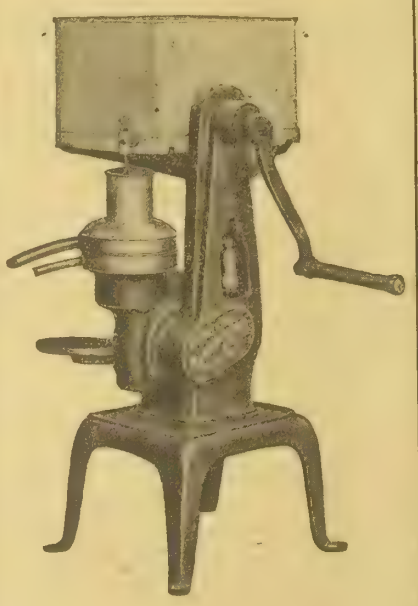
Farmer Agents Wanted in Unrepresented Districts.

THE CAPITAL CREAM SEPARATORS.

THEY MAKE COWS EARN MORE.



STYLE A—Made in 2 sizes, Nos. 6 and 8, Capacities, 500-750 lbs per hour Ball Bearings used throughout. Splash system of oiling. Tank 36 inches high.

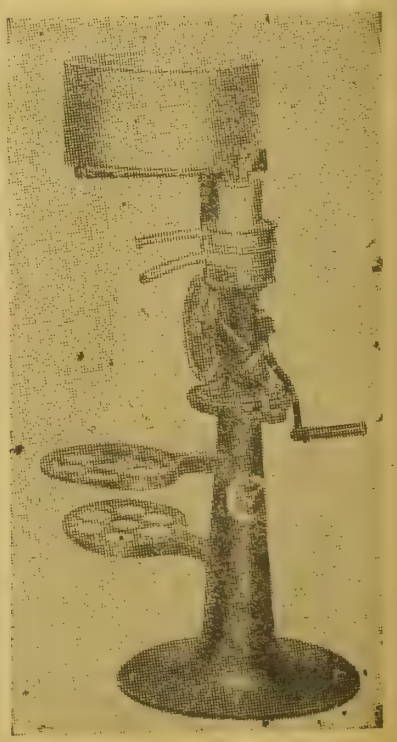
We now have to offer two types of The Capital as the cuts show, yet the same bowl is used in either machine. The Capital bowl is acknowledged to be the lightest, most compact, easiest washed bowl on the market. It weighs less than four pounds—has five parts—can be taken apart, washed and assembled in a couple of minutes This bowl, in the Capital Separator, is partly responsible for the Capital winning 20 PRIZE AWARDS since 1901, in the countries of Denmark and Sweden—the real dairy countries. The Capital is the easiest separator, of equal capacity, to operate—it is the only woman's separator on the market. The light, easy running bowl, together with the arrangement of the strong simple gears, make it the easiest running separator, and last, but not least, the Capital is a close, clean skimmer. This we guarantee.

Both styles equipped with the Capital clutch device—the gears stop running instantly when you drop the handle. We save YEARS with our GEARS by saving all the running down wear. A postal will bring you full particulars. Address nearest branch.

The National Manufacturing Company, Ltd.,

Maritime Branch—MONCTON, N B.

OTTAWA, TORONTO, REGINA, SASK. EDMONTON, ALTA.



STYLE B—Made in 2 sizes Nos. 3 and 5 Capacities, 350-500 lbs. per hour. Phosphor Bronze Bearings and Bushings throughout. Tank, 44 inches high.

We will accept other makes of Separators in purchase price of the Capital.

It Is Miserable To Be Dyspeptic.

Dyspepsia is one of the most prevalent troubles of civilized life, and thousands suffer untold agony after every meal.

Nearly everything that enters a weak dyspeptic stomach, acts as an irritant; hence the great difficulty of effecting a cure.

The long train of distressing symptoms, which render life a burden to the victim of dyspepsia, may be promptly relieved by the use of Burdock Blood Bitters.

Mrs. John Sherrett, Fortier, Man., writes:—"I was troubled with dyspepsia for years. A friend of mine told me about Burdock Blood Bitters, so I got a bottle to try, and before I was half finished I could eat anything without suffering, and when I had used two bottles I was sound and well. Now I feel just fine; indeed I can't say too much in favor of your medicine."

Burdock Blood Bitters is manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

MIDDLETON, NOVA SCOTIA.

Six Dairy Essentials.

On the recent trip which the Missouri agricultural college special Burlington train made over the state cards were distributed giving the following six essentials for improvments in dairy farming:

Feed your cows liberally enough to allow the good ones to show up.

Cut out those that do not make a profit and keep the best. ...At least one-third of the cows in Missouri are unprofitable.

Weigh the milk of each cow regularly and have it tested monthly, if possible, by the Babcock test.

Use only a purebred bull of a strictly dairy breed and from the best cows with great care.

Feed your cows silage, clover, cowpeas or alfalfa hay and one pound grain to three pounds milk produced. kind of cow you wish to raise.

Raise the heifer calves from the demonstration. After an experience of a lifetime, Prof Cook believes the only sure way to tell a good cow is to bring out the scales and Babcock test.

One cow that came pretty near beeligible for the booby prize had to her credit 500 pounds butter for the year. Prof. Cook mentioned this to show how impossible it is to judge a cow entirely on her looks. As a man looks the dairy cow in the face, she should show a good head and a fine eye, not too prominent. The lips should be strong and the nostrils large with good openings Strong should be wide between the front legs and have a good length of body. My experience is, a good dairy cow has good, heavy shoulders, not beefy for, in fact, there should not be a bit of fat on the dairy cow.

THE UDDER AND MILK VEINS.

The ribs should be far apart. The mammary veins do not always indicate what the cow will produce, but they come pretty close. Milk veins should be prominent and many of them. This indicates a good blood circulation. Contrary to the impression of many, there is no milk in the milk veins. They are filled with blood returning from the udder to the heart. I always like large milk wells or openings. I like to see milk veins on the udder.

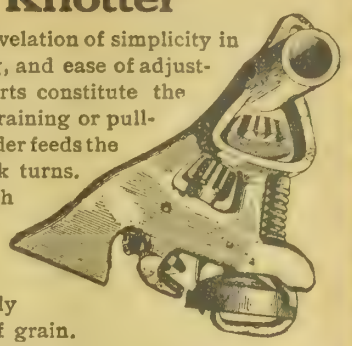
The skin of the animal should be loose, and snap back when released. Watch out for a thin-skinned, papery hide; such an animal is likely to have poor digestion and unable to reproduce herself. I never saw a hide too thick if it snapped back on quick release. I do not want a thin, small tail, and do not take much stock in an extra long one. Many make a sad mistake in feeding cows too heavily before they freshen. They should be placed on a diet two weeks before parturition. It is a terrible shock to the cow when the blood flows from the fectus to the udder.

Use great care in selecting bulls to head the herd. The bull should have the opposite conformation of the dairy cow. If he has thin, peaked hams his heifers will be sure to have the same. As to the cow's udder, much can be told by the texture as to what will be done inside. It is a great mystery to know just why, how and when one cow does remarkable stunts at the pail, while another does little or nothing. Some men wearing a No. 6 hat will turn out more work and results in one day than a man wearing a No. 7 hat will in one year. No one knows just why.

So it is with the udder of the dairy cow. There seems to be a peculiar functional activity with the udder of some cows to turn out a lot of work. They have the peculiar ability to take a lot of nourishment from the blood as it passes through the udder. That is why we urge farmers to select the cow with extra good circulation. If the milk veins are prominent on the abdomen and udder it indicates a good circulation, and the probability that a lot of nourishment is being utilized through the udder. A soft, velvety or silky udder is as good an indication as I know of what is going on inside.

McCORMICK

A Simple Knotter



THE McCormick knotter is a revelation of simplicity in construction, accuracy in tying, and ease of adjustment. Only two moving parts constitute the working mechanism. There is no straining or pulling of the twine because the twine holder feeds the twine in the direction the knotter hook turns.

The cutter bar has guards in such a position that the machine can be tilted to cut close to the ground without pushing trash and stones ahead of the knife. It cuts smoothly and perfectly in all conditions of grain.

The McCormick reel has a wide range of adjustment. It successfully meets the conditions encountered in any field, whether the grain is tall or short, standing, down, or tangled. Grain filled with green undergrowth is forced upon the platform.

The McCormick floating elevator handles grain of any length or weight without clogging, even when the grain is filled with vines or green undergrowth.

There are many other features and advantages of McCormick binders. The McCormick agent will tell you about them. He will tell you about the wonderful strength of each individual part and of the strength of the binder as a whole—of the skilled workmanship backed by many years of experience that enters into the construction of every McCormick binder. Why not see him today? Ask him about McCormick haying machines and tools.

If you prefer, write to the nearest branch house for catalogue and any special information you desire.

HOLMAN, "The Gypsum Man."

Sells Gypsum Direct to Farmers and Farmers' Clubs.

Gypsum (Land Plaster) stops the tremendous waste that annually occurs in your manure heaps; use it liberally in your stables and help to keep them in a sanitary condition; sprinkle it on your potato sets and it will keep them without shrivelling and in a vigorous condition for growth, even if they are cut a long time before they are planted; use it on your dry soils to conserve moisture and on your wet soil to help sweeten it.

Gypsum is cheaper than lime and has a more favorable effect on the soil, as it does not liberate the stored up plant food in excessive quantities.

I have installed a plaster mill and am now prepared to grind Gypsum at my Sussex quarries. Write me for prices on car, ton or hundred weight lots. It would be extravagance to farm without using Gypsum when I can quote you such low prices.

Wm. A. Holman, "The Gypsum Man,"

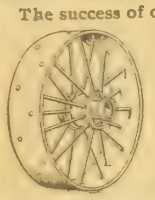
Sussex, - - New Brunswick.

Load This Wagon To the Fullest Capacity.

Every dollar invested in a T-K Handy Farm Wagon will be repaid over and over again in saving work loading and unloading, besides this wagon will carry as heavy a load as any pair of horses can draw, without tiring them. It earns money for you and makes farm work easier.

TK Handy Farm Wagons and Wide Tire Steel Wheels

The success of our Wide-Tire Steel Wheels has been unprecedented in the history of wheel manufacture. They solve the problem of getting over the worst roads without lightening the load or tiring the horses. Mud won't clog them, bad roads won't injure them, yet they are cheaper than wooden wheels.



TUDHOPE-KNOX CO., Ltd., Orillia, Ont.

LIVE STOCK

The Sow and Pigs.

The first thing I would do if the sow has just farrowed, would be to give the sow a good drink of warm water, if it was in winter, and cool water if it was in summer. In a few hours I would give the sow a light feed of shorts made into a slop or mash by using water or milk and add a little tankage if you have any on hand. Feed about the same again at night. Next morning increase the feed a little and give a little chops or corn in addition to the shorts, etc. From this on I would gradually increase her feed until I had the sow on about a full ration or the milk flow satisfied the pigs.

As you increase the feed, the pigs should be watched closely on account of the scours. One heavy feed for the sow will ruin a litter of pigs sometimes on account of the scours. If at any time any sign of scours is noticed, cut the feed to about one-half or one-third of the amount, and feed dry for two or three feeds and then increase as before, always trying to feed not too much or too little. I believe it is better to feed not quite enough and be sure, than to feed too much and run the risk. Would use a shallow trough, so the pigs could eat when they get old enough, as they will learn to eat much quicker by getting to eat with the sow and by the time they are six or eight weeks old they can be weaned if you prefer, and they will hardly know it if you use the proper feed, judgment, etc.

In conclusion. I will say that I breed the first time they come in afwant to breed my sows I usually breedthe first time they come in after farrowing, which is about eight or ten weeks. In about ten days or two weeks after they are bred, the pigs had just about as well be chewing on rags for what they get, as to be trying to get milk from the sow. The pigs soon find out the same thing. If I don't want to breed the sows, it won't hurt the pigs to suck until they are about ten weeks old, and then the sow will wean them; that is, in most cases.—Coleman's Rural World.

Laying the Foundation for a Good Herd of Cattle.

If there is one animal more than another which does not get its just deserts on the average farm, it is the calf after weaning time. This is especially true of the one dropped in the spring and too often the neglect it suffers during the first winter dwarfs or stunts it so that whether intended for beef or for the dairy it never attains to the best it would have been capable of with better treatment.

The up-to-date cattleman makes good provisions for his calves, so that growth is continuous, recognizing that the sooner an animal can be hurried to maturity the greater will the profits be. The well-informed dairyman has also learned the lesson that he cannot make record-breaking milkers from calves that receive a setback in growth at any period, and the sooner everyone who owns a calf or calves recognizes this, the sooner will he be able to add to the profits from the live stock branch of his farming.

Whether there is only one calf or more, the first thing is to make provisions for feeding away from older stock, for the youngest and weakest are invariably crowded away from manger or feed rack and get only the leavings when the stronger are satisfied. The same is true of shelter. Give the calves the warmest corner of the stable or barn and do not expose them to all kinds of weather.

Of course, they must have exercise, but this can be had when it is not raining or snowing, and they must by all means have a warm, dry bed at night. Comfort means money for it is only the warm, well-fed animals that thrives.

As to feed, there is nothing better than alfalfa, clover or cowpea hay for a part of the ration, for all young animals must have protein to build up bone and muscle. In addition to above, shelled corn, chopped corn or even corn on the cob, if chopped in small pieces, makes a fairly well balanced ration, as it furnishes the carbohydrates demanded.

If timothy hay and corn fodder constitute the roughage at hand, then the protein must be furnished in the shape of bran, oil meal or other commercial feed stuffs, but it always pays to raise such a variety of crops as will furnish a balanced ration for the farm animals from the home products, thus saving middlemen's profits, freight and other charges.

Given comfortable shelter, opportunity for exercise, proper feed for growth as outlined above, and water at regular intervals, with salt before them at all times, there is no reason why the calves should not come out sleek and thrifty, ready to make the best possible use of the luxuriant feed which spring will bring. On the other hand, if not so cared for, the poor creatures are rough-coated, skinny and listless, and it takes weeks of spring sunshine and green grass to put them where they should have been at the close of winter. It is easy to see then that good care of the calf pays.—D. C. Cornman, in Farmers' Review.

Pig Eating Sows

"Some sows are cannibals by habit," says Wallaces' Farmer; "others eat their offsprings simply because their ration has been unbalanced. Sows which habitually eat their pigs should of course never be bred, but should be fattened and sent to market as soon as possible; but with some, which have offended but once, the cause is probably an unbalanced ration. We would keep them, giving good feed and care till farrowing time. The feed should be corn balanced by some protein feed such as oil meal, bran or shorts. If just a straight corn ration is given, the sow can hardly be blamed for devouring her pigs, since her system cries out so strongly for protein and ash, the compounds which are found in such large amounts in the bodies of the young pigs.

Sows which receive o proper ration before farrowing rarely eat their pigs; but when sows are considered to be in danger of forming the habit, some of the following remedies, which have been recommended in a week before farrowing time, place the past may be used: First, about the sow in a pen by herself, and give in her feed, every other day, for three times, two tablespoonfuls of common soda. A Keokuk county, Iowa, correspondent recommends this as a sure preventive. Other subscribers have suggested feeding a pound or a pound and a half of salt pork, in order to overcome the soX's craving for flesh food. Still another subscriber suggests smearing kerosene very lightly over the little pigs, by means of a flannel cloth. We have not tried any of these remedies but all of them have been recommended as being successful.

PEOPLE use ML Floorglaze for the hulls of sailboats and motor-boats, and are satisfied with the way it looks and lasts.

That proves M L Floorglaze is water-proof. A good all-purpose finish, therefore.

PEOPLE use ML Floorglaze on vehicles, too, and find it looks better and lasts longer than any kind of varnish or paint.

That proves M L Floorglaze is fade-proof and weather-proof. The perfect protector for all woodwork, therefore.

PEOPLE find that ML Floorglaze helps housewives keep floors dust-free because the surface stays glass-hard and glossy.

M L Floorglaze doesn't mind wet, sun, scuff of feet nor dragging of furniture across it.

ML FLOORGLAZE is the best thing you can get to help renovate the whole house. Fine for all woodwork, indoors and out. Makes old furniture look new again. Goes farthest, too—gallon covers 500 square feet.

Choose among 17 pretty colors in solid enamel—seven Lacs to imitate hardwoods—and Transparent for natural finish. Comes in little and big tins. Easy to put it on right. Ask at your dealer's or write us for news of the hundred uses you could make of M L Floorglaze. The Imperial Varnish & Color Co., Limited, Toronto

Don't Out Ration.

The season between hay and grass is a critical one for the dairyman. The use of the expression "between hay and grass" has by custom become common to a great many people who realize little of what it really signifies. The man to whom hay and grass are vital necessities in his business finds this expression full of deep meaning.

It often happens that a farmer finds that his store of hay and other roughage is falling short about this time of the year, and to such a man the significance of the expression we have used is fully apparent. Although it is the season between plenty of hay and plenty of grass, it is, however, still the season of hay, and that fact should not be lost sight of by the dairyman who expects to make something out of his cows.

There is frequently a temptation when the farmer finds that his hay is running short, to economize on his feeding in anticipation of the season of plenty which is rapidly approaching. The theory is, of course, that it will be chegper to shorten the allowance of feed for the cows for a brief season than to buy expensive feed in the attempt to keep the milk flow up to the normal with the belief that it will be all right when the full feed of green pasturage comes on. This is a dangerous theory to work on, for it will undoubtedly be found, if comparison is made, that the diminished flow of milk which results from a shorter food ration in the between seasons will be made up again only by a greater final cost than would have been required to keep the flow where it was originally.

The man who has a silo is not likely to get caught in such a condition as this, or to have this problem for solution. It is better also to have just a little too much hay in the barns when the spring is fairly early and the succulent grass feed comes on in good season than to run short of hay in the late spring, making it necessary to rustle around to make up the deficiency.

The cows will enjoy being turned out into the field to browse around a little, as the weather gets warm, but if they are expected to keep right on making a profit they will not be hurried out where they will be compelled to hustle for their living in the early spring. Such advice as this is superfluous to the good dairyman, but there are men who will do just such things as this, seeming to believe that whatever the cows can be induced to eat will do the work.

HOMESEEKERS' EXCURSIONS

The Grand Trunk Railway has issued a circular authorizing all Agents in Canada to sell Homeseekers' Excursion tickets to points in Western Canada. This is interesting information for those desiring to take advantage of these excursions on certain dates from April to September 1911. The Grand Trunk Route is the most interesting, taking a passenger through the populated centres of Canada, through Chicago, and thence via Duluth, or through Chicago and the twin cities of Minneapolis and St. Paul. Ask Grand Trunk Agents for further particulars.

BETTER THAN SPANKING.

Spanking does not cure children of bed-wetting. There is a constitutional cause for this trouble. Mrs. M. Summers, Box W. 892, Windsor, Ont., will send free to any mother her successful home treatment, with full instructions. Send no money but write her to-day if your children trouble you in this way. Don't blame the child, the chances are it can't help it. This treatment also cures adults and aged people troubled with urine difficulties by day or night.

Gasoline for Sheep.

Five years ago, 30 percent of my lambs and 10 percent of the breeding flock died, and on examination found hosts of stomach and intestinal worms, besides some tapeworms. Losses had gradually increased in the years preceding. Of the lambs that did not die, none were fat, and many were worthless.

I began to drench with gasoline, and used one gill of turpentine to ten pounds of rock salt kept before the flock. The gasoline and turpentine used persistently lessened the mortality and improved the tone of the flock each year. From my own and the experience of others, I doubt if any remedy can clean up a flock badly affected with stomach worms. I know that gasoline is sure death to tapeworms. Last April I secured 100 pounds of tobacco dust and mixed one part tobacco or two parts of salt and kept it before the flock all the time, having the box low so the two-weeks-old lambs could reach it.

Results: I have not lost a sheep or lamb since, and the lambs at six months average 100 pounds. Since using tobacco, have drenched the lambs once at weaning with gasoline. I shall continue to feed tobacco. A year ago many of my sheep coughed badly and discharged much from their nose; the trouble increased so that 75 percent were affected. I drenched every sheep twice in three days with a tablespoonful of turpentine in one gill of milk. In a week's time the cough stopped and thir noses were clean. —American Sheepbreeder.

Sheep Notes.

Don't start into the sheep business too heavily. Start with a few at first, and grow, yourself, as the flock grows.

Don't let the sheep get wet. Takes a long time to dry out their heavy coats of fleece. Provide shelter. In case of storms, it pays big.

Look out for sore teats on ewes with lambs. When such conditions are discovered, rub the affected parts twice a day with salted butter.

Healthy, well-conditioned sheep do not readily become infested with worms or other parasites. Feed is more beneficial than worm powders or prepared tonics.

Give the sheep exercise every day. Feed them their fodder outside, even on cold days. They are well clothed and will keep warm.

Before lambing time all of the tag locks should be clipped from the udder so that the little fellows will have no trouble in finding that they want.

Hog Notes.

As a rule, when properly fed and cared for a mature sow will keep in better breeding condition and will give her owner more years of profitable service if she farrows two litters of pigs a year than if she has only one.

If the trough for the sow is made flat and shallow, and the slop fed the sow is sweet and warm, the pigs will begin to eat at three weeks old; but if the food is cold and sour, they will refuse it as long as the plans of nature give them warm sweet milk.

To give the pigs a good start in life, the sow must be well fed, both before and after farrowing. It is not necessary that she should be kept very fat, but she should be kept in good flesh, thrifty and vigorous. After farrowing, the mother's food may be carefully and judiciously increased as the pigs increase in size.

RUBEROID ROOFING

Trade Mark Registered. Pronounce it RUE-BER-OID.

PROTECTS FROM FIRE

When Campbellton, N. B., was destroyed by fire on July 11th and 12th, 1910, the only business building left standing in the town was roofed with RUBEROID. An all-night shower of sparks and burning brands failed to ignite the Ruberoid.

When the Brussels International Exhibition Buildings were practically wiped out on August 14th, 1910, five kiosks roofed with RUBEROID remained intact right in the centre of the fire-swept area

FREE TO YOU—MY SISTER

FREE TO YOU AND EVERY SISTER SUFFERING FROM WOMEN'S AILMENTS.

I am a woman.
I know woman's sufferings.
I have found the cure.

I will mail, free of any charge, my home treatment with full instructions to any sufferer from women's ailments. I want to tell all women about this cure—you, my reader, for yourself, your daughter, your mother, or your sister. I want to tell you how to cure yourselves at home without the help of a doctor. Men cannot understand women's sufferings. What we women know from experience, we know better than any doctor. I know that my home treatment is a safe and sure cure for Leucorrhœa or Whitish discharges, Ulceration, Displacement or Falling of the Womb, Profuse, Scanty or Painful Periods, Uterine or Ovarian Tumors or Growths, also pains in the head, back and bowels, bearing down feelings, nervousness, creeping feeling up the spine, melancholy, desire to cry, hot flashes, weariness, kidney and bladder troubles where caused by weaknesses peculiar to our sex.

I want to send you a complete 10 days' treatment entirely free to prove to you that you can cure yourself at home, easily, quickly and surely. Remember, that it will cost you nothing to give the treatment a complete trial; and if you should wish to continue, it will cost you only about 12 cents a week or less than two cents a day. It will not interfere with your work or occupation. Just send me your name and address, tell me how you suffer, if you wish, and I will send you the treatment for your case, entirely free, in plain wrapper, by return mail. I will also send you free of cost my book—"WOMAN'S OWN MEDICAL ADVISER" with explanatory illustrations showing why women suffer, and how they can easily cure themselves at home. Every woman should have it, and learn to think for herself. Then when the doctor says—"You must have an operation," you can decide for yourself. Thousands of women have cured themselves with my home remedy It cures all, old or young. To Mothers of Daughters, I will explain a simple home treatment which speedily and effectually cures Leucorrhœa, Green Sickness and Painful or Irregular Menstruation in Young Ladies. Plumpness and health always result from its use.

Wherever you live, I can refer you to ladies of your own locality who know and will gladly tell any sufferer that this Home Treatment really cures all woman's diseases and makes women well, strong, plump and robust. Just send me your address, and the free ten days' treatment is yours, also the book. Write to-day as you may not see this offer again. Address:

THE HORSE

Raising an Orphan Foal.

A correspondent asks that we offer some suggestions as to raising a motherless foal. It is not a hard trick, but it is one on which great care must be expended. Indeed, I have always thought that a good woman was better fitted to bother with an orphan foal than any man that ever lived. It is a job that requires everlasting patience and vigilance—that sort of maternal fussiness that has insured the propagation of the human race from the Adamic era to the present day. I have raised several motherless foals. Two of them never drew a drop of milk from their mothers. One of the mares in question was hooked to death by a band of big steers in an open yard. She lay down to foal not far from the bars. The steers smelled the unwonted odors incident to parturition went crazy, as is the wont of such villainous brutes at such times, smashed down the bars and the railf?nce, and hooked the poor prostrate mother to death. How the little one ever managed to get into a manger which protected him against the onslaught of the crazy cattle is a mystery to this day unsolved, but he did and I reared it to a maturity that sold for $200.

The other case in which I had to deal with a foal that never sucked arose in a still more miraculous manner. A mare owned by the man for whom I worked was not in my charge and, when right close to her foaling she was placed in a field. Next morning the foal was found on his legs in the field, and the mare stone dead just over the wire fence on the strip of sod along the road. Whether the mare had foaled in the pasture and subsequently escaped over the fence, or wether she had broken out foaled on the highway and the foal scrambled over the wire fence I never knew. Th?re were no breakages of the fence, no abrasions on either mare or foal, save a little scratch on the inside of one of its forearms. But the wax was yet on the dead mare's dugs, so I knew the foal had never sucked. Nor was there sign of struggle. She lay there as peacefully as though she had stretched out for a sleep. Such other cases as I have had to do with were foals whose dams died after giving of their colostrum to their young. I mention these details to show that the few bits of advice offered hereafter are the result of personal, practical experience, not of anything I ever read in a book. Indeed I would not know where to go, save to my own work, for any information on this subject.

Men have told me that they have knocked on the head foals whose mother is dead in parturition. Such men should be sent to the penitentiary. There is no reason why a foal so suddenly left an orphan should not be kept alive and made to grow and thrive and finally make up into a good horse. Suppose we start with a foal that never sucked its dam. It is a fact of which there is no disputing that the new-born young needs little if any nourishment right at the start. Hence we must begin with an infinitessimal quantity of cow's milk. The milk of the mare shows usually not quite 3 per cent of butter fat. The average cow's product somewhat more, or let us say 4 per cent. The difference is not very great after all, but the more nearly we can come to getting the milk of a newly calved cow the easier our task will be. The poorer in butter fat the cow's milk is the better for our purpose. Never use Jersey milk with its 5 or 6 per cent of fat to rear an orphan foal.

For the first nourishment we offer our "orphling" take a tablespoonful of the best white granulated sugar and dissolve it in a little warm water. Then add three tablespoonfuls of limewater and enough warm, fresh cow's milk to make a pint. Get a baby's bottle or better still an old China teapot over the spout of which has been stretched the thumb of a worn kid glove. Pierce the kid with a darning needle in many places. The bottle, of course, will be fitted with a rubber nipple. See that the apparatus is scalded so that no infection may be conveyed, and let the youngster have half a tea-cupful of the mixture described for his first attempt. The milk should be at about body heat—neither colder nor warmer Let him have a chance to suck his nipple every half-hour at first—not more than half a tea-cupful at a time. Oh, yes, it is lots of bother an trouble, but there is much at stake and, though trite, the saying may be repeated whatever is worth doing is worth doing right.

If a foal scours, which he probably will, discontinue the milk altogether. Give a dose of a couple of ounces of castor oil and let him have two or three feeds of the limewater and sugar, with plain spring water in place of the milk, always at body heat. If nothing at all is fed for an hour or two hours after giving the castor oil, no harm will be done. All foals reared by hand will scour to some extent, but the castor oil, and the elimination of the milk will generally prove a penacea for that evil. As the youngster increases in age increase the amount fed day by day, going very slowly at first. To begin with he will require a vast number of feedings, then later the times of nourishment may be cut down to eight, then six, then four times a day by the time he is three weeks old. Now he may be fed the milk and limewater from a bucket and the sugar may be eliminated entirely. Watch keenly for signs of scouring and when they appear, cut off the milk entirely, and give caster oil in doses of three to four ounces. Invariably keep fresh well or spring water where the foal may drink at will.

From this it may be seen that it is an abominable chore to try to rear an orphan foal, but it is a job that is well worth doing. No animal that is bred on the farm is in its extreme youth half so interesting as a foal. He will teach the man who essays to raise him a world of lessons in patience, for, contrary and delicate as calves can be at times, they are not in the same class as a long-legged, gangling sprig of the equine race. There are more ways they can think up whereby to handicap and annoy their caretakers than could be counted in an hour, but they are lovable little beasts at the worst, and once you get them started aright they simply swell in size and growth and seem to be working time and overtime to make their feeders whole.

As soon as he will nibble at it let him have oatmeal. Pet and coddle the orphan in every possible way and at every possible opportunity. Fondle him, put a little, well fitting halter on his head, and early teach him that you are his very best friend on earth. Never let him get lonely. At two months old some sweet skimmed milk may be substituted for the whole fresh, warm milk from the cow. The amount fed must be governed by the eye of the master. No hard and fast rules can be laid down for the amounts necessary. It is best always to err on the side of frugality rather than of excess, but if the foal is supping up his lacteal ration with avidity and clamoring for more, why, increase judiciously. If the substitution of the sweet skimmed milk is judiciously done, by the time the youngster is three months old he may be fed skimmed milk entirely, and he may have all he wants to drink three times a day, always from a bucket that has been thoroughly scalded and is therefore free from foulness of all sorts. Remember that point. Sour milk or the residue of sweet milk, left in the bucket to sour and breed bacteria, is a sure foal-killer. Better take the little one out and shoot him dead in the head than try to rear him on sour clabber fed out of dirty utensils. A strenuous job, my masters, every foot of the way, but by the time we have the little chap drinking all the sweet, skimmed milk he wants three times a day, the task is nearly finished.

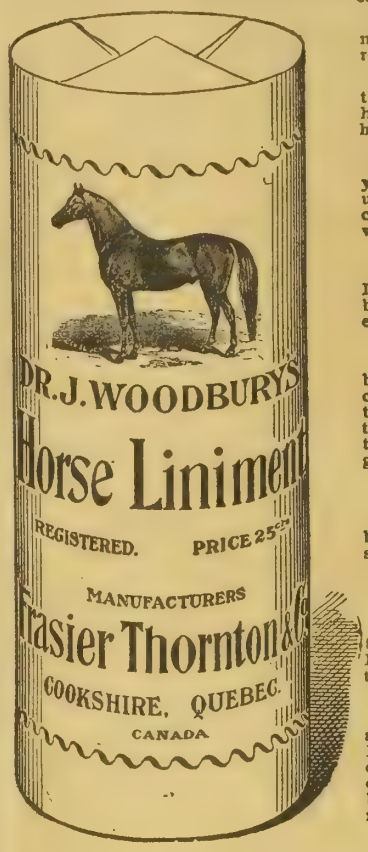
He should have grass and he should have companionship. A runty calf made a splendid mate for one of the orphans I once raised. Company he must have, for a foal is a playful thing and hates solitude. Pet and coddle him whenever possible and—quoting from "The Horse Book"—"treat him as every orphan should be treated, with loving kindness and care. Don't jam him in a little stall. Give him the run of a little lot with some grass in it. Don't let the older horses bully him. Never turn him out, a stranger with them. They will worry him to death and the mares may fell him into eternity by well planted kicks at any moment. He is a sort of a thing apart for the time being. He will play with his little bovine companion by the hour. He will race to meet his feeder. Summing it all up the rearing of an "orphling" foal is more in the man or woman who sets out to do the job than inany sets of rules that I, or any other living man, can set down on paper. Of course, he should have all the grain he wants to eat and likewise all the dry hay in addition to the grass. Give him all the grain he will eat—that is the main thing—and let him drink the skimmed milk as long as you wish. Finally, taper off gradually, reducing the milk-supply until the grain he is eating is keeping his flesh up to the mark and his growth just as it should be. And so endeth the lesson on rearing orphan foals.

DR. J. WOODBURY'S Horse Liniment.

INFALLIBLY THE REMEDY.

For the removal of Splints, Bog Spavins, Enlargements of any and every description it has no equal, Given internally, it will promptly relieve and remove any and every character of Cough, Enlargements of the Glands, Affect ons of the Kidneys. For Distemper, Strangles and Colic it is infallibly the remedy.

All horses that are stabled should have an applicatiou of Dr. J. Woodbury's Horse Liniment to the hoofs of the fore feet to prevent their becoming feverish, dry, brittle, hard, contracted or otherwise injured.



Insist on having Dr. J. Woodbury's Horse Liniment. We warrant it to effect that for which it is recommended when used according to directions.

Its beneficial effects are so prompt and decided that it has excited the admiration of the leading horsemen of the Dominion and secured their highest confidence.

Bear River, N. S.

Dear Sirs :—We do not hesitate in recommending your Dr. J. Woodbury's Horse Liniment. We have used it in the woods for coughs, colds, distemper and cuts, and would say that no lumberman should be without it. Yours truly, CLARKE BROS.

Hubbard's Cove, N. S.

Dear Sirs :—I have used Dr. J. Woodbury's Horse Liniment in my stable for years and consider it the best liniment on the market for both internal and external use. Yours truly, C. C McLEAN.

Truro, N. S.

This is to certify that I have used Dr. J. Woodbury's Horse Liniment with the very best results for colds, coughs, distemper and all lung diseases. It is the best thing to give horses in the spring to keep them in condition It purifies the blood, cleanses the lungs from impurities, which may exist, and gives the system healthy action.

NEWTON LEE, Owner "All Right" 5817.

Elmsdale, N. S.

Dear Sirs :—Kindly send me 6 dozen Dr. J. Woodbury's Horse Liniment. I have not a bottle in the store and it is the only kind my customers will take.

Yours truly,
ELMSDALE MERCANTILE CO.,
Elmsdale, N. S.

Dear Sirs :—I cured my horse with Dr. J. Woodbury's Liniment. It was a bad case of distemper. I always recommend this liniment to my friends as the best for all diseases of the horse. Yours truly,
H. R. WHITEHEAD.

Dear Sirs :—One of my horses had a bad cough, and I made a complete cure with three bottles of Dr. J. Woodbury's Horse Liniment. The cough was of twelve months' standing. In my large experience with horses, I consider this liniment to be the best made for all diseases in the horse, and I recommend it to my friends.

THE UNDERFED

How Children of the Ignorant Are Robbed of Oatmeal

A canvass made among the intelligent shows that seven homes in eight serve oatmeal. Among the ignorant another canvass shows that not one home in twelve serves oats. The children grow up incapable because bodies and brains are starved.

Nature stores in oats more energy food, more brain food, more nerve food than in any other grain that grows. That's why children crave oatmeal. There is nothing to take its place.

This is a food on which it doesn't pay to be careless. There is a very wide difference in oat foods—a difference in richness and food value. Don't serve the common kind.

Only the richest, plumpest grains are used in Quaker Oats. They are selected by 62 siftings. Only ten pounds are obtained from a bushel. The result is a food rich in all the oat elements—the utmost in oatmeal. Yet the cost to you is but one-half cent per dish.

Made in Canada. (171)

POULTRY.

Farm Fattening Poultry.

W. A. Lippincott, of the Poultry Department of the Iowa State College, writes that his department has undertaken to investigate the farm fattening of chickens and for the past three years has been carrying on experiments to find out just what could be done with profit on the farm. While the experiments will need to be repeated a good many times to determine exactly what is best to do, we can say with reasonable assurance that fowls may be farm fattened with good profit. The amount of profit varies with the section of the country. If one is in touch with the city markets, the profits may be considerably more than those secured in these experiments.

While a great many different rations were tried out, only those giving the best results will be mentioned. The poultry department purchased seven dozen Barred Plymouth Rock cockerels from a local produce man at 13 cents per pound. These ran in weight between 3 and 3½ pounds. They were placed in slatted crates. These crates were 20 inches deep and 16 inches high, divided into three compartments. Each compartment held four birds. For convenience we used portable houses 8 by 12 feet which held four crates. In practice on the farm, any shed that affords shelter and fresh air without draughts may be used. The birds were fed in troughs just in front of these crates. These troughs were removable so that they might be easily washed and cleansed.

The ration which gave us the greatest as well as the most economical gains was made up of equal parts by weight of corn meal, ground oats, hulls removed, ground barley, hulls removed, and beef scrap. To this was added twice its weight of buttermilk. No water was given. The same amount of well soured milk in place of buttermilk gave nearly equal results when mixed and allowed to stand twelve hours before feeding. The birds were fed twice daily as much as they would clean up in twenty minutes. The high art of fattening poultry seems to rest with the feeder's ability to sense when the fowls have had almost enough, but would like one or two mouthfuls. When that time is reached, remove the food at once. It is better to underfeed a trifle than to overfeed. If fowls are overfed they "go stale," refuse to eat well, and so fail to make good gains.

We fed these birds for two weeks. They uniformly made greater gains the first week than they did the second. They also uniformly ate more food the second week than they did the first. In other experiments it was shown that the birds would make gains the third and even the fourth week of feeding, but they were not great enough to pay the expense. At the end of two weeks the birds that had received the best ration had gained more than 20 pounds per dozen. The cost per pound gain did not in any case exceed 6 cents and was generally nearer 5 cents.

We sold the birds to the same man we bought them of, at 15 cents per pound, although the price for springs had dropped half a cent. The difference paid was because of the improved quality. In round numbers the profit per bird over cost of feed was 25 cents. This was made in a western town of about 4,000 inhabitants and is a conservative figure. If situated near a large place, where quality brings a greater premium, the margin would naturally have been greater. However, if the farmer can by a reasonable amount of labor add $25 in two weeks to his profits in marketing 100 spring chickens, it is decidedly worth while.

Where the birds are kept in such confinement it is necessary to keep the coops, feeding troughs, and shed absolutely clean. If a contagious disease should be introduced it would have an excellent opportunity to sweep through the flock. The danger of disease, however, where the farmer raises his own birds and raises them right, is less than it is where one buys promiscuously. We found from our experience that it stimulates the appetites of the fowls to give them succulent green food, as young clover, two or three times during the feeding period. Grit and charcoal were also fed twice during the period.

The type of bird that has fattened best for us has been of the stocky short shanked, broad and deep bodied, wide, but short headed sort. The narrow bodied, long legged, crowheaded kind will not fatten well.

Charcoal for Hens.

There is nothing better to keep fowls in healthy condition than charcoal. Indeed it will astonish one not accustomed to feeding it to see the quantity the birds will eat, if it is kept where they can get it if wanted. It will keep their digestive organs in good working order and overcome in a great measure mistakes in feeding or over-feeding. A sour, hard crop and drooping head with purple comb is seldom seen where hens have charcoal. If there is any clearing of land burning charcoal may be procured there by drenching the fire with water as soon as it burned down to coals. These, broken to the right size, answer the purpose very well and hard-wood ashes in which are small pieces of coal from the fire are much liked by fowls. A shallow box filled with such ashes will materially decrease in a short time and seem to exercise the same power as charcoal.

Coal ashes are liked to dust in and fowls will eat the hard stony pieces of a size that they can swallow but they are not so healthful as charcoal or hardwood ashes. In buying charcoal get the coarse ground kind and place it where the birds can go to it at will. If the powdered kind is used it must be mixed with the mash and is not so nice to handle.

Chicks, if allowed to, will often eat too much and die of indigestion. This may be prevented by plenty of charcoal and sharp grit.

Lame shoulder is almost invariably caused by rheumatism of the muscles and yields quickly to the free application of Chamberlain's Liniment. This liniment is not only prompt and effectual, but in no way disagreeable to use. Sold by all dealers.

Poultry Fencing that is Stronger than Seems Necessary

We make our poultry fencing close enough to turn small fowl—then we make it extra strong, so it will last for years and keep the cattle out. The heavy, hard steel top and bottom wires hold it taut and prevent it from sagging.

PEERLESS POULTRY FENCE SAVES EXPENSE

It is well galvanized so as to protect it from rust. It makes such a firm, upstanding fence that it requires less than half the posts needed for the ordinary poultry fence, and that means a big saving to you. Write for particulars.

We make farm and ornamental fences and gates of exceptional quality. Agents wanted where not now represented.

Poultry Notes.

Kerosene oil is an effective remedy against lice, mites and fleas. Spray the house, runs and roosts occasionally with kerosene oil and these insects will give you no trouble.

Do not feed the little chicks with the other fowls. Provide coops or separate places for feeding the young chickens so that they will not be disturbed by the other fowls while eating.

Mineral matter in sufficient quantity to assist the growth of bones and to furnish material for eggs is essential for both layers and young chicks. Bone meal, ground oyster shells and crushed egg-shells will answer.

Are you keeping a record of the fowls this year? If not, begin now. Put your hens on a trial and give them a fair chance to a place on the farm. The farm is no asylum; it should not be required to support indigents.

Kitchen Scraps for Hens.

Keep every inch of bacon rind, meat refuse and gristle, as well as all other kitchen waste for the fowls. Where only a few hens are kept in town the kitchen waste is a big factor in the production of eggs. We have seen housewives burn the trimmings from their meat just to get rid of them. It made long to ask her if she didn't have a neighbor who would gladly carry them home for her chickens. Chop up your rinds for the hens. Never feed them whole, as they sometimes choke on them. Inch pieces can be handled nicely by an ordinarily active hen. On many farms attempts are still made to use up the meat scraps for the making of soap. A little figuring will show that it is worth more as a food for laying hens.

Chamberlain's Stomach and Liver Tablets will brace up the nerves, banish sick headache, prevent despondency and invigorate the whole system. Sold by all dealers.

Love's Barrier.

(Continued from last issue.)

She wiped the flour from her hands took off her large white apron, and crossed the hall to the study.

"I want you a moment, dear," he said gently. "Just close the door."

She did so, great,y wondering.

"I shall have to go away this afternoon, Jane, for a couple of days.

"You will not return till Friday? What takes you away?"

"I have to go to Colchester, in Essex, in consequence of a letter I received this morning from a person I met in Paris."

"It is a long journey from here to Essex. You will have to go to London first?"

"Of course I shall go up by the three ten, sleep in London, go down to Colchester to-morrow morning, and return on Friday. Will you go over to Iffley and get Thorpe to take the service for me to-morrow night."

"Yes, dear, I will," she replied readily enough, but, though her tongue was silent, her eyes were full of questioning and somewhat apprehensive.

"I shall get dinner half an hour earlier, and put your things together in the little bag. Is there anything particular you wish to take?"

He shook his head, and began to search his pockets.

"Money. I'm afraid. Do you happen to have two sovereigns in the house?"

Sovereigns were not plentiful in Midcar Rectory, but Jane was able to supply the need. About half past two Secretan departed, carrying his Saturday-to-Monday bag, after having bidden a somewhat strained good-bye to his sister. Both knew that a crisis of some sort had come.

Jane, watching his tall figure swinging down the road, felt a shadow creeping about her heart. Had her vague thoughts been crystallised they might have been expressed in these five words—"A woman in the case."

CHAPTER IIIf
THE ETERNAL ISSUE.

Secretan did not know Essex at all, and the first part of the journey from Liverpool Street disappointed and depressed him. London seemed to have no end, and the dreary rows of workmen's dwellings were not improved by the dripping fog which almost hid them from view.

But when they left the suburbs behind, and the train began to speed through a more delightsome land, where the sun did not disdain to shine, and sweet little country towns dotted the landscape, he was able to realize, in part at least, the Essex Constable had loved. By the time he reached Colchester he had decided that it was quite a worthy setting for the woman he loved. The woman he loved! Secretan had not yet admitted that portentous factor to himself, but in his heart there was a hidden sweetness which could have no other meaning, though he stoutly protested to himself that it was simply as a friend he had been called to Helen Revell's side; to redeem his promise made that memorable morning in the gradens of the Luxembough. He wore his clerical garb on this occasion, perhaps with the idea of accentuating the office of healer. He wore it well, too, with conspicuous dignity and grace, and was undeniably a handsome man.

A considerable number of passengers alighted at Colchester, and Secretan quickly learned that there was a short walk between the station and the town. In no way pressed for time, he made his way leisurely on foot, and, arriving at the High Street, was delighted with its quaint, old-fashioned appearance. The low, bow-fronted shops, the overhanging eaves of the houses, and the ancient landmarks here and there, filled him with interest and satisfaction. It was now half past twelve. He had not written to Helen, and, reflecting that it would perhaps be inconvenient to make a call at a strange house at such an hour, he decided to lunch first at "The Baldfaced Stag," an old-fashioned chop-house with a weather-beaten sign swaying and creaking in the breeze. Secretan, naturally a shy man, secretly shrank from seeking Helen openly at her own home, especially as she had not in so many words bidden him come. He felt himself in an unusual position, but after prolonging his meal as long as he dared he sallied forth once more into the busy High Sereet to find the number on the card.

A little farther up the shops came to an end, and dwelling-houses of a delightful old-world type took their place. He found ninety-six to be a tall, narrow house with many small windows, and a heavy oaken door, adorned by a large and rather terrible griffin knocker. The casement windows were swathed in soft yellow silk, which harmonized exquisitely with the subdued coloring of the walls and the dark woodwork, and gave the house an air of distinction. It had a cloistered look; one could not imagine a prying eye peering behind those close draperies; it suggested the life austere, individual, and apart.

He stood still, lifted the knocker, and let it gently fall, but immediately sonorous echoes sounded within. After a brief space the door was opened by a cherubic-faced page boy in brown livery, who waited with a charming air of friendliness to hear the stranger's business. Beyond him, Secretan caught a glimpse of dim recesses, softly lit, of rich carpets and pictures.

"Miss Revell?" he said inquiringly.

"Not at 'ome," replied the imp promptly.

"Do you mean that she is not in Colchester or merely not in the house?" demanded Secretan, in no mind to be treated so cavalierly.

"Not in the 'ouse, sir, not at 'ome till tea-time."

"When is that?"

"Depends on missis, but generally speakin', sir, it's about half past four. 'Oo shall I say 'as called, sir?" inquired the page anxiously.

"It is of no consequence, I can come back," replied Secretan as he turned somewhat disappointedly away. Repulsed by his reception, he wondered whether his visit might not be regarded as an unwarrantable intrusion. After all, Helen had merely asked his friendly advice, not his personal intervention in her private affairs. He walked rapidly away and when well out of range of the house he had left he drew a penny guide book from his pocket to discover what of interest he might see in Colchester while he waited. Since Helen was in the town, it would be obviously foolish for him to leave it without seeing her. But part of his enthusiasm was gone. He had decided to explore the old castle, and bent his steps towards the ground, through which the Colne, a placid, well-filled stream, meandered noiselessly. It was very quiet there, being November, there were no sightseers. So far as he could discern, he appeared to be the only person about. Taking advantage of the fact he drew Helen's letter from his pocket to peruse it once more, though he already knew it by heart. While

AFTER DOCTORS FAILED

Lydia E. Pinkham's Vegetable Compound Cured Her.

Midgie Station, N. B.—One can hardly believe this as it is not natural, but it was my case. For ten months I suffered from suppression. I had different doctors, tried different medicines, but none helped me. My friends told me I would go into a decline. One day a lady friend told me what your medicine had done for her, so I wrote you for advice and received your reply with pleasure.

I started taking Lydia E. Pinkham's Vegetable Compound, and at the second bottle showed improvement. Now I am regular and never was so well in my life, thanks to Mrs. Pinkham's medicine.

Please publish my letter for the benefit of others.—MRS. JOSIAH W. HICKS, Midgie Station, N. B.

Indian Head, Sask.—Lydia E. Pinkham's Vegetable Compound is indeed a boon to women who suffer from female ills. My health is better now than it has been in my five years of married life and I thank you for the good your advice and medicine have done me. I had spent hundreds of dollars on doctors without receiving any benefit.—MRS. FRANK COOPER, Box 448, Indian Head, Saskatchewan.

The most successful remedy in this country for the cure of all forms of female complaints is Lydia E. Pinkham's Vegetable Compound.

HELPS THE SICK TO GET WELL

A GOOD FRIEND TO GIN PILLS

If you want to know what GIN PILLS will do, ask anyone who has ever used them. Then you will learn the plain, unvarnished truth about the greatest Kidney Remedy known to modern science.

It is the enthusiastic praise of thousands who have been cured, which has done so much to make GIN PILLS known in every section of Canada.

The letter below is only one of many that show how GIN PILLS are regarded by those who have used them.

VANCOUVER, B.C.

"I think it my duty to tell you that GIN PILLS are a sure cure for Kidney Trouble and La Grippe. I suffered so much with my kidneys and La Grippe until I used GIN PILLS, and now would not be without them in the house. I shall always recommend GIN PILLS to anyone I know is suffering with their Kidneys."

MRS. M. BUTLER.

thus engaged, and oblivious of things around him, someone spoke his name.

He started confusedly, and there she was in front of him, a gracious and very graceful figure in a coat and skirt of homespun, her little hat pheasant's wing poised at a most becoming angle on her plentiful and shining hair.

"Mr. Secretan, is it possible! I could not believe my eyes at first. Have you actually come all this distance to see me?"

He answered quite simply:

"I came because of your letter. I thought it would be easier and probably more satisfactory, if we talked things over. Besides"— and now his eyes frankly devoured her looks—"I wanted rather badly to see you again."

She looked away suddenly, so that he did not catch her expression.

"You are not angry, I hope?" he said humbly. "Perhaps it is an intrusion."

"An intrusion! How can you say that? I was only thinking that, among all the people I know, there is not another who would have done as much for me."

"You are hard upon the world," he answered.

"No, merely just in this instance. But how long have you been in Colchester?"

"I arrived by the twelve thirty-five."

"And have you had any lunch?"

"Yes, I ate at 'The Baldfaced Stag', and afterwards called at your house, to be informed that you would not be at home till tea-time."

"That was right. Did you see any body?" she asked jealously. "Anybody, I mean, besides Bates?"

"No one else, if Bates is the page-boy."

She appeared relieved.

"Well, where shall we go now? Would you care to walk somewhere? The environs of Colchester are not very pretty. We are surrounded by the military roads."

"Can't we stay here? The air is astonishingly mild, and it seems very quiet."

"It always is just at this hour. We can follow the path. It goes some distance by the river. Tell me, were you surprised when you got my letter?"

"I was honestly glad, at least."

"But now that you have come I hardly know what to say to you. WhenI wrote two days ago I was exasperated, desperate, and the end of all things seemed to have come."

"So bad as that?" he asked. "The strain has lifted then?"

"Very little. Do you remember our talks in Paris—that one particularly about the superflous women, of whom I am one? Do you still hold the view that no human being is, or can be, superfluous; that we are all parts or units of a great plan?"

"Yes, I do hold that view," he answered, his face flushing at the idea that any words of his should have been remembered or cherished by her. "I am surprised that you should have remembered it."

"I forget nothing that happened in those days. As I told you, I have not so many friends that I can afford to despise the most sincere one I have ever met."

Secretan's face flushed anew, and his heart beat, but she appeared to notice nothing.

"It is astonishingly mild, as you say, for November and this is the thirteenth, I remember because it is my birthday. I am glad you came on my birthday. It is the best thing that has happened on it so far."

"Your birthday!" he repeated. "I wish I had known."

"I am glad you did not; I don't particularly welcome birthdays now. This is my twenty-ninth."

"It is impossible to believe you twenty-nine," he said uttering the commonplace with the earnestness of conviction.

"It seems quite possible to me. To-day, I assure you, I feel many years older than twenty-nine."

"That is because you are brooding over some real or imaginary trouble."

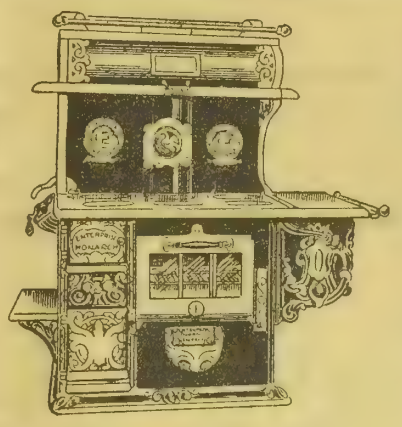
"I have no imaginary troubles; all mine are real," she said sharply.

"Tell me some of them. If I can

TRIED AND FOUND "NOT WANTING" IN ANY PARTICULAR

That's the verdict of hundreds of housekeepers who are using the

ENTERPRISE MONARCH STFEL RANGE.



Convincing evidence of this is found in the fact that the sales have doubled in a very short time and we have been compelled to greatly increase our manufacturing facilities to supply the demand.

There must be a reason for this, and to put it briefly, it is on account of the superior excellence of the MONARCH.

1820 Duncan Street, Toronto.

help you, I will. It is what I have ome for."

"I wonder whether I dare! Heavens, what a relief it would be!" she ried passionately. "My chief object in writing was to ask whether you knew of any markee where my feeble qualifications would command a price. Listen, and you shall hear them. I am a good needlewoman; I can play the piano, sing passably, and make a few daubs with a brush. The only thing I can do really well is to keep house on limited means. I have inherited from my mother a sort of sixth sense which enables me to get the best possible value out af the most meagre materials. Do you know of any market for these wares?"

She smiled upon him a little mockingly, and observed actually for the first time how handsome he was.

"I want to hear first what has led up to this. If you grant me the rights of a friend, I may ask first what has happened to carve those fresh lines about your mouth?"

"Are there fresh lines? My stepmother is always insisting on my passe looks. Life—the life she and I share together—has suddenly become impossible; that is all."

"Life seemed intolerable to me when I got back to my parish," he said unexpectedly. "But I have lived it down."

"Ah, you are a man, and master of your fate!" she said bitterly. "Listen, and I will tell you my story. It will not take long, I promise you, and it is only by having patience to listen you will be able to understand."

"My father was a soldier," she began after a moment's pause; "and I have spent all my life in garrison towns. I was actually born in India, however, where my mother died when I was four years old. I never missed her; my father was more than ten mothers to me, and I was the happiest girl in the world until I was eighteen. We went for a trip abroad that year. My father's health needed bracing after his long Indian career, and we went to Les Avants for a couple of months. Do you know Les Avants?"

"No, I have never been in Switzerland."

"Well, it was there the tragedy of my life took place, at least the beginning of it; it was there we met the woman who wrecked my happiness, who got my father in her toils, and finally induced him to marry her. He was a brave soldier, but he was a very simple, high-minded gentleman, with old-fashioned, chivalrous ideas about women, and he had no chance against an adventuress. She was very pretty, with the helpless, appealing ways that attract men of a certain type, but after marriage she altered and the misery began. She imagined, because my father was Colonel Revell, that he must be a rich man, and when she found how actually poor we were she was furious. She simply lived her own life, made a lot of talk in the regiment with her flirtations with other men, while at home she was nothing more than a nagging demon, who drove my darling to despair. I was glad when he died. I believe he was worn out with the strain. I could not go into details of those seven frightful years. I remained at home because I was the one comfort in my father's life. When he died Mrs. Revell affected to be very sorry for the past, and begged me not to leave her. I had no resources other than the small income I mentioned to you, and by joining forces we just managed to keep on the old house and to make a decent appearance. I had to take a share in the lease, so that I have been fast

SEND FOR OUR FREE BOOK

THIS book explains fully the scientific principle on which this wonderful machine is constructed, and describes completely the process of butter making by aeration. It tells about the old methods of butter making and the time and money saved by this new process.

THE "ONLY" WAY

is the name of this book. The book is so full of information to the practical farmer and dairyman and contains facts so new and startling that you have got to read it if you want to keep abreast of the times. The information in it is worth actual money to any man who owns even one or two cows —and more money, the more cows you own. We will send it free as long as the edition lasts. Simply clip and sign the coupon—to-day.

USE THE COUPON

YOU Can Have Butter 15 Minutes after Milking !

THAT statement sounds exaggerated. It is not; but the mere fact that it does sound so indicates to what an extent The "ONLY" Butter Separator has revolutionized the art of butter-making. When you use this machine, there is no neen for a cream separator or churn, no souring of cream and no long, laborious process. The whole operation is simplicity itself; you simply pour the sweet, whole milk, at a temperature of 72 degrees, into

The "ONLY" BUTTER SEPARATOR

turn the handle and in five minutes, or less, you have rich, beautiful, granular butter—free from casein and with perfect keeping qualities. Moreover, the skim has absolutely all the total solids, except the butter fat, left in it, and represents the highest type of stock feed. The "ONLY" Butter Separator costs but $38—figure that against the price of a churn and cream separator. Remember, we have no salaried agents, but if you will write to us we will tell you about our special introductory offer and special discount to bona fide farmers.

THE LOCK CAN'T SLIP

MARITIME WIRE FENCE

The illustration demonstrates the phenomenal gripping-strength of our lock. Under the most unusual strain it never gives. It is known as the lock that can't slip; the lock that unfailingly holds the wires in their correct position.

Our Free Catalogue will tell you more about our can't-slip lock, and about the superior English high-carbon, hard-drawn steel wire from which Maritime Wire Fence is made. Address the card to

New Brunswick Wire Fence Co., Limited, Moncton, New Brunswick

bound. It has been a horrible life. We have no tastes in common, her friends are not my friends, and the set she has about the house keeps nice people away. I have tried to do my duty by the children, to be patient, tolerant, charitable. Do you follow me?"

"I follow quite. What you ought to have done was to have separated when your father died."

"Yes," she answered with a sigh. "One realises things too late; but reflect on my microscopic income and my meagre accomplishments! Besides the old home was dear to me. Pride dies hard in the Revells. I could not bear to go out into the world like that. I am wiser now."

"How long has this unbearable condition of things lasted?"

"It will be three years next month since my father died."

"And now you feel that the arrangement must come to an end.?"

She was silent a moment and he observed her brave, sensitive mouth quiver. Her face had paled since they sat down, and her eyes were darkly shadowed.

"I have not told you everything. If your patience is not exhausted, I am coming to the reason why I must get away from my life here. Soon after my father died, a new regiment came to Colchester. As you do not know the life of garrison towns, you don't understand what a flutter the event makes in dovecotes, what possibilities are suggested, what hopes raised in expectant breasts. Among the newcomers was a man called Captain Hunt, who had an introduction to us from his aunt, Lady Arabella Hunt, who, before her marriage, had been a friend of my mother's. He was made very welcome, and became a constant visitor; in fact, every spare moment of his time was spent with us. Mrs. Revell thought at first he admired her; she is still a very pretty woman, looking younger than I, and her widow's dress gives her in the eyes of some a particular charm. But I knew that it was me he came to see.

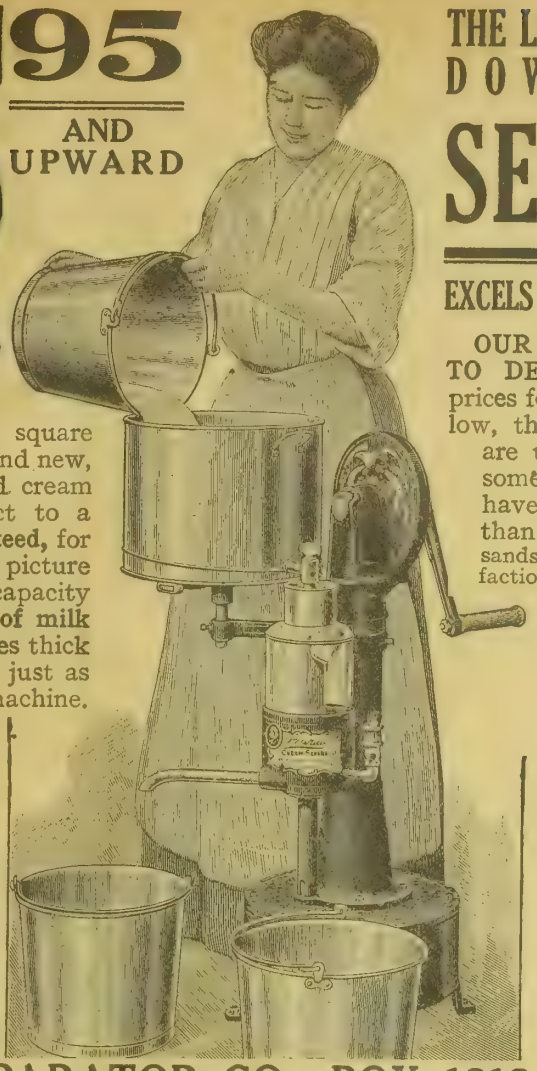
Her voice dropped to a lower key, and a grey pall seemed to settle swiftly on Secretan's heart. Somehow he had not expected this, and for the moment there was something that was not sympathy in his eyes. But she had apparently forgotten or become indifferent to the effect she might produce. The whole woman was changed, her being instinct with the memory of the passion which had wrecked her life.

"I must tell you I have never been popular among women. I was brought up by men, and was always more at ease in their company. I liked Captain Hunt from the first day I saw him, and very quickly our friendship deepened into something warmer. I knew he loved me, though he often deplored his poverty, and said his circumstances would necessitate his marrying a rich woman. I only took it as a jest. For more than a year we were all the world to one another, pledged by every vow of constoncy, and I would have gone to the world's end for him, or Rith him, without a question or a doubt. Looking back, now, I know how selfish he was all through; he did not care how people talked, and he was never careful as a good man is over the reputation of the woman he loves. I think I told you something of the lying and the cruelty of a garrison town. I suffered from it to the full, and had, besides, my stepmother's persecution in the background. I was only able to bear it because I was sure of Captain Hunt's love, and looked forward to the day when I should be his wife, and he would take me away from it all. Well, I am too long; let me hasten on. One day the bomb came. The

$15.95 AND UPWARD

THIS OFFER IS NO CATCH

It is a solid, fair and square proposition to furnish a brand new, well made and well finished cream separator complete, subject to a **long trial** and **fully guaranteed,** for $15.95. Different from this picture which illustrates our large capacity machines. Skims **1 quart of milk a minute,** hot or cold; makes thick or thin cream and does it just as well as any higher priced machine. Any boy or girl can run it sitting down. The crank is only 5 inches long. Just think of that! The bowl is a sanitary marvel, **easily cleaned,** and embodies all our latest improvements. Gears run in anti-friction bearings and thoroughly protected. Before you decide on a cream separator of any capacity whatever, obtain our $15.95 proposition.



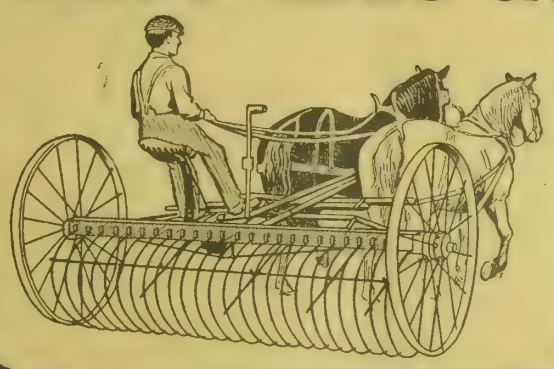
THE LOW DOWN AMERICAN SEPARATOR

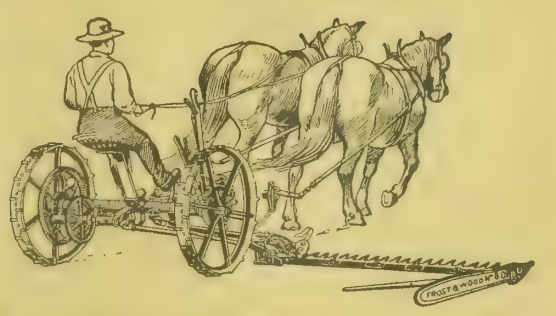
EXCELS ANY SEPARATOR IN THE WORLD

OUR LIBERAL TRIAL ENABLES YOU TO DEMONSTRATE THIS. While our prices for all capacities are astonishingly low, the quality is high. Our machines are up to date, well built and handsomely finished; run easier, skim closer, have a simpler bowl with fewer parts than any other cream separator. Thousands of machines in use giving splendid satisfaction. **Write for our 1911 catalog.** We will send it free, postpaid. It is richly illustrated, shows the machines in detail and tells all about the **American Separator.** Our surprisingly **liberal long time trial** proposition, **generous terms of purchase** and the low prices quoted will astonish you. We are the oldest exclusive manufacturers of hand separators in America and cannot afford to sell an article that is not absolutely first class. You save money by dealing with us and at the same time obtain the finest and highest quality machine on the market. Our own (manufacturer's) twenty-year guarantee protects you on every **American Separator.** We ship immediately. **Cream separators are admitted into Canada free of duty.** Write us and get our great offer and handsome free catalog. ADDRESS,

AMERICAN SEPARATOR CO., BOX 1212, BAINBRIDGE, N. Y.

Save time at haying time





Next season outfit yourself with a Frost & Wood hay outfit—a Giant Eight Mower and a Tiger Auto-Dump Rake. You will then have a haying equipment good for a lifetime's hard service—one that will save time at haying time, save you buying repair parts, and save a big slice of its cost yearly in reduced work for horses and men too.

Built to Outlast the Men who Buy them

This Mower makes a 6-foot cut easier than others cut but a 4-foot swath. Plenty of roller bearings help it to run smooth, insure long life, reduce wear to the minimum. One owner has worked his Frost & Wood Mower hard every season for 20 years—and bought but ONE REPAIR PART in all that time. Reinforced Cutter Bar protected against wear by guard-shields behind the knives; Pitman ends of toughened forged steel; large bearings on hanger—not usual pins—allow cutter-bar no play and cannot wear down. Tiger rake has as many good points as No. Eight mower. 64

The Frost & Wood agent near you is a good man to know. Visit him.

Glad to send you a bookful of money-saving facts and proofs if you'll request Catalog B13 from FROST & WOOD CO, LIMITED, SMITH'S FALLS, CANADA

Frost & Wood Giant Eight Mower Tiger Auto-Dump Rake

is that housekeepers try to do too regiment was ordered to India, and would you believe that, leaving before his company, Captain Hunt did not even bid me a personal farewell? He wrote a hurried letter from Southampton on the eve of embarkation, bidding me good-bye, regretting that it must be an eternal one, and hoping I would forgive him for any pain he might have caused me, and that I would find someone worthier of me. You know the sort of letter a man like that can write to a defenceless woman."

Secretan leaped to his feet, and clenched his strong right hand, but Helen proceeded as if unaware of the interruption.

"It made a good deal of talk, of course, and I was under a cloud. I am under a cloud still. My stepmother did not help me at all. Her reproaches have sometimes driven me almost to the verge of desperation. And now it appears there is a chance of a second marriage for her, and she has indicated to me very plainly that she will be glad when I leave the house. She never knew just how I stood with Captain Hunt. She keeps on as if I had lost him through some stupid fault of my own."

"How bad it has been for you to live with that woman so long!" exclaimed Secretan. "That has been the grand mistake."

"Realized too late," she admitted. "We hate each other as only women can hate," she added with a faint, melancholy smile. "And now there is not even the semblance of courtesy between us. It is open warfare. You see, a greae part of the things in the house belongs to me, my mother's silver, and some of the best furniture, which my father prized and left specially to me in his will. She says I can have nothing. But I see you are wearied with this sordid tale, and I will come back to the main issue. Where am I to go? Tell me what to do?"

Secretan walked away from her for a few paces, appearing to ponder deeply. Watching him idly, she admired his fine figure, his manly air, and was strangely comforted by the idea of his strength. He was not one to leave a woman in the lurch; his nature, as well as his calling, would make him kind, helpful and sincrer.

Presently he came back and xtood directly in front of her, a little pale, his face set in newness of purpose. Whatever counsel he had taken with himself appeared to be final.

"You said to me once in Paris, that I was one of the few who could befriend a woman without the eternal issue coming between, but you were wrong. I am just like other men. I love you. I want you. I have not been able to do my work for thinking about you. Will you be my wife?"

(Continued next issue.)

Woman and Home.

Many a woman feels like chanting "the melancholy days have come, the saddest of the year," when she glances around her house these days and sees the disorder attendant upon house-cleaning. That this clearing away of the dust and dirt accumulated during the winter months is necessary to health and comfort has long been admitted even by the easy going housekeeper who would il she could shirk the trying task. But house-cleaning like other labors, is greatly lessened by system. How many houses there are where every room seems to be undergoing the cleaning process at one and the same time! There is not a room where one may sit down in comfort, on the contrary disorder and confusion are everywhere in evidence. The trouble is that housekeepers try to do too much at once; they like to work day and night almost until every room is finished and then they are ready for a case of nervous prostration. There is a happy medium, however, and it is well to take it. Have all the help you can afford, work carefully, but not with a feverish energy that soon wears out every nerve, and stick to "union hours." In other words don't overdo, just for the gratification of getting through a bit sooner. For when your nerves are worn to a frazzle, your temper gives way, and everybody suffers.

In house-cleaning, as in everything else, th?re is a sensible way, as well as a foolish one, and since it is unfortunately true that houses must be cleaned, it is well to try and accomplish the work with as little fret and worry and waste of energy as possible.

If I Knew.

If I knew the box where the smiles are kept,
No matter how large the key,
Or strong the bolt, I would try so hard,
'Twould open I know, for me.
Then over the land and the sea, broad-cast,
I'd scatter the smiles to play,
That the children's faces might hold them fast
For many and many a day.

If I knew a box that was large enough
To hold all the frowns I meet,
I would like to gather them, every one,
From nursery, school and street.
Then, folding and holding, I'd pack them in,
And turning the monster key,
I'd hire a giant to drop the box,
To the depths of the deep, deep sea.

Cook Pork Thoroughly.

Trichinosis is a disease that has been known for a long time in Europe, but that has been little heard of in Canada. It has, however gained a foothold in America, and cases of it are coming to the attention of the medical profession. This is sufficiently the case that the U. S. government has just issued a bulletin dealing with this trouble.

The cause of this disease is the presence in the human system of a microscopic parasite commonly known as trichina or flesh-worm. It has been proven in the U. S. that an average of one or two per cent. of the hogs slaughtered in that country are infested with this parasite. When transmitted to human beings, trichina may cause serious illness, some times resulting in death.

The proper preventive measures to guard against trichinosis in the human family is to see that all pork is properly cooked. A temperature of about 160 degrees kills the parasite, therefore pork may be eaten without any danger of infection. Fresh pork should be cooked until it becomes white and is no longer red in color in all portions of the piece, at the centre as well as near the surface. Dry salt pork, pickled pork, and smoked pork previously salted or pickled, providing the curing is very thorough, are practically sare so far as trichinosis is concerned, but as the thoroughness of curing is not always certain, such meat should also be cooked before it is eaten.

Chamberlain's Cough Remedy is sold on a guarantee that if you are not satisfied after using two-thirds of a bottle according to directions, your money will be refunded. It is up to you to try it. Sold by all dealers.

The Woman's Part.

There are many problems connected with the farm and farm life, but none of them is of more vital importance than the problem of the farmer's wife, her position upon the farm and her relation to its management. Just how much of the work on the farm the wife should take upon her shoulders in addition to taking care of the house and preparing the meals, is possibly a question that never will be settled, and never should be settled except by each individukl and for individual cases.

Perhaps most of those who read this will say that the whole question is nonsensical, for the farmer's wife is not expected to do any of the farm work. Perhaps most farmers think that the wife does not do any farm work, but is it not a fact that when the wife is taking care of the poultry, working in the garden, feeding the pigs or helping to pick peas or berries for the market, she is doing actual farm work? The premises being well settled, therefore, we can look at the subject in better light.

It is very probable that many, perhaps most farmers' wives like to do some of this work for the real profitable assistance they may be in the struggle to make the farm pay, and in this they are to be commended. If the wife is physically strong, is not only able but willing and anxious to do some of the work about the farm, there are often many things that she can do as well or better than any of the men folks, but the amount of farm work which she does should be graduated to correspond to the amount of responsibility that she has indoors.

The great mistake is often made in looking upon a certain class of farm duties as being essentially the work of the farmer's wife. For instance, it has been pretty generally understood on the average farm that the handling of the milk, from the time it left the barn, was the work of the housewife, whereas, if butter, cream or cheese forms any part of the income of the farm, the handling of those products is really a part of the farm work.

The care of the poultry from the time the old hen is set upon her thirteen eggs until the marketable eggs or dressed poultry are ready to be taken to town, is in many places looked upon as the woman's work. Not infrequently the care of the farm garden or berry patch devolves upon the farmer's wife. Maybe the farmer plants the garden and gives it some cultivation with the hoe or other implement, but how many cases there are in which this part of the farm work would be neglected at extremely critical times if it was not performed by the wife. How often the garden would quickly become a tangle of weeds if it was not kept clean by the woman of the house.

The average farmer's wife is an energetic, industrious, and as anxious for the success of the whole enterprise as the farmer himself, and there are a great many of these things that it is often possible for her to do and do well, and which she will enjoy doing if she has the things convenient to do with and if the job is not made too big. The mistake that is usually made in such cases is in considering some such works as these an essential part of the duties of the housewife, and allowing them to be neglected if she does not attend to them. —Maine Farmer.

Method and Rate of Seeding

(Continued from page 637.)

Probably the best method of sowing alfalfa seed is with a drill, as by this means it may be covered most uniformly. When a nurse crop is sown with it, as in the case of spring seeding, the alfalfa seed should be put into the grass seed attachment and dropped ahead of the drill shoes. In the case of summer seeding, without a nurse crop, drilling the same as wheat, with the drill set to run as shallow as possible, will usually be best. If the drill cannot be adjusted to sow small amounts, enough coarse corn meal may be mixed with the alfalfa seed to increase the quantity so that the drill will handle it properly. When drilling is not convenient, the seed may be sown broadcast and lightly covered with a harrow.

The rate of seeding should be about 20 pounds per acre.

Minard's Liniment Co., Limited

That Heifer Calf.

So much has been said about the opportunities for the increase of the dairy interests and the opportunities for the making of profit in raising stock of all kinds, that it seems as though every farmer would by this time be impressed with the thorough advisability and wisdom of raising every heifer calf which is dropped this spring.

It is a well-known and much lamented fact that there has been a great decrease in the number of dairy cows in the past few years. The reasons for that decrease probably do not exist any longer. It is also well-known that a great many farmers would like to buy more dairy cows if they could find them to buy without paying the fancy prices that the owners of pure bred stock want.

Of course, the breeders and owners of pure bred stock can sell and do sell all the stock they can raise, at fancy prices, so that even if the ordinary farmer was able or willing to pay these prices for his working stock the situation would not be relieved, because only a comparatively few of such animals are available. They are being purchased for the purpose of laying the foundations of herds or improving existing herds.

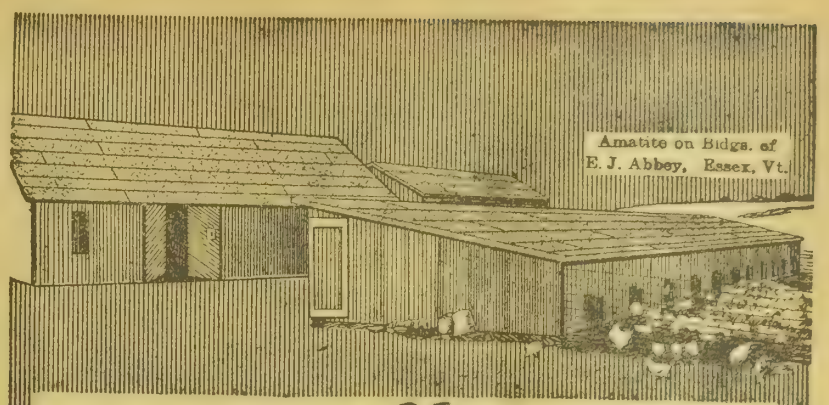
We all know that there are some cows which cannot make a profit in the dairy herd, and there may be some reason for thinking that it would not be profitable to raise all the heifer calves which are dropped, but, on the contrary, it is likely that the calf which is dropped from the cow which the dairyman has found it advisable to keep, will make as good a cow as its mother, and if it is sired by a good pedigreed bull of the dairy type, it will be likely to make a better cow. A heifer whose pedigree and ancestry record gives promise of dairy ability can always be sold for a large price, even before it has had the opportunity to make good.

There is no doubt that it is and will continue to be profitable to raise veal for the home market; and not every man who raises cattle wants to be in the dairy business. The men who are in the dairy business, however, should not allow the butchers to get possession of any of the little heifer calves which some day should have the chance to prove the wisdom of their raising.

It would seem to be necessary only to hint at the wisdom of the dairyman's raising his own heifers to have it recognized and accepted, for it is an open secret that a good dairy cow, one that will make a profit for its owner, is mighty hard to find. The dairyman who sells whole milk will, of course, hesitate before using any of his milk product for the purpose of raising heifer calves, but there are many milk producers who believe that it is wise to take enough of the milk that would otherwise be turned into immediate money to give the bossies a good start into the world and gradually, as soon as possible, change them over to some of the approved methods of raising by hand.

There are methods of feeding calves to be raised for dairy cows which eliminate milk, except in small amounts, and some of these methods have been used by milk producers who wish to raise their own heifers without being required to use the milk which is their regular source of income. It would seem to be the height of extravagance for the milk producer to dispose of all his heifer calves, because he does not wish to use the milk that would be necessary for the first few weeks of their babyhood, and then, at the time when the calf should be a producing cow, pay probably a hundred dollars for an animal which perhaps would not be as profitable. The entire amount of milk that would be necessary for the first part of the little animal's life could be worth only a few dollars at the most.

There will be various opinions on



Amatite ROOFING
Needs No Painting

TRADE B MARK

AMATITE *roofing is weaned.* It doesn't need to be watched over and fussed with and cared for.

It takes care of itself from the start. As soon as it is laid on your roof, you can go away and forget about it.

You *don't have to paint* Amatite every two years as you do the "rubber" kinds. Amatite has a mineral surface which needs no painting.

The mineral surface is better and more durable than many coats of paint.

Back of the mineral surface is a layer of pitch, the greatest waterproofing compound known. Back of the pitch is a layer of felt (a whole ready roofing in itself), and behind this is another layer of pitch and another layer of felt. The result is a strong, durable roof which can take care of itself in any climate without painting.

We will be glad to send you free a sample of Amatite Roofing so that you can see for yourself just what it looks like.

Address our nearest office.

Everjet Elastic Paint
Low in price. Great in durability. Invaluable for prolonging the life of ready roofings, fences, iron work, etc.

Creonoid Lice Destroyer and Cow Spray
It will keep flies away from the cows. It will keep lice and nits away from the poultry, make everything sanitary and increase their output.

It is one of the best propositions ever offered to a farmer who wants to make money during his spare moments.

Write to-day for particulars as to territory, etc

The Acme Steel Ladder Co.,
Sussex, N. B.

Cost of a Boy.

I have recently seen figures which go to show that it costs at least $25,000 to carry a boy up to the time he is capable of earning his own living! This seemed to me absurd until I was told by several well-to-do people that the figure is probably too low. There are many of us who probably cost their parents less than $500. With my experience and knowledge of human nature, I should say that one of the quickest ways to ruin my boys would be to spend $10-000 in fitting them to be self-supporting. I am told by those wealthy men that from infant food to graduating suit, their sons multiply their own original cost by 10. One of my boys had trouble with his teeth and went to a dentist. Supposing that "the old man" was back of the job the dentist named a high figure for the gold work. The boy spoke up and said: "Now, I must pay for this with money earned by my own labor. If a cheaper metal will do for the present, what will that cost?" The dentist "looked again" and said—$10. The boy comes to me for a job to earn the money and I shall give it to him. He will take better care of his teeth if the price means crystalized sweat, and he can not begin too early in life to realize the value of a dollar. Some of these $25,000 beauties may come to be great men, but I would rather have muscle than money back of them. I have had a good business man tell me that he could hire plenty of college bred men at $10 or $12 a week, and expensive at that. I have had rich men tell me that they would give half they are worth if their could only be obliged to struggle as they had to 30 years or more ago. When I saw these pampered and over fed young sprouts, I knew just how the old gentlemen felt; but with all their nerve and success, they didn't have the courage to give their money away and put the boy on a working basis. What did it cost to raise you and put you on a self-supporting basis, and what does it cost you to put your boy or girl in a similar situation?—Rural New Yorker.

To Fold Men's Clothes

This is not an easy task, and if badly done, the garments present a creased appearance when unfolded. For trousers, place the two innermost buttons on the top of each other, when the trousers will lie flat. Double them from the lower end upwards, and if then too long to fit the trunk or suit case, fold the legs in two, not inwards, but outwards. Coats must have the collars turned up before being folded, as this precaution prevents an ugly crease. Place the coat inside downwards, and fold the sleeves in two towards the shoulders. Then fold the coat, shoulder to shoulder, then double it once more from the lower end to the collar. Frock coats are treated in the same way, but folding the coat over from the lapels down over the sleeves before doubling the first time. The tails are folded up towards the collar, before folding for the last time.

"It cured me," or "It saved the life of my child," are the expressions you hear every day about Chamberlain's Colic, Cholera and Diarrhoea Remedy. This is true the world over where this valuable remedy has been introduced. No other medicine in use for diarrhoea or bowel complaints has received such general approval The secret of the success of Chamberlain's Colic, Cholera and Diarrhoea Remedy is that it cures. Sold by all dealers.

CONSTIPATION

CURED BY THE USE OF

MILBURN'S

LAXA-LIVER PILLS

Constipation is one of the most frequent, and at the same time, one of the most serious of the minor ailments to which mankind is subject, and should never be allowed to continue.

A free motion of the bowels daily should be the rule with every one who aspires to perfect health.

Mrs. Fred. Hall, 299 Hibernia Road, Montreal, Que., writes:—"Having been troubled for years with constipation and trying everything I knew of, a friend advised me to use Milburn's Laxa-Liver Pills. I used four and a half vials and I am completely cured. I can gladly recommend them to all who suffer from constipation.

Milburn's Laxa-Liver Pills are 25 cents per vial, or 5 vials for $1.00, at all dealers, or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

"IDEAL" CONCRETE BLOCK SILO

On the Massey Farm East Toronto

Erected at Dentonia Park Farm for Mrs. E. D. Massey. 34 feet high—15 feet diameter—capacity 180 tons. Built of "Ideal" Blocks.

Farmers, all over Canada, are eagerly taking up Concrete Blocks for all kinds of farm buildings.

Besides being fireproof, waterproof and verminproof, Ideal Concrete Blocks are the cheapest of all permanent building materials.

An Ideal Machine will more than pay for itself on the first house, barn or silo you build.

Write us for full particulars—catalogues free on request. 10

Dealer in Meat, Poultry, Produce, etc. All consignments carefully attended to and returns are promptly made as soon as goods are sold.

If you are not satisfied after using according to directions two-thirds of a bottle of Chamberlain's Stomach and Liver Tablets, you can have your money back. The tablets cleanse and invigorate the stomach, improve the digestion, regulate the bowels. Give them a trial and get well. Sold by all dealers.

A Moth Preventative

The season will soon be with us when winter clothing, woolens and furs must be stored, and this is recommended, says The Commoner, for their protection: A cedar chest is best, but if you have no cedar chest, and have access to cedar trees, try this: Sun, brush, beat and shake well everything that cannot be washed. See that all grease or oil spots are removed, as moths love grease spots. Wash cleanly and carefully all washable articles, to remove all dirt and have these perfectly dry. Strip from the cedar trees the young twigs and green pickl?s called leaves; put them into thin muslin or cheese cloth bags and have plenty of them; you will want quite a lot. Then, into the bottom of your trunk, or chest, put a layer of the cedar trimmings, and lay over this a strip of cheese cloth, then put in your garments and wollens, and distribute the little cedea-filled bags plentifully among the folds and lay over the top another strip of cheese cloth, and pile the cedar chippings tightly on that; then close the trunk tightly and moths will hardly seek the inside.

Bleeding and How to Stop It.

Many a mother has had a terrible fright by a child running in with its clothes, hands and face all smeared with blood. It is astonishing what a mess a child will manage to make with a little blood. You will find, most probably, when you have washed it with cold water that the amount of injury is a mere trifle. It is difficult to stop the bleeding, a most valuable remedy is the common whiting or pipe clay.

Put a thick covering of either of these on the wound, then a bit of dry lint, and press it closely for a few minutes. Let what sticks to the wound remain there, and cover with a bit of plaster.

Bleeding from the nose, unless it goes too far, need not alarm you; nay, in many cases it may prevent something much more serious: but when it requires to be stopped, let the child sit upright, bathe the neck and face with cold water, and dissolve a little alum in water, and squirt it up the nostrils. If this does not succeed send for the doctor.

Brushing a Garment.

In brushing a garment that holds lint and dust place it upon the ironing board and sweep it with the whisk broom, always in the direction of the weave, which should be from the band to the hem. Even this process will not always insure a perfectly clean skirt, for the broom and brush scatter dust particles, but you will meet with good results by going lightly over the goods with a dry sponge. This sponge will take up all pieces of lint. It can be used to brush the collar and cuffs of a coat and is very convenient for dusting dandruff from a man's coat collar.

To Paper Room With Low Ceiling.

When the ceiling is low—not more that eight and one-half feet—wall paper should not have a border, nor should the ceiling paper be brought down on the sides. It would be best to keep the walls plain, without moulding an inch wide, at the top, dado or plate shelf, and use picture in the angle.

Anchor SHINGLE STAINS

The Best Preservative of Undressed Wood

Anchor Shingle Stains indefinitely postpone, if not absolutely prevent wet or dry rot. They show up the grain of the wood, giving delicately artistic finish, not only to the surface coated, but to the entire building.

We have used infinite pains in the selection of pigments best suited to combine with our specially treated **COAL TAR CREOSOTE,** and our success has been proportionate with our care.

Anchor Shingle Stains are being very largely used on the roofs, and in many instances also on the bodies, of the most attractive houses in our midst; they are also employed with excellent results from an economic standpoint on sheds and other outbuildings.

If your dealer cannot at the moment supply Anchor Shingle Stains, please write us to arrange for you.

BRANDRAM-HENDERSON LIMITED

Standard Wire Fence

In the "Standard" Wire Fence, you get the durability that comes with strength. Made of all No. 9 Hard Steel Wire, well galvanized—which means no rust and long wear.

"The Tie That Binds" hooks on the running wire and locks smooth on both sides.

Then—there's the Standard Steel Fence Posts that hold the wires without staples—won't rot and are very durable.

We make a specialty of Galvanized Gates, too.

Our new books are chock full of fence facts. Write for free copies and sample lock.

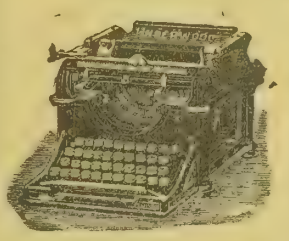
THE TIE THAT BINDS

17

Before. After.

Why Every Breeders hould Have a Typewriter.



After working hard all day in the stable, the field and in the woods, the average breeder goes home at night to find mail waiting him that demands prompt attention. Your hands are naturally calloused and you would rather handle a pitchfork than a pen. If you had a Typewriter you would find it much easier to manipulate. The key board, showing letters plainly, is very simple. It may take a little longer at first to write your letters, but you can "speed up" with little practice. Then again, a Typewriter is better in a home where there are growing children, especially girls, than a piano. If they learn to operate it will not take nearly so long for them to get through business college if they know the use of a Typewriter. Right here is where you will probably save the cost of a machine. They last a lifetime with care and the fact that your correspondence is written on a Typewriter will give give you a standing with prospective buyers that cannot be obtained in any other way. We have lots of new machines ready to ship and have several second hand ones that have been rebuilt. If you are interested write for further information with regard to cost, etc., mentioning The Maritime Farmer.

United Typewriter Co., Ltd..

Prince William St., - St. John, N. B.

the question of whether it is wisest for the farmer to raise or buy the cows for his milk dairy, but it is probable that all the argument for economy will be found to be on the side of the home raised heifer.—Maine Farmer.

Water Cooling vs. Air Cooling.

There are yet many milk producers who seem to think it unnecessary to set the milk in water for cooling during the winter when the air is cold,forgetting that the water transfers the cold much better than does the air.

At a dairy school, Daleum, Denmark, Instructor K. Jensen demonstrated, first as to the development of bacteria, that when the freshly drawn milk had 1,400 bacteria, it would, if kept for eighteen hours at 48 dgs. F., have 2,100; at 54 drg. F. 5,600; at 59 dgs. F. 156,000; at 64 dgs. F. 500,000 and at 70 dgs F. 6,750,000 bacteria.

With the temperature of 49 in water and 28 in the air, the morning's milk was 87 dgs. F.; the same in both at noon but at 2 p. m. that in water was 52 dgs. F. The next two hours with wattr of the same temperature while the air was 32, the milk in water had dropped to the temperature of the latter 49 dgs. F., while that in the air was only cooled to 61 dgs. F.. The next morning that in the milk was yet the same temperature as the water which had dropped to 48 dgs. F. and that of the milk in the air was finally of the same temperature as the air (40 dgs. F.)—J. H. Monrad, Denmark.

Rhubarb.

Rhubarb Pudding No. 1.—Place a layer of rhubarb in the bottom of a baking dish and sprinkle it thinly with sugar and grate on some nutmeg, then a layer of bread cut up, the same size of the rhubarb, and so on until the dish is full; then beat up the yolks of two eggs, half a cupful of sugar, one pint of milk, flavor with nutmeg and pour over all; bake until done; beat up the whites of the two eggs, frost the top of he pudding and brown it lightly. Delicious.

Rhubarb Pudding No. 2.—Wash and cut into inch pieces enough rhubarb to fill a three-pint pudding dish. Mix half a nutmeg, grated and three cupfuls of sugar; butter the dish quickly with cold butter, put in a layer of soft bread-crumbs, then a layer of rhubarb, then a layer of the sugar, with a tablespoonful of butter cut into little bits; repeat these layers, having a thick layer of breadcrumbs at the top, in which a little butter is mixed. Bake about an hour, slowly at first. To be served hot or cold as one prefers. Serve with hard sauce: —One half cupful of butter well beaten; stir in slowly one cupful of fine sugar and beat to a cream. Put on a small dish, grate a little nutmeg over it and keep cool.

Rhubarb and Fig Preserve.— For this take 3 lbs. of rhubarb, 2½ lbs. of sugar, ½ lb. of figs, and 2 ozs. of candied peel: wipe the rhubarb, cut it into inch lengths, and place on a large dish. Chop finely the figs and candied peel and scatter them over the rhubarb: lay on this the sugar and stand till next day. Boil the preserve slowly for an hour or longer if necessary, adding a small piece of ginger for half an hour.

Stewed Rhubarb.—Peel the rhubarb, cut the stalks into small pieces and place in a granite stewpan. Add sufficient water to cover the rhubarb or nearly, and allow a cupful of sugar to each pint of rhubarb. Stew until tender and serve cold.

Care of the Eyes.

Teachers and parents should watch children when reading and studying Is the book held close one moment and away the next? Do they wink often and rub their eyes? Do they stumble along in reading? Do they turn from side to side to catch the best light? Do they complain of their eyes at night? Are the pupils of their eyes large? Do they suffer from severe headache while attending school or after reading for some time which is not relieved by usual means? The eyes may look clear and natural as any, yet there may be malformations in shape of the balls. Question them closely and while they are reading place your hand over one eye, then over the other, and see if there is any difference in vision. Notice whether either eye turns to right or left, and if any action or function is wrong take the child to an expert optician for examination and to learn how sight can be improved through care and attention. Many a child has been punished for bashfulness and stupidity, when the fault was in the eyesight!

Cross eyes can be made straight and sight preserved with use of proper lenses if employed in time. Neglect will cause loss of sight in one eye, even if the eyes are straightened by surgery in after life.

The Dairy Cow.

The dairy cow does more than bring financial success to the dairy farmer. She makes him a better citizen that he would otherwise be. Her influence upon home conditions is a most pleasing contribution to those factors which kre responsible for the changed conditions which prevail in the farm homes of today. Thousands of these homes are now characterized by comfort and happiness, where formerly they were blighted by drudgery and unhappiness.

Better financial conditions have contributed to this change, and the dairy cow has been in no small measure responsib,e. She has contributed in still another way. The dairy cow teaches kindness. Her owner soon learns that only by treating her kindly can he secure the highest possible returns from her, and she responds quickly to kind words and proper care. Her disposition is one that the human family might well emulate. She is patient and long-suffering, acquiescing mutely in the arrangements made by her owner for carrying on the dairy business, striving at all times to repay him for every effort made for her care and comfort.

The members of the family, as they come in contact with her and her kindly disposition, are influenced for good. As they appreciate the financial benefit to come for caring for her well they take a deeper interest in her. In doing so they unconsciously cultivate those qualities which make them better citizens.

The dairy cow—the prototype of man's best friend—is wielding a greaterinfluence than she is generally credited with. She has always been found in the front ranks in the march of civilization and no agricultural country can long prosper without her. She is a potent factor in the upbuilding of such a country, financially and socially, and a wise people will appreciate her and encourage the industry of which she is the foundation.

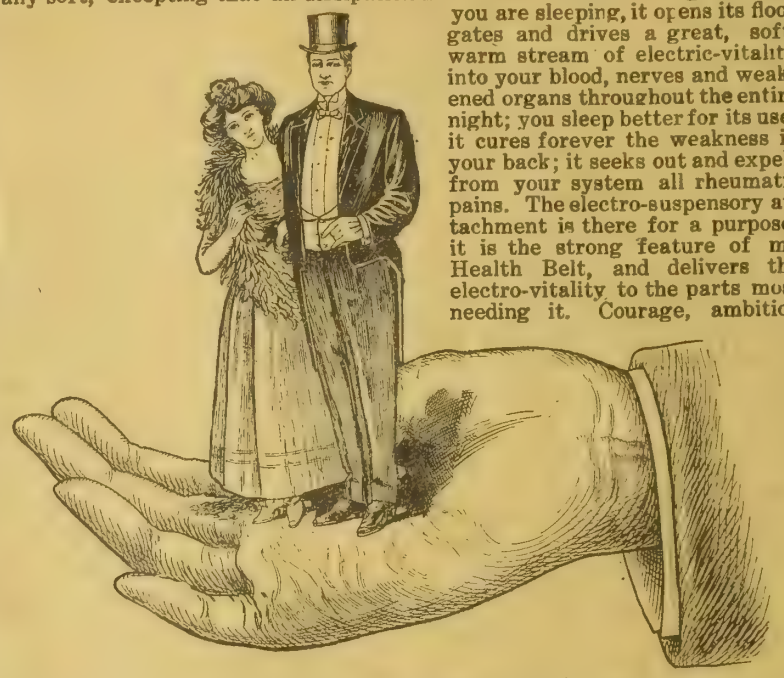
"I Present to You a "Health Belt Man."

He is 55 Years "Young."

Yes, 55 years young; not 55 old for my Health Belt poured vitality into his blood, nerves and tissues until

HIS VIGOR WAS RESTORED

My marvelous HEALTH BELT is a Wizard Worker, a mechanical self-treatment of the highest therapeutic value. It stands by you and never abandons its task until you are brought back to a state of vigorous Manhood, without an ache, pain or weakness. No drugs, no dieting, no restrictions of any sort, excepting that all dissipation must cease. Worn during the time you are sleeping, it opens its flood gates and drives a great, soft, warm stream of electric-vitality into your blood, nerves and weakened organs throughout the entire night; you sleep better for its use; it cures forever the weakness in your back; it seeks out and expels from your system all rheumatic pains. The electro-suspensory attachment is there for a purpose; it is the strong feature of my Health Belt, and delivers the electro-vitality to the parts most needing it. Courage, ambition



and a new view of life, with full, self-confidence, surely result. It makes you young and keeps you young, with the fire and vigor of the biggest, fullest blooded man you ever saw. The "HEALTH BELT MAN" cannot grow old, for he knows the secret of perpetual youth. It will place you in the "feeling fine class." "I am a man again, thanks to your wonder-working Health Belt. Use my name as you see fit." So writes C. L. Snell, of Middleport, N. Y. So have said thousands before him.

YOU CAN PAY WHEN CURED.

If you're sceptical I'll prove it first. I'll take all risk by letting you have the Belt on Free Trial, not to be paid for until cured. Send it back if it doesn't do the work.

Tainted Eggs.

It is a theory long since proved by facts, that dirty or foul water will taint the eggs as quickly as anything, and hence, apart from the necessity that pure water is to a fowl's health, it is also a necessity if one would ensure fresh tasting and good quality eggs. Fresh water must be given daily; in winter before the fowls come out in the morning, so that they will not have old or soiled water for their morning drink; and in summer when the birds are up before their human attendants, fresh water should be given the last thing at night. From now till the end of autumn all water vessels should be placed in the shade; sun-warmed water is very injurious to the birds, and anything that affects their health affects the quality, if not the quantity of their eggs. One of the greatest aids to the desirable richness of egg and yolk is to feed the laying hen on an abundance of fresh green grass, clover, or lucerne, chopped and given to the fowls in their soft food. Plenty of green food is essential to the production of rich eggs, and though fowls on a farm may have no difficulty in getting this, as they usually have the run of some field or other, chopped clover should be given them several times a week in their meal food, as there is no feeding more abundant in rich egg formation, and it also contains a large supply of highly nourishing properties.

As necessary as pure water and proper food is an abundant supply of grit and shell-making material. Fowls having no teeth, the food passes at once to the crop, or first stomach, without undergoing any change. From the crop it passes to the gizzard, where digestion proper begins. The gizzard is lined with strong membranes, by which, with the aid of grit, the food is masticated. The gizzard also secretes a powerful liquid that is capable of dissolving stones and other hard substances. Without grit in the gizzard the work of digestion is thrown on the liver and stomach, thus resulting in indigestion and liver disease. As a tonic I recommend charcoal, in the shape of burnt wood cinders. The dealer and consumer have great antipathy to thin-shelled eggs, and the egg of quality has not this fault. To avoid it the hens must be supplied with oyster shell or lime. Old mortar or plaster can always be obtained, and should be placed where the birds can pick it when they please. Under proper feeding conditions, a hen's system usually contains enough lime for the shells of five or six eggs. If lime is withheld, the hen will cease laying, or if lime in limited amounts is given, the shells will be thin in proportion. Old crockery broken up into small pieces, say the size of a grain, is the best grit that one can give one's fowls and it has the added virtue of being cheap and easily procurable.

How to Diagnose Orchard Troubles

(Continued from page 629.)

know how to spray for each individual trouble. It is necessary that you should know just what kind of machinery to use and just at what season the spraying should be done, just what mixtures to use. If any of these things are not known and observed accurately to the letter, then spraying is apt to be a failure. Pruning is another thing that helps in getting rid of disease. It should go hand in hand with spraying, because all of the diseased parts should be cut away, as spraying only prevents the spread of disease—it does not cure it.

Last, it is well to bear in mind a few general principles, that, though they are not directly connected with the diagnosis of disease, if they are carefully observed they will prevent your having any disease to diagnose. Prevention is better than cure. If this saying was ever of any value. It is certainly of value in this case. Plant diseases can far more easily be kept out than driven out. A poorly cultivated orchard is subject to disease. Poor cultivation nearly always causes the roots of plants to come near the surface of the ground, and then they suffer from dry weather, and then diseases set in. Poorly drained soil is a large factor in producing orchard troubles. Root rot of the apple tree can nearly always be traced to drainage, or rather to the lack of drainage. Many diseases arise from the planting of fruit trees upon soils that are not adapted to them. Peach trees on a too heavy soil are particularly subject to disease.

Finally, it is well to look over your orchard for symptoms, whether you know it to be diseased or not. Look over it every year, and make a habit of observing any little irregularity in the way the trees grow, and then practice a proper rotation of crops, both in the cover crops that are used in the orchard, and in the main crop itself. In removing an old orchard, or a berry plantation or small fruit plantation, put the land into something else for a few years before putting it back again into orchard or berries. This is because where a crop remains on the same land for any considerable length of time, the diseases will get in, and are hard to get out again. By rotating crops, we can starve them out, so to speak, and begin anew.

Abstract of paper read by Prof. J. Lee Hewitt, before the Arkansas State Horticultural Society, at Little Rock, Ark.

Green Plant Lice.

The green plant lice will soon begin their depredations on the apple, plum, rose and other plants. These insects can be controlled by a kerosene emulsion spray of an 8 or 10 percent strength. Another excellent control consists in the use of one pound of whale oil soap, to four gallons of water, used as a spray. Nicotine solution also kills plant lice and can be made by steeping tobacco stems or leaves in water for about one hour, being careful not to allow the water to boil. The solution should then be diluted before applying to the plants. Soap suds added to the nicotine solution greatly increases its effectiveness. The lice should be looked after early in the garden, also. Keep them off the peas and lettuce.

FLORICULTURE

A Subscriber to the Maritime Farmer wishes to know "how to make Geraniums bloom," also has Tube Rose bulbs that grow well but do not bloom.

Turn your Geraniums out of the pot or box and examine the ball of roots. If that is in good condition, the possible cause of failure to bloom results either from too large a pot and too much root room and over watering, or else keeping the plant in a shady situation. Any of those conditions being more favorable for producing foliage than bloom. For moderately pot bound water only when needed, which is whenever the top soil shows slightly dry, then water well. Give them all the sun you can and if slightly pot-bound occasionally a dose of weak manure water. Treated in this manner, Geraniums should give abundance of bloom.

The reason that your Tube Roses do not bloom, is that the centre of the flower stock is rotted. This is not an ucommon occurrence. If the crop of Tube Rose bulbs were not properly cured when lifted and dried out, a large percentage of the bulbs will lose the flower germ. Such bulbs will throw up foliage and make off shoots or young bulbs, but will never bloom. The young bulbs, if planted in a good rich soil for two seasons will become blooming bulbs, but such cheap bulbs do not pay. Throw your old bulbs away and get new ones.

Inquirer writes from Rothesay:—Please tell me the names of the plants from which leaves enclosed were taken; also if they are good house plants. And what is the best plant for cemetery grave, that will flower all summer and when should it be planted. Will Nasturtiums planted as late as this be of any value this summer; also do they require sunny or shady places?

The leaf that looks like a Spotted Maple is Abutilon Savitzii. The grass leaf is Dracena Indivisa, and the Geranium is Madame Salleroi. All are good house plants. The best flowering plant, an annual, for covering a grave is probably the Dwarf Alyssium or Tom Thumb or Little Gem. They make a carpet of

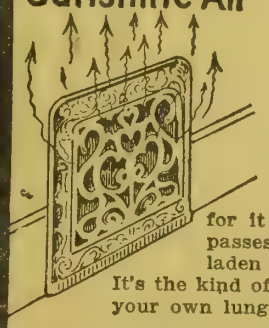
It's easy to grow plants in a Sunshine-heated home

Pure, Warm Sunshine Air



PEOPLE living in homes heated with ordinary furnaces often claim they cannot grow plants with any degree of success. This is due to the fact that ordinary furnaces are not provided with an Automatic Gas Damper. There is nothing to prevent coal-gas, which is deadly to plant life, being forced up through the registers.

Now, when the gas in the combustion chamber of the Sunshine reaches a certain pressure it *sways open* the *Automatic Gas Damper* and *passes up the chimney*, consequently there is no chance for it to escape through the registers. Instead, the air that passes through the registers is pure, warm, Sunshine air, laden with the proper degree of moisture from the water-pan. It's the kind of air that makes plants thrive and is good to breath into your own lungs.

If you want to guard your home (and who doesn't?) against evil-smelling, deadly coal gas order our agent to install the Sunshine furnace (*guaranteed*) in your cellar. 43

MONTREAL
VANCOUVER
ST. JOHN, N.B.

sweet smelling white flowers all the summer. Should be planted as soon as possible.

Nasturtiums planted now will be all right, only a little late.

They require a sunny situation to give the best results as regards bloom.

G. A. L., St. John, writes:— My Hardy Roses had hardly leaved out, before the enclosed insect appeared. Last season they turned the leaves all white eating out all the green part. What can I do for them?

The insect is the Rose Slug and it is most extraordinary to have them so early. Sprinkle them at once with hellebore; a large spoonful to a gallon of water. This should be applied once a fortnight, from now on.

Many persons who have had no experience in the care of plants, would like to cultivate a few plants for the house, but do not know what class of plants to select for that purpose or how to care for them. To such we offer a few hints. For a sunny south window, a free blooming Tea Rose, a Carnation, a Heliotrope, two or three good Geraniums and a Cala Lily will be enough for an ordinary sized window. For a north or east window, one or two Rex Begonias, one or two Ferns, one or two Blooming Begonias and for a hanging-basket or pot Asparagus, Sprengerri or a Boston Fern. All these will do fairly well in the ordinary temperature of a dwelling and if you will leave the selection of the varieties to your florist he will make a better selection of plants for ypur purpose than you could. The plants this season should be healthy and clean. The Rose, Carnation should be washed or sprayed every sunny day and if the green fly appears on Rose or Carnation fumigate the plants with tobacco smoke or wash with tobacco tea. Look over your plants at least twice a day and water whenever they need it, keeping them always on the moist side. When in active growth and especially if root bound, give air daily. If you have room add two Chinese Primroses to your east window as they are persistent winter bloomers.

Do not allow water to stand on top of pots and never rely on placing water in saucers. After watering turn out all surplus water in saucers as it will rot the roots of many plants.

Examine the drainage holes in your pots occasionally and always keep the drainage perfect.

Do not repot your plants until the soil is crowded with roots. When plants are root bound if fed twice a week with weak manure water they can be carried along some time in this rondition and many blooming and foliage plants do their best under this condition as long as the water will penetrate in portions of the ball of roots.

Turn your plants around every few days so they will not grow one-sided. If you will give them the care I have indicated you will have no trouble in having good healthy plants.

Stocks and Mignonette seem especially affected by the cool nights. The first blooms on such plants should be snipped off and branching encouraged.

Do not apply any fertilizer until the last of July until growth has become well established.

If Sweet Peas look well they should receive some support in the way of trellis. sticks or wire netting in way of trellis as soon as six inches high. A little heaping up of soil around them is a great help.

Look out for cut worms.

A Prize Contest open to the farmers of Canada

$3,600 in Cash Prizes for Farmers

READ the conditions of the Prize Contest we are conducting for the farmers of Canada. $400.00 in prizes will be awarded to each Province. These prizes will be divided into four groups, consisting of:

PRIZE "A"—$100.00 to be given to the farmer in each Province who will use during 1911 the greatest number of barrels of "CANADA" Cement. PRIZE "B"—$100.00 to be given to the farmer in each Province who uses "CANADA" Cement for the greatest number of purposes. PRIZE "C"—$100.00 to be given to the farmer in each Province who furnishes us with the photograph showing the best of any kind of work done on his farm during 1911 with "CANADA" Cement. PRIZE "D"—$100.00 to be given to the farmer in each Province who submits the best and most complete description of how any particular piece of work (shown by photograph sent in) was done.

Every farmer in Canada is eligible. Therefore, do not be deterred from entering by any feeling that you would have little chance against your neighbor. For remember, Prizes "C" and "D" have no bearing whatever upon the quantity of cement used.

As a matter of fact, your success in this contest will depend to a great extent on your careful reading of our 160-page book, "What the Farmer Can Do With Concrete." In this book—sent free on request to any farmer, full instructions are given as to the uses of concrete, and plans for every kind of farm buildings and farm utility. You'll see the need of this book, whether you are going to try for a prize or not. If you have not got your copy yet, write for it to-night. Simply cut off the attached coupon—or a postcard will do—sign your name and address thereto and mail it to-night.

Horses that Haul the Circus.

The public gives little thought to the horses that haul the great circus wagons through the streets. Attention is riveted upon the imposing wagons themselves and the curious animals and luggage with which they are loaded. Yet everyone who views the parade is conscious of a feeling of awe as the magnificent teams and heavy wagons pass by. The draft horses form fully half of the imposing picture presented a curious public. Recollections of the event carry in bold relief the image of numerous and beautiful horses. The horses contribute a potent force toward creating the general impression that the circus is "immense, suburb, wonderful, gigantic, ponderous, magnificent, tremendous, extraordinarily splendid, stupendous." Those who are privileged to witness the impressive display of concerted power, when owing to soft ground it may be necessary to put on 20, 30 or 40 big horses to a single wagon, carry away a vivid recollection to intensify their belief in the oft repeated announcement that the circus is "momentous, incredible, sensational, exciting, marvelous, spectacular, thrilling." For a large collection of high-class draft horses of one stamp and color, impressively hitched and suburbly handled nothing excels the big modern circus.

The two great historic circuses now owned by Ringling Bros. are handled when on the railway cars by gray draft horses. The drafters make up a large numerical proportion of the 1,600 horses used altogether in connection with these three shows. It is absolutely necessary to have the wagons furnished with abundant power to take them through any kind of roads and streets and up steep hills. The circus m ust go at the hour set, no matter what the weather or footing; it brooks no delay, for dates are set far ahead. The wagons are heavy and even the generous number of horses customarily allowed for each is not always enough. The largest wagons weigh as much as 10 to 12 tons with their loads. One time it was necessary to put 40 horses on one of them to take it through a muddy road, and even then it was necessary to stop every couple of rods to shovel out the mud in front of the axles which were buried in the mire. Imagine any other type of horse than drafters pulling together steadily enough for such a job. Each horse has a name and each throws his weight into the collar at the word, and hangs there until the load moves. It is significant of the efficiency of draft horses that they handle satisfactorily this important transportation problem.

Their advertising value is also one of the great assets of the circus equipment. Horses are selected for their striking appearance and attractive beauty of form and color, and they are adorned with handsome and brass-mounted harness. The shrewd business calculations of the show managers have settled upon dappled gray as the most impressive color. The stable managers believe that it has been found that as a rule the grays are the best feeders, quiet on the cars and in the stable, quick to learn and easily managed in harness in large teams. They are also declared to be more serviceable than horses of other colors, especially in keeping sound and enduring the summer heat and vicissitudes of travel without sickness. Only geldings are used as they are quieter than mares.

These grays last a long time under this strenuous life. There are six-horse teams that have all worked together for seven or eight years. Many of the horses have never missed a feed in that time and are habitually as round and fat as dumplings. Comparatively low set wide thick-muscled smooth, full-made horses are chosen for this business. Only those horses are accepted that stand upon the greatest and cleanest of bone. Big sound feet are an absolute necessity. The quality chosen is outstanding, and not only must the hair on the legs be as fine as silk but the shorter it is the better.

Every year of late the contract for fresh horses has called for more weight and quality. This year an experiment is being tried with 12 roans as a novelty for the band wagon. These roans and 34 grays were recently delivered to Ringling Bros. by Abe Klee & Son. The consignment made the best and most uniform lot of big horses seen in Chicago in many months. They were all bought in Illinois, mostly in the central and northern part.

In former years a few horses have been picked from other localities, but when they were put beside the Illinois horses it has been found that they did not measure up to the same high standard. The horses were collected early in the winter and fed in small lots at several points in northern Illinois to put on the requisite finish. For this fattening process they were put into box-stalls so as to allow enough exercise to avoid getting filled hocks, stocked legs and soft muscles. The weights averaged about 1800 pounds; some weighed as much as 1,925 pounds after shipping to Chicago and none weighed less than 1,600. The contract price is supposed to have been somewhere around $400. Every horse was guaranteed absolutely sound and satisfactory. The average size of the roans and the grays was about the same, but the grays were more uniform in quality. When the horses arrived in Chicago an offer of $425 was promptly refused for one of the roans.

The method of feeding these horses is simple. Results show that it is healthful. Horses are seldom sick. They are habitually given all the timothy hay they want to eat, but with the improvised stables and frequent railway travel the opportunity for quiet eating are not the best. When spring opens and the season's itinerary is begun the horses are put upon a ration of whole oats mixed with bran. This is dampened slightly just before pouring it into the feed-boxes. It is dealt out three times a day, giving about all the horses will eat. Bran mashes are fed as occassion requires. No corn is fed in summer, as it is thought the horses stand the heat, work and heavy feeding better on oats. The summer line is one of hard work, and heavy feeding is necessary to keep up the flesh.

When the circus is loaded upon the railway, the draft horses are put by themselves into long cars. They stand crosswise, crowded closely together without partitions, 24 to 28 in a car. Some of the cars are 50 ft. long. Each horse has a D ring in the front of his halter noseband, and into this is snapped a chain about a foot long which is fastened to the side of the car.

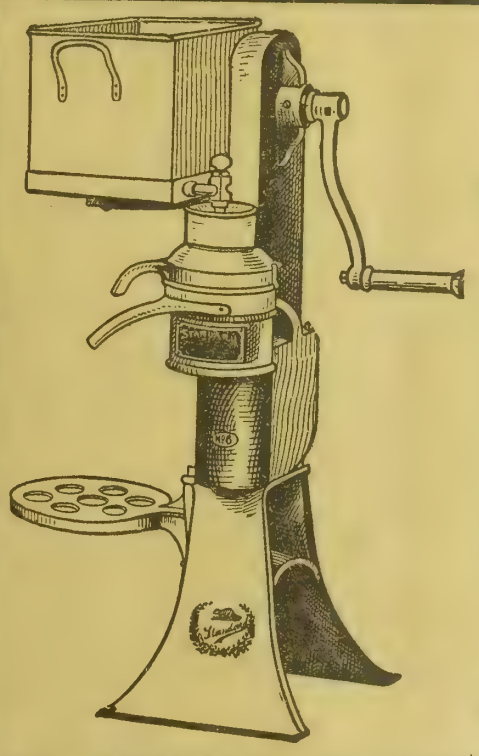
When the horses go into winter quarters at the end of the show season the shoes are all pulled off. Each pair of horses stands in a double stall with a 2x4 in. plank hung between them to prevent kicking. They are fed corn, preferably on the cob, twice a day, and all the timothy hay they will eat. Each horse is fed separately even in winter and the amount of corn given is regulated by the condition, the object being to put on flesh gradually during cold weather so as to have a reserve to go on during the next summer and to have all the horses as presentable as possible by spring. The horses are turned out during the middle of the winter days for exercise in a lot regulated according to the number of the horses. One barn holds 236 horses, another 200; other have less capacity. Each barnful is turned out into a lot just large enough to allow them to move around easily but not to run and fight. The result is that during the whole time they are out a constant milling motion of the herd is maintained. The active horses force the others to move about and all get exercise sufficient to keep them in good condition but not violent enough to afford risk.

A notable feature about the work of circus draft horses is that its intermittent features are even more violent than the alternations of hard and easy work on the farm, and it necessitates to even a greater extent the frequent hitching of teams together in unusual and large combinations. The fact that big draft horses, combining powerful build with enduring quality, have proved by long experience best adapted to the exacting circus life, indicates that this type of horse should also best for farm work. In the development of the Ringling Bros.' business from a little traveling company to a combination of three great circuses the draft horse has been indispensable. He is needed for work, and he does it more economically than any other type of horse. So true is this that there has been a steady increase in the size of horses used. Through mud, rain and heat these horses take their loads. They drink all kinds of water, they work far into the night, they keep irregular hours and spend their rest time largely jostling about in the cars; but their tempers are unruffled, they are always ready for a long hard pull, and always ready for their feed. There is really not a great deal of effort expended upon these horses but they perform an immense amount of heavy tiresome work.—E. T. R., in Breeders' Gazette

Sheep Shearing Machines.

A. S. M., P. E. I.:—Are shearing machines preferable to hand shears? Would a machine pay for itself with one hundred sheep?

Ans.—When machine shearing is once introduced into a district it rapidly takes the place of hand shearing for the reason that it does the work more quickly and better. It leaves a smooth finish and when carefully exercised the skin is seldom cut. In some localities each owner of a flock of fifty or more sheep usually has a machine of his own. In some cases a travelling shearer does the work for the smaller owners at a price of about ten cents per head. With a boy to turn the machine an experienced shearer will clip five or six sheep in an hour. Machines are made in various sizes costing from about $10 to $15 for a hand machine and up to $100 for a power machine. For a flock of 100 sheep a hand machine would do the work quite satisfactorily.



"THE STANDARD"

IS THE WORLD'S GREATEST SEPARATOR

The **"Standard"** is the nearest approach to Cream Separator perfection ever accomplished, not only in skimming but in every way. It is constructed on approved mechanical principles and materials of the highest standard only are used. Its cost is very little higher than ordinary machines and its productivenes is 25% to 40% greater than the old method of skimming and 10% to 25% over all other separators.

SHARPLES

Tubular Cream Separators
Repeatedly
Pay For Themselves By
Saving What Others Lose

Sharples Dairy Tubulars produce twice the skimming force of others. Skim faster and twice as clean. Last a lifetime. No disks or other contraptions. Built on the only known principle by which the many parts and many disadvantages of others can be avoided. That principle is patented—is used exclusively in Sharples separators and explains why Tubulars are The World's Best and have no imitators.

Guaranteed forever by oldest separator concern on this continent. Manufacture of Tubulars is one of Canada's leading industries. Sales exceed most, if not all, others combined. Probably replace more common separators than any one maker of such machines sells.

You can own and use a Tubular for less than any other. How can you afford the expense of any "peddler's" or other (so called) cheap machine that lasts one year on the average? Our local representative will show you a Tubular. Ask us his name. Write for catalog No. 194

Dainage Waters and the Absorbtion for Soluble Manurial Compounds.

By what agencies are the soluble phosphatic and organic nitrogenous compounds and the soluble salts of ammonia and potash absorbed by and retained in the soil? There is some difference of opinion as to which substances are most potent in this respect, but it is agreed that the causes of absorption are both physical and chemical. It has long been known that ordinary loamy soils act as a very efficient filter for sewage materials, while even pure sand will remove common salt from solution if the filtering column be made long enough; and in these and similar cases the changes are probably chiefly, if not wholly, physical, akin to what happens when charcoal is made to act as a deodoriser, or destroyer of noxious smells. Thus, at the Manchester Sewage Works in 1900, when the sewage was allowed to percolate through 5 feet of soil, the organic nitrogen was reduced from 0.36 to 0.056 parts per million, and the free ammonia from 1.89 to 0.92. It must always be borne in mind, however, that such nitrogenous organic compounds, occuring in farmyard manure, sewage, seaweed, etc., readily undergo change to nitrates wherever the conditions are suitable, and loss is then liable to take place.

In the absorption of ammonia salts such as sulphate of ammonia, at least three classes of chemical reactions are involved, while it is no doubt also partly due to some physical process. It is generally recognized that the continued use of sulphate of ammonia results in a gradual exhaustion of lime from the soil, and this is due in the first instance, to a chemical reaction which may be represented as follows:—Sulphate of ammonia, plus carbonate of lime, equal sulphate of lime, plus carbonate of ammonia. The sulphate of lime readily passes into the drains, while the ammonium carbonate is held up in the soil. Why the very soluble ammonium salt should be retained, and the out, is not clearly shown. At Woburn, for example, on a light, sandy soil, the repeated application of sulphate of ammonia resulted in almost comulete exhaustion of lime from the soil, and a dressing of lime became absolutely necessary in order to restore the fertility. The ammonium carbonate may possibly undergo some further change whereby it is rendered insoluble, or it may be retained by some physical process, or it may be nitrified, and the latter process will involve a further demand upon the soil lime.

A similar reaction to the above may occur with humus, or organic matter, present in the soil, the ammonia going into combination with the complex humic acids and lime or other base coming into solution as the sulphate.

The third chemical change depends upon the presence of small quantities of leolites, which are hydrated double silicates of alumina, with one or more secondary bases, such as potash, soda, lime, or magnesia, held in a loose state of combination, and readily replaced by other bases. With sulphate of ammonia, then, the ammonia displaces one of these bases, and forms an insoluble compound, while a sulphate again goes into solution. It is further contended that hydrated iron oxide, which is usually present in greater or less proportion in all soils, has the power of absorbing ammonia by forming an insoluble compound with it.

Very similar reactions to those above described take place in the absorption of potash salts. Carbonate of potash is said to be absorbed, probably by some physical process, without undergoing any change; but in the case of the sulphate or chloride which are the forms usually met with in potash manures, a reaction first occurs with the lime or humus carbonate of potash being formed, and sulphate or chloride of lime appearing in the drainage waters. Leolites and the oxides of iron and alumina are also said to play a prominent part in potash absorption. In some cases the application of potash salts is found to be followed by the appearance in the drainage waters of corresponding amounts of soda, but in most soils it is lime which is turned out of combination and washed into the drains. In the case of soluble phosphates the causes of absorption are more easily understood, as there are in the soil several substances, e. g., carbonate of lime, iron oxides and silicates of alumina, which readily form compounds with the soluble monocalcic phosphate, which are insoluble in water, and therefore not easily washed out. But this difference should be noted—with lime, a phosphate is formed which, though insoluble in water, is easily soluble in water containing carbonic acid or weak organic acids, and hence is available for plant growth; whereas iron and aluminium phosphates are only very slightly soluble in weak acids, and so are not readily available to plants. Hence, where soluble phosphates are being used, it is well to see that sufficient lime is present to ensure their retention in an available form.

One further point in connection with the retention of potash and phosphoric acid deserves notice. It is clear that the efficiency of these absorptive processes will depend very largely upon whether the salts are retained in the surface layers of the soil or in the subsoil, and Dyer has made careful investigation into this aspect of the question. In the case of potash, he found that only about one-half of the surplus potash added is retained in the top 9 inches of soil, and a part of it reaches a depth of 27 much less soluble sulphate washed inches before it is absorbed. This means, of course, that part of the potash does get beyond the range of the plant roots, but it must be remembered that it is always liable to be brought to the surface in the capillary water, and hence it cannot by any means be looked upon as lost—as it would be if washed into the drains. With phosphoric acid, again, Dyer found that about 80 per cent. is retained in the top 9 inches of soil, and about 40 per cent of this is held in easily available forms. The practical significance of these facts is that many highly manured lands may contain accumulations of potash, and perhaps phosphates, in the subsoil, and such soils might be much improved by stirring up the subsoil in order to induce a better circulation of water, which would facilitate the rise of these substances into the surface layers, where they would be available to crops.

The chief practical corollaries of the above facts may now be summarized as follows:—(1) Lime and nitrogen are the most important and valuable constituents of drainage waters. The loss of lime is unavoidable, as several of its chief functions in the soil depends upon the formation of soluble salts which are readily washed out; but by a judicious use of manures containing nitrogen, and by adopting a proper system of cropping, the loss of nitrogen, as nitrates, may be very largely controlled. In this connection we must bear in mind that organic nitrogenous compounds and ammonia salts, although themselves quickly absorbed by the soil, are always liable to undergo the process of nitrification, after which the nitrogen may be lost as nitrates. (2) Soluble phosphates and potash salts are quickly and almost completely absorbed by ordinary soils, and may be applied almost at any season of the year without any danger of serious loss occurring. The best time to apply any manure containing either or both of these substances will depend chiefly upon the nature of the manure and the crop on which it is used. Thus kainit should be applied in winter for potatoes and in spring for oats, while sulphate of potash should always be applied in spring. Again, superphosphate will usually give the best results on all crops when applied in spring. (3) It is not enough that manurial salts should be retained in the soil, but they must be held (a) in an available form, and (b) within the range of plant roots of average depth. Thus, soluble phosphates may be retained by combination with iron orides, but such a compound is only slowly available; while a fair proportion of soluble potash salts may be washed into the subsoil out of reach of plant roots before they are ultimately fixed in it.—Scottish Farmer.

Eradicating Couch.

Editor Maritime Farmer:—

In reply to your inquiry regarding couch grass, might say that we have had quite a lot of experience with it, but we don't mind it much or find it very hard to eradicate.

For a number of years, after my father died, as I was but a boy, we did not do much cropping, and sold the hay off the farm. Consequently couch got a bad hold in some fields. We find, however, that since we have been getting our farm into a regular rotation of crops that we have gotten quite clear of it.

Our practice is, starting with a hoe crop of potatoes, turnips, mangolds, etc., to follow with oats or mixed grain seeded down to clover for third year. The fourth year we get a crop of good clean timothy, then turn out to pasture for one or sometimes two years before working up into roots again. Our practice used to be to take a crop of grain of the green sward before the hoe crop, but we have dropped that as we find it especially conductive to the growth of couch grass and other weeds.

As regards eradicating a field where it has a stronghold, grazing for two years will be a great help to smother it. Following with a crop of potatoes will almost annihilate it. Potatoes seem to do very well in couchy land too, as I suppose, the sod and decaying roots tends to keep it open and supply humus. The couch must be kept down however, by cultivation. We put our potatoes in with a double mouldboard plow, in good sized rows, so we can harrow them down, plow them up and harrow them down agin before they come up. Then if they are kept cultivated and have one good thorough hand hoeing around the plants the couch will have no chance and one will have an ideal field for mangels, parsnips or small

Mid-Summer Agricultural Meetings.

The following list of meetings has been arranged by the New Brunswick Provincial Department of Agriculture, at the invitation of the various Agriculture Societies, at the various points mentioned.

It is proposed that at each place a field meeting shall be held in the afternoon where the subject of Soil Cultivation will be practically taken up and discussed, as well as lessons given in Live Stock Judging.

The ladies of the district will also meet during the afternoon when the lady delegates will give a demonstration and lead a discussion upon matters connected with Domestic Science It is understood that the Cooking of Meats will be one of the subjects taken up.

The following include some of the speakers who will attend the various meetings:

Messrs. Andrew Elliott, Galt, Ont.; Theodore Ross, Charlottetown, P. E I.; Seth Jones, Sussex, N B.; A. G. Turney, Provincial Horticulturist; Secretary for Agriculture and others.

The speakers and demonstrators on Domestic Science will be Miss Bessie Elliott, of Galt, Ont., and Mrs. A. E Dunbrack, of Fredericton, N. B.

In the evening a joint meeting will be held at which addresses will be given.

JUNE.

Monday, 12th—Andover.
Tuesday, 13th—Florenceville (Consol. School.)
Wednesday, 14th—Debec.
Thursday, 15th—Waweig.
Friday, 16th—Leverville.
Saturday, 17th—St. Stephen.
Monday, 19th—Harvey.
Tuesday, 20th—Prince William.
Wednesday, 21st—Hoyt Station (afternoon) Fredericton Junction (evening.)
Thursday, 22nd—Stanley.
Friday, 23rd—Chatham.
Saturday, 24th—Coverdale.
Monday 26th—Hillsboro.
Tuesday, 27th—Port Elgin.
Wednesday 28th—Upper Sackville (B. M. Fawcett's Farm)
Thursday, 29th—Petitcodiac.
Friday, 30th—Kingston (Consol. School.)

JULY.

Saturday, 1st—Jeffrey's Corner.
Monday, 3rd—St. John.
Tuesday, 4th—Welsford or Summer Hill.
Wednesday, 5th—Jerusalem.
Thursday, 6th—Hiberuia.
Friday, 7th—Cambridge.
Monday 10th—Upham.
Tuesday 11th—St. Martins.
Wednesday, 12th—Midland.
Thursday, 13th—Chipman.
Friday, 14th and Saturday, 15th—Sussex.
Tuesday, 18th—Bathurst.

The following meetings will be addressed in the French language and the speakers will be Messrs. Emile Plante, St. Jerome, P Q.; L. C. Daigle, Moncton, N B.; the Commissioner of Agriculture and others.

JUNE.

Monday, 12th—Balmora,.
Tuesday, 13th—Durham.
Wednesday, 14th—Petit Rocher.
Thursday, 15th—Grand Anse.
Friday, 16th—Caraquet.
Saturday, 17th—Pokenouche.
Monday, 19th—Shippegan.
Tuesday, 20th—St. Isidore.
Wednesday, 21st—Tracadie.
Thursday, 22nd—Riviere des Caches.
Friday, 23rd—Rogersville.
Saturday, 24th—Acadieville.
Monday, 26th—St. Louis.
Tuesday, 27th—St. Charles.
Wednesday, 28th—Richibucto Village.
Thursday, 29th—Ste Anne.
Friday, 30th—Ste. Marie.

JULY.

Saturday, 1st—St. Paul.
Monday, 3rd—Cocagne.
Tuesday, 4th—Grand Digue.
Wednesday, 5th—Barschois.
Thursday, 6th—Upper Aboujagane.
Friday, 7th—Memramcook West.
Monday, 10th—Drummond.
Tuesday, 11th—St. Leonards.
Wednesday, 12th—St. Basile.
Thursday, 13th—St. Jacques.
Friday, 14th—St. Hilaire.
Saturday, 15th—St. Francis.

vegetables the next year.

We have put a couchy field right into turnips using a chain harrow. This is not a very rommon implement, but is made up of a lot of links about four inches square. They are joined togetherand spread over about ten feet square. Dragging this over the ground knocks all the mud off the roots and rolls them up into bunches that can be gathered with a fork and carted off the field. Of course, we prepare the land some the fall before by plowing shallow, as soon as we get the cows off it onto the grass, and then cross plowing late in the fall generally with a sidehill plow, as it turns the furrows all one way leaving no dead furrows. This leaves the sods and couch turned up to the action of the frost and rains of the winter and spring, so that it tears to pieces quite easily when we commence to harrow.

I think much the better and cheaper way, though, to get rid of the couch, is to kill it by cultivation and the potato crop, as the decaying couch roots makes quite a bit of humus which if carted off, will be lost. I dare say summer fallowing with cultivation would kill it, but land is most too valuable here in these provinces to do without a crop for a year.

If a short rotation is followed and the hoe crop properly attended to, there will be no trouble with couch. Some farmers may say that they can't raise enough grain by just having the one grain crop in the rotation, but it is the only way to get a farm clean of weeds and we find it better to sell some vegetables and hay and by some grain and mill feeds than to try to raise enough grain, which is practically the same as raising all our own feed on one's own farm which we hear preached about so much.—Hugh A. Dickson, Central Onslow, N. S.

Good Poultry Records.

Editor Maritime Farmer:

I read with interest the letters from "V. P." and others re the egg record of their hens and as you have asked others to send in their records I give you mine as follows:

Month.	1908.	1909.	1910.	1911
January.....	65	150	62	94
February.....	144	137	142	110
March.....	441	342	370	354
April.....	425	351	414	....
May.....	414	288	408	....
June.....	374	367	390	....
July.....	321	205	348	....
August.....	288	128	388	....
September....	271	180	338	....
October.....	133	142	123	....
November.....	.....	60	59	....
December.....	.....	62	56	....
Totals	2876	2412	3098	....
No. hens kept	24	24	25	22
Aver. per hen	111.5	100 5	124.8	..

These hens are Barred Plymouth Rocks, and are pure bred as I can get them. I feed them in winter with grain in the mornings, warm bran mash at noon, and grain at night. They also get plenty of warm water or milk, oyster shells, gravel and Golden Tankard Mangels cut in slices. They are exceeding fond of these sliced mangels and will eat this kind before touching any other kind. In summer they get about the same kind of feed but less of it, as having the run of the farm they pick up quite a lot. The grain mentioned includes oats, peas, wheat and cracked corn. I think the cracked corn the best feed of all. The eggs are gathered three times a day.

Trusting the above records and notes may interest some of your readers and hoping to see others send in their records I will close, but first I must say that I appreciate the Maritime Farmer very much.

We think that each issue is an improvement on the previous one. — Farmer Boy, Pictou Co., N. S.

A Comparative Test of Canadian Alfa fa in England.

The Journal of the Royal Agricultural Society of England for 1910, contains the final report of an interesting experiment conducted at the Woburn Experiment Station in the testing of varieties of lucerne grown from seed of French (Provence), American and Canadian origins.

The test was begun in 1905, and in 1910, the fifth and final year, the report says, "the plots were all dug up in preparation for a more extended experiment with Lucerne, the Provence and American varieties having, to all purposes, come to an end, though the Canadian variety would have continued to yield a crop for some years more."

In every year, the yield of the Cabadian variety was markedly higher than that of either of the others, the excess over its nearest competitor, the American, being 5 tons, 10 cwt. in 1909 and 7 tons 6 cwt. in 1910.

Three varieties from the Argentine were also tested in 1908 and 1909 but failed completely, being attacked by a fungus from which the earlier sown plots were free.

The luxuriant growth of the Canadian sort kept down the weeds effectively, while the lighter yield on the other plots resulted in their being over-run with them.

The name of the Canadian seed originally used in this experiment is not known, but the test is being renewed this year with Canadian seed of known origin, in comparison with varieties obtained from Turkestan, Provence and other countries.

Teat Plugs.

Subscriber, Fredericton, N. B.:—Where can I procure a teat plug such as is frequently recommended as a remedy for hard milkers in the columns of your paper.

Ans.—Teat plugs are frequently found for sale in drug stores. If your druggist does not keep them, send 27 cents to us and we will forward you one. State whether obstruction seems to be near the point of teat or near udder. Your other questions have been forwarded to our veterinary for reply, and will appear in our next issue.

Outline of Mid-Summer Agricultural Meetings.

Following is a copy of a letter sent to Agriculturial Societies by W. W. Hubbard, Secretary for Agriculture.

"Between 12 June and 15th July next it is proposed by the Department of Agriculture to provide speakers for between twenty-five and thirty meetings to be held throughout the English speaking districts of the Province, if the various Agricultural Societies, or people where there are not societies, desire to co-operate by arranging for the meetings and securing an attendance.

"In addition to purely agricultural matters at the request of a number of farmers' wives who have expressed their views, it is proposed to discuss, the woman's part in the making of the farm home, and two ladies experienced in this work will be sent.

"The proposed programs for these meetings would be expected to include:

"In the Afternoon: Demonstrations of Cultivation and Live Stock Judging for men. Andrew Elliott, Galt, Ontario, will be one of the speakers. Also during the afternoon the ladies of the district will meet at a hall or residence, where the women delegates will discuss with them the work of Women's Institutes as carried on in Ontario and elsewhere, and give practical demonstrations on the selection and cooking of meats to bring out a discussion upon the best methods of preparation and cooking that the greatest food value may be secured and the dish presented in the most attractive form.

In the Evening: A joint meeting will be held, when short addresses will be given by both men and women delegates and the fullest discussion invited from the audience.

"It is suggested that those who come to the afternoon meeting might arrange for picnic supper so that all could remain for the evening session.

"Would your Society like to arrange for one of these meetings? The Department will be glad to receive suggestions as to any special subject you might wish discussed. These meetings will be arranged as far as possible to meet the requests of the societies and they will be considered in the order in which replies to this letter are received, due regard being given to the distribution of the meetings so that no county will be overlooked.

See list of dates elsewhere in this issue.

MEN! I'LL CURE YOU BEFORE YOU PAY ME

Let any man who is weak, broken down, old and decrepit in physical weakness, full of pains and aches, gloomy, despondent and cheerless—any man who wants to be stronger and younger than he feels—let him come and tell me how he feels, and if I say that I can cure him and he will show that he is honest and sincere, he need not pay me a cent until I cure him.

I don't want money that I don't earn. I don't need it, and I am not after it. But I am after the dollars that are now going wrong in the quest of health. Look at these poor wrecks of humanity that are spending all they can earn on drugs—dope that is paralyzing their vital organs—that have spent all they have earned for years without gaining a pound of strength for the hundreds of dollars wasted.

That is the money that I am after, because for every dollar I take I can give a thousand per cent. interest. And I don't want it at all until I have cured you, if you will secure me. I have cured so many cases right here that I can prove my claims to you, but if that proof is not enough, I'll cure you first and then you can pay me. Is that fair?

Most of the Belts that I am selling now are to men who have been sent here by their friends whom I have cured. I think that is the best evidence that my business is a success from the standpoint of cures, as well as on the dollar side.

Just lately I have received letters of praise from these men :—

J. DAHAL, SS. "Mima," Halifax, N. S., completely cured of Rheumatism.

W. Y. PYKE, Red Bay, Nfld., cured of general debility.

WM. J. BYERS, Nipissing, Ont., restored his strength, after being unable to work for years.

JOHN NOBLE, Hanover, Ont., cured of Rheumatism.

If you will come and see me, I'll explain it to you. If you can't call, let me send you my book, full of the things a man finds inspiring to strength and courage. Free if you send this ad.

M. K. McLaughlin, 214 St. James St., Montreal, Can.

Dear Sir : Please forward me one of your Books, as advertised.

The Hay Situation.

Notwithstanding the large export demand from the United States for Canadian hay our farmers have a considerable amount yet to market between now and the new crop, although the best qualities are pretty well all picked up, and American buyers have now to be satisfied with second best grades, and they are very glad to get them. An American buyer was prowling around on the north shore last week, when he called upon a farmer in that district and asked him what hay he had left. The farmer replied:—"Why some time since you looked at the same hay I have in the barn, and you said it was not good enough for you." "Oh well" said the American, "I may be able to use it, as my customers are taking that class now." The result was that the farmer received $1.00 per ton more than he was offered by a Montreal firm. American buyers are said to be paying $11.00 to $12.00 per ton for Canadian hay at country points for what they call good. No. 2; but which a short time ago they would not look at, and only classed as No. 3. The prospects are that this province and Eastern Ontario will have a fair crop of hay, but not as heavy as that of last year. Last week prime Canadian hay fetched $10.00 in New York and No. 1, $27.00 to $28.00, but since then it is said $27.00 was about all buyers would pay for No. 1.

Danish Treatment of the Cows.

The million dairy cows of Denmark are confined almost exclusively to two breeds the Danish red or Zealand and the islands, and the Jyske, or black and white cow of Jutland. Both of these have been developed within the last thirty-five years from the native stock of the country by careful selection for milk production.

The development of the breeds to such a high degree in twenty-five to thirty years has been due to the farmer's skill, intelligence and common sense in selecting and breeding for milk production alone, and the efficiency of these cows is a most striking example of what may be accomplished in a short time if good, systematic work is done and common sense and judgment are exercised.

While many of the bulls used are young and untried, they are always individuals of merit, and from cows with large records. Only the best heifers are raised, and with the record of the dam and the qualities of the sire known, their selection is comparatively simple, and better cows can be raised than can b bought on the open market. The price of the cows is from £16 to £18, some of the best averaging as high as £20, so that it is also profitable from the financial standpoint to raise the young stock to replenish the herd Heifers drop their first calf at from two to two and a half years of age, and if they prove to be good producers, are usually kept in the dairy until twelve years old, when they are are fattened for beef.

The cows are treated with kindness and every effort is made to have them comfortable at all times. On many farms the cows are generally groomed. Tethering the cows on the grass is usually commenced the fore part of May, for a portion of the day at least.

Many of the dairymen on the small farms milk three times a day, having ten cows to the milker. On the large farms they usually milk but twice a day, having from fifteen to twenty cows to the milker, requiring two an a half hours night and morning to do the milking.

The cows are allowed to go dry from six to eight weeks. To supply the Danish export trade of butter, an even flow of milk is required the year round and most of the cows freshen from September to May. The male calves and any heifers not needed for future cows are sold for veal at from three to four weeks old. Calves are not allowed to suckle their dams. They are fed whole milk for the first week. After this it is gradually changed to skimmilk, and this is fed to the heifers until they are four to six months old. From this time on they are raised on pasture during the summer and in the winter are given hay, straw and roots and sometimes a little oil cake.—Ex.

A Catechism on Tuberculosis.

Dean H. L. Russell of the Wisconsin College of Agriculture, who is one of the foremost bacteriologists of this country, and Professor E. G. Hastings of the same college, have issued a circular, No. 23, "On the Nature and Testing of Tuberculosis." Oves sixty questions pertinent to the most practical survey of this disease are considered and answered in the best scientific light obtainable. Among them are the following:

What is tuberculosis?

A transmissible disease caused by a specific kind of bacteria. The organisms leave the body of the diseased animal in various ways and enter the body of a second healthy animal.

What animals have tuberculosis?

All warm blooded and some cold blooded animals. In the northern portion of this country it is the most important disease of cattle. Of the domestic animals, cattle, hogs and fowls are most often affected; sheep, horses, dogs and cats, but rarely. Most of the wild animals in captivity die of tuberculosis.

Is one breed of animals more susceptible to tuberculosis than another?

Cattle of any breed, beef or dairy, acquire tuberculosis quickly and easily, when once brought in contact with diseased animals giving off tubercle bacilli. The reason why more dairy than beef cattle have been found to be affected is because of the much greater exchange, the longer period for which they are retained and the closer confinement to which they are subjected.

How is the disease introduced into a herd?

1. By the purchase of diseased animals.

2. By feeding mixed factory by-products, such as raw, creamery skimmilk and whey.

3. By direct contact with an affected animal.

What per cent. of domestic animals have tuberculosis ?

It varies widely in different countries and in different parts of the same country. From July, 1908, to July, 1910, over 90,000 animals, largely milch cows were examined for tuberculosis in Wisconsin and about five per cent. were found to be diseased.

What is the tuberculin test ?

If a tuberculosus cow has a small quantity of tuberculin introduced beneath the skin, a temporary fever will result, which can be detected by taking the temperature of the animal a healthy animal shown no such fever.

Does the use of tuberculin injure animals?

Tuberculin has no ill effect whatever on healthy animals, and no harmful effect on tuberculous animals. It does not, in the amount used in testing, have any effect on the progress of the disease in the animal, nor can it in any way produce the disease. With many of our best herds it has been used regularly for 10 or 15 years with absolutely no injurious effects. The statements that the tests causes abortion or other ailments are without foundation. The flow of milk is not changed to any appreciable extent, even in the case of tubercular animals.

How can a diseased herd be freed from tuberculosis ?

Test the whole herd. Remove all reacting animals. Retest all suspicious animals in three months, and the entire herd again in one yeat, and annually thereafter. Disinfect the stable.

How can a herd be kept free from tuberculosis?

Test annually or at least every two years, and retest all suspicious cases in three months. Test every animal introduced into the herd at the time of purchase, and again in three months. Use a farm separator or feed only skimmilk and whey that have been heated.

Bloat in Cattle.

Now that alfalfa and other green feed is coming on, bloat or tympany, of the rumen, will begin to deplete the herds. In spite of the accurate knowledge possessed by most cattle owners in regard to this subject, there are still those who will turn hungry cattle from dry feed into a field of young alfalfa, and then wonder why they die so quickly.

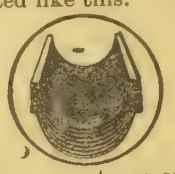
A good rule, followed by most men, when a green pasture is to be used for the first time, is to let the cattle fill up on dry hay, first, and then, after the dew is off, turn the animals into the pasture for a short time, better not more than a half hour the first day.

During the first few days it is good policy to watch them closely. A trocar near at hand at this time will be found to be worth more than a hundred stored away in some veterinarian's case. If any animal bloats seriously, do not hesitate to tap, as usually time is only wasted in giving medicine. The other animals must be removed immediately.

No farmer should be without a trocar in this case, because even though

PEDLAR NESTABLE CORRUGATED GALVANIZED CULVERT

THESE culverts of mine are a great thing for the farming world. They not only make good roads possible, but they serve the farmer in many other ways. And they are so simply laid. They come nested like this:



This compactness saves freight and makes it easy to handle them. You put the sections together like this:

Then you clamp the flanges together like this:

And you've got a piping that will outlast anything of the kind there is. Better get the book and sample and study it.

G. K. Pedlar

Saves Farmers' Money
Betters Roads—Lowers Taxes

JUST give me the chance to prove to you that my Culvert is so far ahead of any other in everything that makes a culvert good, that you won't be satisfied until your township authorities have read my book —sent free—and are also convinced of its superiority. You will benefit through better roads, lower taxes and prevention of washouts. My Culvert actually costs less than even the cheapest and most unreliable wooden culverts. Outlasts and excels wood in durability and reliability, and all other materials in economy, strength and genuine utility. Write for my Free Book and read the facts—then do what you can to have Pedlar Culvert used in your township

Pedlar Culvert is put together and in place in one-third the time required for any other culvert. No special skill needed; no bolts, no rivets. Easiest to install, and by far the most economical and most durable.

Pedlar Nestable Culvert also has

A Score of Uses On YOUR FARM

Makes the best possible well curbing or cistern lining, and keeps your water supply pure. Makes it easier to water your stock. Use Pedlar Culvert to drain any swampy spots or for irrigation ditches and under-drains. Or to instal a permanent sanitary sewage system. Or to pipe water from springs or windmill tanks. Get my book and read how it "fills the bill" and saves your money.

WE WANT AGENTS IN SOME LOCALITIES. Write for details. Mention this paper.

to be of any use as the animal will time will ordinarily not permit him to be of any use, as the animal wi,l likely die before the veterinarian can reach the place.

A great variety of drugs has been used to stop the bloating, with more or less success, but usually in these acute cases from green feed, the trocar is the only remedy that can be depended upon.

The location for tapping is not nearly so difficult to find as some suppose. Most anywhere between the hip bone and the last rib, on the left side, will do, as it is well to keep in mind that the organ you are trying to,tap, ordinarily holds from 40 to 60 gallons. About half way between these two points is preferable. —I. E. Newson, Colorado Agricultural College, Fort Collins.

A French Remedy for Contagions Abortion.

One of the most serious troubles dairymen and stockowners have to contend with is contagious abortion among their breeding animals. A treatment for the prevention of contagious abortion in cattle, which is said to have been attended with very highly satisfactory results, has been practiced in France for a number of years, and has at last attracted the attention of veterinary surgeons throughout that country. This treatment was first made public in the journal of the Veterinary School of Lyons, as far back as 1897, by Mr. Ch. Geuin, agricultural engineer, and president of the Agricultural Society of Gourgoin.

Mr. Geuin gives the following description of his methods of conquering the disease: "It consists of subcutaneous injectuons of 2 per cent of carbolic acid (20 grammes of acid in 1000 grammes of boiling water) every 15 days, to all the in-calf cows from the fifth to the seventh month of gestation. The injection is made in the animal's neck, just below the dewlap; the quantity injected is 20 cubic centimeters. The process is simple, with out danger, as it is without pain to the animal; it has this advantage that it may be employed by any handy person, and it costs very little. The result of this treatment has been that in my herd abortion has completely disappeared since it was first applied in June, 1895."

During the previous four years the disease was so serious that 75 per cent of the breeding cows in his herd aborted. His cow byres were built on the most approved plan. They were kept scrupulously clean, the walls were frequently whitewashed with lime and sulphate of copper, and the cows were washed almost daily with antiseptics. Notwithstanding these precautions the disease still remained. There are many corners. in a byre in which the germs of the disease may remain, no matter how carefully the premises are disinfected and there are many agents for the dissemination of those germs, of which flies are certainly the most active. Mr. Geuin concludes with the following remarks:—"From the time I used the first injection to the present day, there has not been a single instance of contagious abortion in my herd. On my recommendation, many cattle breeders ihave adopted the process, and in all cases with the same success."— New Zealand Dairyman.

Scours and Other Calf Questions.

In raising pure bred calves from cows, who give a high test of butterfat, has it come within your observation, that if these calves are allowed to suck from birth, scours occur in nearly every case. Will you please give me a detailed advice on the following points:

1. Should a calf be allowed to suck a cow at all? If so, how long?

2. Should a calf be given treatment to counteract the scours in the ?vent of their being allowed to suck?

3. If the calf is not allowed to suck, should it receive the mother's milk, or should it receive milk not containing colostrum?

5. Ifithe calf be allowed to suck for several weeks, is there any effect on the milk production of the cow after the,calf is taken away? ...

6. Is there any difference in the growth, stamia and health of a calf raised by hand, than the one that is allowed to,suck a cow for several weeks, not only in the near future, but in the development of the calf to maturity.

Ans. There has been more or less complaint of scours in all breeds but probably more of this malady in breeds and herds noted for high per cent of fat in the milk. And this is no more than could reasonably be expected when due consideration has not been given to the circumstance that such milk contains a much larger amount of total solids. For example, in 10 lbs. of milk carrying 3.5 per cent fat there are approximately 1.2 lbs. of total solids. Whereas in 10 lbs. of 5.5 per cent milk there are about 1.5 lbs. total solids, or 25 per cent more. Hence 7½ lbs. of the richer milk contains more nutriment than 10 lbs. of the 3½ per cent. and if fed in equal amounts will almost invariably produce indigestion, the common forerunner of scours.

This may well account for the greater proportion of the cases of scaurs, but we confess that it is quite common among dairymen and veterinarians to attribute the cause simply to the inability of the calf to take care of the larger fat globules in the richer milk. But since the overfeeding of skimmilk will produce the same kind of scours, we are inclined not to accept in full the theory that it is only the fat itself in the rich milk which causes scours.

Passing to the specific questions we are inclined to answer as follows:—

1. Our personal practice is to let the calf suck from three to five days but other dairymen practice taking the calf away as soon as dropped and feeding it the fresh colostrum milk from its dam.

2. If unfortunately scours develop the first thing to do is to cut down sharply on the amount of milk. A mild dose of castor oil may be given to help expel the fermenting undigested food in the digestive tract. There are many other remedies proposed, but in a general way it may be said that the treatment may follow almost without variation such as would be given a young child in the same condition.

3. See answer to the first question. The colostrum should not be ommitted.

5. The cows will give much less milk during the remainder of the lactation period, and with some cows during subsequent periods.

6. If properly fed there will be no appreciable difference, except for the first few weaks. The nursing calf usually overtake the calf that has more glossy appearance, but later when the milk diet is withdrawn, the hand-raised calf does better and will usually overtake ehe calf that has run with its dam. And for the dairy purposes the hand-fed calf on skimmilk is to be preferred.—E. K. B. in Hoard's Dairyman.

The Removal and Disposal of Cows that have Aborted.

Recently "G. B.," in the course of a general question relating to the association between epizootic abortion and breeding failures among members of the herd, referred to a cow that had aborted, which he had shut in a building quite away from other cows, and intended to "feed for killing." This isolation, if really effective, which would include the provision of a separate attendant, who must not come near any of the milking cows—an important item commonly overlooked on the farm—would be a most useful proceeding, the proposal to feed out for the butcher is not in accordance with the most recent recommendation or practice. Isolation and fattening-out used to be considered the correct thing to do; but now, as pointed out in reply to "G. B.," the aborted cow is considered a valuable asset to be retained and bred from again in place of selling out and buying in fresh cows, whether in calves or newly-calved cows from clean herds. It is to be feared— and we attribute it largely to the comparatively little interest excited among farmers by the appearance of the reports of the Departmental Committee appointed by the Baord of Agriculture and Fisheries to inquire into epizootic abortion in cattle—that this aspect of the case is not properly appreciated. It used to be quite a prevalent custom to feed for the butcher cows which had aborted; in fact, it is the custom now where farmers are sufficiently alive to the seriousness of the disease which unfortunately many are not, to determine to get rid of it at any cost. It is also customary to sell such cows alive in open market. Referring to these practices in Part I. of their report, the committee deprecate the selling of aborted cows alive in open market as likely to introduce the disease to other establishments. and unless the animals have ceased to discharge it is considered that they should be kept for at least three months after abortion before being sent for sale. The practice of feeding for the butcher is, of course, much less objectionable from the point of biew of preventing its extension to other farms and cowsheds, but it is now considered that a cowkeeper is much more likely to get rid of abortion from his herd by keeping such animals than disposing of them, and bringing in new ones before his entire herd is free from disease. The report says:—"There can be no doubt that in most cases an attack of the disease greatly increases an animal's resistance to future attacks, and that in a large proportion of the affected, probably in the majority, this resistance is sufficient to fortify them against infection during their next pregnancy. It is beyond doubt that a considerable proportion may abort twice in succession, but it is not improbable that inoculation methods may now be successfully employed to exalt their resistance. In the midst of infection there is no better guarantee against the disease than the possession of an immune stock, and for this reason we consider that on infected premises the animals that have already aborted are to be looked upon as valuable assets for purposes of eradication, much more valuable than the new and susceptible animals brought in."—M. R. C. V. S. in Mark Lane Express.

How to Figure the Amount of Butter Fat.

Farmer's Wife, Vic. Co., N.B.:—Can you give me data on how to figure the butter production from cream, say a cow gives 500 lbs. of milk, in seven days, testing 5 p. c. That, of course, would make 25 lbs. of fat. Now, how much butter of 80 p. c. fat would that make and how do they get it?

Ans.—If no allowance is made for the unavoidable losses in creaming and churning 500 lbs. of 5 p. c. milk will make 31.25 lbs. of butter 80 per cent fat.

When butter contains 80 per cent. fat, the overun, that is, water, salt, curd, etc., is 25 per cent. If 25 is divided by 4, we get 6.25. Add this to the 25 and we have 31.25 which is the amount of butter that can be made containing 80 per cent fat from 25 lbs. of fat. Taken in another way, 25, the amount of fat in 500 lbs. of milk is four-fifths of the number of pounds of butter that can be imade containing 80 per cent fat. If 25 is four-fifths, then one-fifth is one-fourth of 25 or 6¼. Five-fifths is 5 times 6¼ or 31.25.

Depraved Appetite.

J. K. M., Richmond Co., N. S.:—I have a cow that eats dirt. Please let me know what will stop this.

Ans.—She craves something not given in her rations and should be given a variety of food. Also in feed twice daily a tablespoonful of a mixture of two parts powdered wood charcoal and one part each of hydrastis and granular hyposulphite of soda. Better keep her where she cannot eat earth.

Getting at the Sense of the Situation.

The Judicial Committee of the Privy Council has upset the judgment of an Ontario Court which awarded damages to a man who was injured while riding without authority on a railway train. The Privy Council held that while a railway by its sale of a ticket contracted to safely carry the holder it had no contract with a man who had no ticket, and was in fact a trespasser, who might have been prosecuted for his act.

The case in point happened on a train which was backing from one Station at London, Ontario, to another in a different part of the City and on which a trespasser jumped on the rear platform to steal a ride between the two stations, There was a collision and the man was seriously injured, resulting in a suit against one of the railways The Trial Judge and Jury acquitted the railway. The Higher Court reversed this judgment and the railway appealed. The Court of Appeals in Ontario sustained the Higher Court, after which it was taken to the Privy Council, and the Lords of the Judicial Committee reversed all the judgment but the Trial Judge. The defendent had to pay the costs in all the appeals.

Occasionally it pays a railway to fight a damage claim. It may get the case before a Court which gets at the sense of the situation.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Breakwater at Dalhousie, N. B.," will be received at this office until 4 00 P. M., on Wednesday, July 5, 1911, for the construction of a Breakwater at Dalhousie, Restigouche County, N. B.

Plans, specifications and form of contract can be seen and forms of tenders obtained at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N. B.; Geoffrey Stead,. Esq., District Engineer Chatham, N. B., and on application to the Postmaster, at Dalhousie. N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, made payable to the order of the Honourable the Minister of Public Works, for two thousand six hundred dollars ($2,600.00), which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned

The Department does not bind itself to accept the lowest or any tender,

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Work,
Ottawa, June 6, 1911.

Newspapers will not be paid for this advertisement if they insert it without authority from the Department.

1 Cent a Word.

This department is one of the most valuable in the MARITIME FARMER. At a cost of only one cent a word, you can advertise anything you wish to buy, sell or exchange. The address must be counted as part of the advertisement and each initial or a number counts as one word. Cash must accompany each order and advertisement must have address on, as we cannot forward replies sent to this office. Copy must be received not later than Friday before the date of issue, which will always be found on the editorial page of the proceeding issue. No black faced type or display of any kind will be allowed under this head, thus making a small ad. as noticeable as a large one. The rate for this column is one cent a word, each insertion. MARITIME FARMER, Sussex, N. B.

EGGS FOR HATCHING.—Orpingtons from my prize birds Whites, $2.00 per 13; Black's $2.00 per 13; Buffs, $1.50 per 13—E. H. PARSONS, Box 458, Springhill, Nova Scotia.

REMEMBER! Reeves Munroe, Consulting Electrical Engineer, Taymouth, N. B.

WANTED—Freehold, Timber and Pulpwood tracts. Send full particulars, and state best cash price. Address "TIMBER," Box 131, St. John, N. B.

FOR SALE.—Eight pure bred registered sows from my best sows, also 15 registered Yorkshire sows and boars, from registered stock Apply at once to PETER BRODIE, York, P. E Island.

DESIGNS, plans and bills of material prepared for Houses, Barns and Rinks of either timber, balloon or plank frame construction. Prices low Write for particulars.—ALFRED A. GILMORE, Draftsman, Huntingdon, Que.

BAIN WAGON FOR SALE.—We are offering one heavy Bain Lumber or Farm Wagon for sale cheap, on easy terms. For particulars write M. A. MACLEOD, SUSSEX, N.B. or W. C. MACLEOD & SONS, LOCH LOMOND WEST, N. S

ALL kinds of books on Poultry, Pigeons, Rabbits, Pheasants, Horses, Cattle, Farming, Gardening, Bees, Fruits Flowers, Vegetables, etc, Catalogue free.—MORGAN'S POULTRY SUPPLY HOUSE, London, Ont.

THREAD POWER FOR SALE.—One second hand two-horse Moody thread power for sale cheap. First set of planks still on the machine. Write POWER care of MARITIME FARMER, Sussex, N. B.

EGGS FOR HATCHING.—Barred Rocks; 1st pen is headed by one of the finest narrow Barred cockerels in the province, mated with six large well Barred hens, yellow beaks and legs; 2nd pen pullets headed by a very fine cock. Eggs $2.00 per 15. Satisfaction guaranteed.—EDWARD JORDAN, Kentville, N. S.

MARKETS.

With respect to feeds, a remarkably good demand is reported. On account of raising more cattle and going in more for dairying operations as a result of the recent encouragement of high prices, there is more feeding being done. Stocks are consequently taken up about as quickly as they arrive. Middlings are scarce, but bran is more plentiful. There has been an advance at milling points in cornmeal and feed flour.

Flour, $4.45 to $6.10.

Beans—Prime, $1.95 to $2.10.

Peas—$4.75 to $6.00.

Oatmeal, Standard, in bbls., $5.40 to $5.50; Oatmeal, Standard in bags, $5.20 to $5.30; Rolled Oats, in bbls., $4.90 to $5.00; Rolled Oats, in bags, $4.70 to $4.80; Middlings, $26.50 to $27.00; Bran, $24.50 to $25.00; Shorts, $25.00 to $25.50; Feed Flour, bag 98 lbs., $1.70 to $1.75; Cornmeal in barrels, $3.10 to $3.20; Cornmeal in bags $1.45 to $1.50; Feed Oats, in bags, 50c to 52c; Hay, $10.00 to $12.00.

PROVISIONS.

The Chicago National Provisioner, of last Saturday, says that the average price of hogs in Chicago for the previous week was $5.91 per hundred, which was nearly ½c. a pound under the preceding week and slightly more than 3½c. per lb. under last year at the same date. With the exception of the corresponding week in 1908, the quotations for the week mentioned were the lowest since 1905. The average was about 50c. per hundred under the average for the same week during the past 9 years.

The packing of hogs at Western United States centres for the week mentioned was 560,000 against 455,000 last year, and the total pack for March, Appril and May was 6,825,000, as compared with 4.825,000 last year.

A strengthening feature of the situation, however, is the grain crop outlook in the United States. While conditions were favorable for seeding, and the planting of corn was advanced under very favorable soil conditions, the dry weather which has prevailed has caused some little apprehension, and as a result, there has been an advance in the price of all kinds of feed stuffs, such as corn and oats.

The low prices of hog products have been favorable to a large export trade and there has been a large movement of lard from American parts to the old country.

The beef market is slightly easier, but in the opinion of live stock men in the west, we are on the eve of an advance in cattle prices. However, time will tell, and business locally at this time of the year is so light that there is not the same concern with regard to market changes as there would be during the spring and fall months.

BUTTER, CHEESE & EGGS.

In sympathy with foreign markets the price of butter in Canada is easier and the fact that the output this season is likely to be large does not make the prospect for an improvement in values any too good. Australia and New Zealand are still shipping large quantities to the English market and prices in Liverpool are lower than they have been at this date for some years. The United States market too has an oversupply of stock, so that there is no outlook for the Canadian production save the consumption of our own country, which is not large enough to absorb the output of the different factories as it is produced from week to week. Next week will probably see the first offerings of field grass butter, and what speculators will be willing to pay for this article and put it in storage we are not in a position to predict. So far as the Maritime Provinces are concerned the production will be more than is necessary for local needs and jobbers say they are being offered as much or more stock than they need for immediate requirements.

All the Maritime Provinces cheese factories are now in operation. There is, however, no surplus as yet, as the market has been able to absorb supplies about as fast as they have come forward. The market is steady at a fractional advance on the prices quoted by us two weeks ago.

Eggs are in good supply, the weather of late being very favarable for a large production. If anything the market is a little easier, jobbers paying about 17c. for fresh stock.

Creamery prints, 26c. per lb.; creamery, solids, 25c per lb.; dairy solids, 18c to 22c per lb.; dairy rolls, 20c to 22c per lb.; cheese, twins, 13½c per lb.: cheese, large, 13c per lb.; new laid eggs, 19c.

VEGETABLES.

Lettuce, per doz. heads, 60c; cabbage, new American, per crate, $4.00; beets, per bbl., $2.00; carrots, per bbl., $2.25; potatoes, P. E. I., per bag, $2.50; potatoes, N. S., per bag, $2.25; apples, per bbl., $3.00 to $5.00; parsnips, per bbl., $2.00; American squash, bbl., $3.75; parsley, per doz., 60c.; native rhubarb, per lb., 1½c; asparagus, American, per doz. bunch 55c.; tomatoes, American, per crate, of six, $4.50; cucumbers, each, 10c; strawberries, 17c; cherries, per box, $3.25.

CHEESE.

There has been a steady movement of cheese at enhanced values since our last report, sales aggregating 10,000 boxes, being reported to us of Western at 11 1-8c to 11 3-8c as to quality and Eastern at 10 3-4c to 11 1-8c. One shipper, however, stated that he found it difficult to get over 11c for finest Eastern. The Western dairy boards have raised their prices during the week, the ruling rates on most of them being 10 15-16c to 11c. The quality of goods arriving is said to be excellent and very little cutting has been necessary. Prices are a trifle higher in this market than they were a year ago. English buyers are loth to increase their limits, although they are being dragged up gradually.

Hurry, Hurry,

and ask us for prices on Chatham Incubators and Brooders. Our prices are lower than any other standard make in Canada.

After June 1st we will sell settings from the following birds, at half price, $1.00 per setting: S. C. Brown and White Leghorns, R. C. White Leghorns, Black Leghorns, White Dots, Buff Dots, Houdans, White Faced Black Spanish, Blue Andalusians, Dark Brahmas, Buff Orpingtons, S. C. Black Minorcas, White Minorcas and Anconas.

We Send this Book Free On Request—Use the Coupon

YOU only need to look at the contents page of this book to see how complete and comprehensive it is. In all the hundred pages between its hard, cloth-bound covers, there is not one single superfluous word--nothing but a carefully indexed mass of necessary information. There is no other book in existence that deals so thoroughly with every vital, essential fact--that so clearly tells the farmer

"How to Build Rural Telephone Lines"

When you get this book, read it over at least twice. You will need to do that to assimilate the information it contains. No matter in what phase of the work you are interested—whether you want to know about telephone company organization, whether you want to know about the actual construction of the line, whether you want to know what other community-owned telephone companies have done, or whatever it is you do want to know, you will find the facts set forth in detail in this book. This volume has cost a lot of money and careful study to prepare and we really ought to charge for it. As long as the edition lasts, however, we will send it **free,** but only to those who, by asking for it, signify that they are really interested. Are **you** interested? If so, clip the coupon, fill in your name and address and mail it to us today.

CONTENTS

CHAPTER		PAGE
I.	Story of the Telephone—Invention—Early Experiments—Present Situation—Value to farmer—Comments of the Press	7-23
II.	Company Organization—Mutual and Stock Companies—Constitution and By-laws — Construction — Survey of Toll Lines	24-35
III.	Constructing the Line—Different Systems—Poles and fittings—Setting the Poles — Guying—Line Wire and Stringing—Splicing—Insulation	36-56
IV.	Installing the Instruments—Connecting to the Line—Protectors—Drop Wires Inside Wiring—Ground Wires—Batteries—How to use the Telephone—Signals	57-65
V.	Materials Required—For Main Line —For Each Telephone Station	66-68
VI.	The 1317 Type Telephone Set—New Features—Woodwork and Assembly—Transmitter—Receiver—Ringers and Gongs—Generator—Switch Hook—General—Specifications	69-78
VII.	Rules for Wires Crossing Railways—General Order of Canadian Board of Railway Commissioners—Dated Oct. 7th, 1909—Signed by Hon. J. P. Mabee, Chief Commissioner	79-93

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Breakwater at Dalhousie, N. B.," will be received at this office until 4.00 P. M., on Wednesday, July 5, 1911 for the construction of a Breakwater at Dalhousie, Restigouche County, N. B.

Plans, specifications and form of contract can be seen and forms of tenders obtained at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N. B.; Geoffrey Stead,. Esq., District Engineer, Chatham, N. B., and on application to the Postmaster, at Dalhousie, N. B.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms; the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, made payable to the order of the Honourable the Minister of Public Works, for two thousand six hundred dollars ($2,600,00), which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned

The Department does not bind itself to accept the lowest or any tender.

By order,
R. C. DESROCHERS,
Secretary.

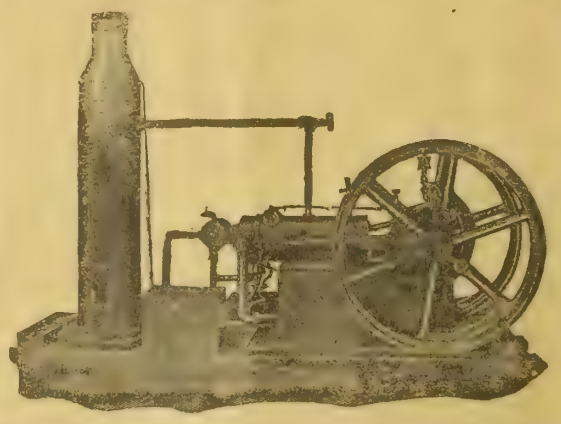
Farmers of Quality



Stationary and Mounted, in 1-2 to 30 Horse Power

Want Quality!

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of sealing directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinde head, so that when the valves become worn, the valve cage andivalve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P. engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

Farming in the Wake of the Lumberman.

FOR many years New Brunswick forests have rung an echoing response to the woodman's axe and the clang of circular saws in the busy mills, where the logs that are usually floated down the rivers are manufactured into various classes of lumber. The forests of the province cover a large area and scores of lumbering companies operate very extensively, in various sections, from the Fundy tide-washed shores on the south to Chaleur Bay and the Province of Quebec on the north.

The lumbered areas, in many cases, contain some extensive tracts of soil, eminently suited for grazing and cultivation. The keen observer can readily picture a possibility of carrying on the farming industry on a progressive scale on these areas when our own young men and immigrants from foreign lands realize the noble heritage that New Brunswick's fertile soils can give.

We venture to make the assertion that many of the strangers who seek a home in Canada and who are too frequently rushed past us to the West could find more congenial homes for themselves and their families in New Brunswick, where there are hundreds of opportunities for progressive young men, who wish to follow an agricultural calling and where farm lands may be purchased at terms to suit any well intentioned, industrious man.

One of the extensive lumber operators in southern New Brunswick is the S. H. White Co., Limited, whose president, Mr. S. H. White, of Sussex, is considered to be one of the most progressive business men in the province, and who is intimately connected with not a few other industries, that help to make New Brunswick industrially, what it is.

About thirteen years ago, the S. H. White Co., Ltd., purchased a mill and a large acerage of timber lands, on the banks of the Pollett River, in the counties of Albert and Kings, and continued operations much more extensively than their predecessors. The log drives come down the river, for distances of upwards of twenty-five or thirty miles, to the mill pond which furnishes the power for the wheels that drive the clanging saws in the mill at Forest Glen. As the logs are ripped into their respective classes of lumber, the finished product is hauled to a nearby siding of the Havelock and Elgin Railway from whence it is shipped to home and foreign markets.

When the property was purchased, some thirteen years ago, there were

FOREST GLEN STOCK FARM.

A FARM CUT OUT OF THE FOREST.

The Lumber Mill at Forest Glen owned by the S. H. White Co., Ltd.

The Forest Glen Farm Dairy Barn.

only about two acres of cleared land in the vicinity of the mill. Mr. C. R. Colpitts, an intelligent, industrious man was secured as foreman for the lumber and milling operations.

A careful survey of the property revealed an extensive area of undulating land in the vicinity of the mill. This land consisted of a light clay soil with a stiff clay subsoil and although virgin it was not considered by local "wiseacres" to be any too fertile. It had not, however, been tried or proved. As the marketable timber was cut down the land was greadually cleared, crops of various kinds were sown, and, ere long, abundant yields from small areas testified to the fact that the soil was such as would handsomely reward the tiller's toil.

The river bottom meadows, woodland glades and hillsides the grazing grounds for centuries of the lordly moose and timid deer, yielding an abundance of succulent grasses and clovers were well suited for grazing lands and as the cultivated acres were not extensive enough to engage in the dairy industry, the company decided to follow the beef raising industry until such a time as they would have enough land cleared and cultivated to make it worth their while to engage in the dairy business, the backbone of the farmer's avocation in Kings county.

The rough pastures, already referred to, were soon stocked with Hereford cattle. The Herefords throve and grew fat on the succulent grasses and were finished off for market after the summer grazing. As the cultivated areas were enlarged and appropriate dairy feed was grown, the Herefords were gradually supplanted by grade dairy cattle and these in turn, during the last three years are rapidly being replaced by a magnificent herd of purebred, registered Ayrshires.

A representative of the Maritime Farmer, who visited Forest Glen last week went over the pasture lands, cultivated fields and through the barns and pens with Mr. Colpitts, the energetic manager of the lumber, milling and farming operations, found everything in shipshape and learned of the changes that have been placed there during the past thirteen years.

The plow has followed in the wake of the woodman's axe until an area of nearly 150 acres is included in the well-kept cultivated fields. The greater part of the cultivated portion has been ditched and the few stray stones on the surface have been carted away so that practically no obstructions

Chesley R. Colpitts Manager for the S. H. White Co., Ltd., Forest Glen, N. B.

"Chesley" is well liked by all the employees and consequently there never is any trouble in the ranks.

are in the way of the plowman. Consequently, instead of the patchwork system of farming that is so often seen in the Maritime Provinces, large areas are gone over and devoted to the respective crops en bloc.

Sixty-two acres are devoted to the growing of hay, giving an average yield per acre of nearly two tons. This amount of hay is not sufficient for the seventy-five head of stock, and consequently about thirty acres are sown to oats and cut green, when in the milk stage, to supplement the hay. From 3,000 to 4,000 bushels of turnips and about 200 barrels of potatoes are grown each year. No grain is fed to the cows while at pasture but an area of from two to three acres are sown with oats and peas and used for soiling purposes as soon as the pastures fail to furnish sufficient food to keep up the milk flow.

In their system of rotation of the crops they plan to sow a liberal quantity of clover seed mixed with a small quantity of timothy seed at the time the oats are sown, from which as a rule, they get a good crop of clover during the first season and a crop of timothy and clover the following season. The land is then plowed again and used for a crop of green straw after a liberal dressing of branyard manure has been incorporated with the soil.

Last year about an acre of alfalfa was sown using oats as a nurse crop. About one-third of this area has survived the winter and at the time of our visit was about two feet high. Mr. Colpitts is quite an alfalfa enthusiast and feels confident, that the lessons he has learned from a close study of his alfalfa plot and avoiding some of the mistakes he has made in the past, will help him to grow alfalfa successfully at Forest Glen.

The turnip fields are manured in the fall. All the rest of the manur? is hauled out in the spring from a cellar under the dairy barn where it is mixed with liberal quantities of sawdust and other absorbents to conserve all the liquid manure.

Nearly all the work on the farm is done with one team of Clydesdale horses that yield a good revenue by working in the lumber woods during the winter. About the time farming operations begin in the spring, the lumbering operations are completed and, as a rule, the log drives are in the company's mill pond, and a few extra horses are always available for a few days work during the rush season preparatory to seeding.

The company cuts about 4,000,000 feet of lumber per year, the refuse from which is burned in a large furnace and all the ashes are hauled out and spread thinly as a top-dressing on the hay fields by the use of a manure spreader. The results are quite satisfactory. This with the growing of clover reduces the fertilizer bill to a minimum. Labor saving machinery of nearly all kinds are found on the farm and used to good advantage.

One of the most profitable branches of the Forest Glen farm is hog raising. About fifteen brood sows, pure bred Yorkshires and Berkshires are kept and upwards of 150 young pigs are sold each year for breeding purposes. Both the Yorkshires and Berkshires are of exceptionally good quality and their owners are careful not to send out any specimens for breeding purposes that would reflect any discredit on their breeding or that would be a detriment to securing future orders. The company's experience so far has been that one pig sold is an advertisement that can sell other pigs in the same locality. During the summer season the sows are pastured, which with a liberal amount of skim milk keep them in a good, thrifty condition, capable of giving strong, healthy litters and consequently very few pigs are lost at farrowing time. The hog house is roomy, well ventilated, and has an over-head trolley system that reduces the labor of cleaning out the pens. The farrowing pens can be heated, at any time, should occasion so demand.

The Dairy Barn is well equipped, and is one of the most modern barns in the county. Water is brought by the gravity system from springs. The houses are supplied by this system and the cattle have water before them at all times. Owing to the proximity of the barns to the refuse furnace, when a strong westerly wind blows the buildings are in danger of fire, indeed several years ago one of the barns was burned to the ground. One of the most valued modern conveniences used in connection with the company's buildings is the Acme Steel Ladder. Only last spring, the roof of the dairy barn caught fire, a hole was burned through and the fire gained access to one of the hay mows. The mill crew mounted the Acme Steel Ladder forming a bucket brigade and after a strenuous fight of several hours duration they managed to extinguish the blaze and save the building, which would certainly have been burned to the ground were it not for the carrying capacity of the Acme Steel Ladder. The brigade on the ladder at one time numbered twenty-five men. The company has no hesitation in recommending the Acme Steel Ladder to our farmer friends.

The dairy herd consists of 75 head, all ages, of which twenty-five head are now milking. Last year the milking herd numbered twenty and gave a total of 67,000 pounds of 3.5 per cent. milk which was separated on the farm and the cream shipped to the Maritime Dairy Company, Sussex, of which the Forest Glen Farm, is one of the largest contributing patrons. The milk from each cow is tested for butterfat once a month, but each individual milking is weighed and a careful record is kept.

When this system was first inaugurated at the farm some of the hired help thought it a sort of a new-fangled idea that was not worth attending to. Now, they are all converted to the idea so that if any one of them were to become manager or owner of a herd they would not think of getting along without keeping records.

The Mill, Barns, Manager's and Employees' residences at Forest Glen. The Manager's home is the middle residential building in the picture.

Although the records are not as high as some claim, still when the reader considers that the Forest Glen herd is still in its infancy and that a large percentage of the herd was made up of heifers the showing is not too bad. It is the company's aim to work up a herd of good average production.

A strict record is kept of the expenses of every animal on the farm, and woe betide the animal whose yearly production account does not show a profit over its maintenance account.

The weeding system is being consistently enforced, not by the unloading on unsuspecting buyers, but by sending the non-paying animals to the butcher's block by the shortest route.

There are some exceedingly good producers in the herd and the offspring of these, that can be spared are sold at prices that are within the reach of any person who is anxious to get an Ayrshire herd header or a few females. Production is what the company is looking for. They do not purpose exhibiting at the fairs, as they do not believe the qualities of an animal either in body or production is enhanced by being pampered and fitted for exhibition purposes.

For the information of our readers we can say that there are individuals in the herd that would make some of the good ones at our exhibitions, if we may be allowed to use the common expression "go some."

The milch cows are pastured in the pastures on the home farm but the younger stock and dry cows are sent away to pasture on the mountainsides, near the head waters of the Pollett River.

Separate accounts are kept of the lumbering, milling and farming operations. Each account bears a proportionate part of the manager's wages. When the team is used in connection with the lumbering end of the business their maintenance is charged against that account. In a similar way the farm has to pay for any extra help obtained from any of the mill hands during a rush season.

The manager's home is fitted up with all modern conveniences and is an ideal farm home. While the company does not claim any large profits from the farm, they do claim that were it not for the farm the lumbering and particularly the milling operations would cost them very much more than they do at present.

The S. H. White Co., Ltd., has set a pace worthy of the emulation of other large lumber operators. May the example they are setting be an incentive and an example for other firms and individuals to follow so that instead of devastation following in the wake of the woodman's axe, it may be followed by the inte,ligent use of the plow and the virgin soil made to bear bountiful harvests to handsomely reward the toil of the industrious husbandman.

Repelling Flies.

A subscriber who wants a mixture for spraying cattle to keep away the flies, will find the following formula a good one: Fish oil, 100 parts; oil of tar, 50 parts; crude carbolic acid, 1 part. This mixture may be applied with a hand sprayer every day or two. The cost is from 25 to 35 cents a gallon, varying according to the profit demanded by the dealers, and will be found to be a great comfort maker for the single cow, or entire herd.

A Fine Quintet of Ayrshires. The Pride of the Forest Glen Dairy.

Treatment of Muck Soils.

Muck soils are widely distributed, in large or small areas. When properly drained and handled they are in many cases extremely productive. The amount of muck land reclaimed by drainage and brought under cultivation is rapidly increasing, and it is becoming a matter of considerable importance to know the best methods of utilizing such lands. Extensive areas of muck soils are found in Florida, and in a recent bulletin of the Florida Station, A. W. Blair summarizes the results of his study of these soils and makes suggestions regarding their treatment which are of general interest. He states that "muck soils are formed by the decay in low wet places, of grasses, weeds, twigs, leaves and even trees. Being so largely formed from vegetable matter, they are much richer in nitrogen than ordinary soils. They usually also contain small amounts of phosphorus and potassium."

It is recognized, of course, that proper drainage is a necessary prerequisite to the use of muck soils, for "if muck soils are to be cultivated it is obvious that they must first be drained. This is necessary in order that they may become the home of the various kinds of micro-organisms that play an important part in the making of a fertile soil. These micro-organisms need moisture, but they can not develop in mud or standing water."

The method of cultivation requires particular attention.

Cultivation should be deep, especially at first, in order that the air may thoroughly penetrate the soil. Muck soils often contain substances that are injurious and even poisonous to plants. When these poisonous substances are exposed to the air they are probably oxidized to a considerable extent and thus destroyed. A free circulation of the air also improves the conditions for the development of the useful micro-organisms.

Muck soils are generally acid or sour, and this acidity must be corrected before they will be productive.

Suitable materials for this purpose are finely ground limestone, air-slaked lime, wood ashes and marl. Finely ground limestone (the native rock) is to be preferred to the forms commonly used, since it is effective, is more easily handled, and harm is not likely to result from the use of amounts in excess of what is needed to neutralize the acids

It will be necessary in most places to use larger quantities (of neutralizing material) on muck soils than on upland soils. If limestone is used 2 to 6 tons per acre should be applied. If lime is taken, a ton and a half or two tons may be used. The material should be thoroughly worked into the soil one or two months before the crop is planted. This will give time for the lime to neutralize the acid.

The importance of destroying the acids can be better appreciated when we remember that the micro-organisms that convert organic nitrogen into a form that can be used by plants can not develop in a highly acid soil. The limestone and lime also furnish a suitable base with which the nitric acid that is formed may unite, thus producing calcium nitrate which can be taken up by plants.

If muck is to be used for fertilizing purposes, on upland soils, it is also necessary for the acids to be destroyed. This can be done either by composting it with one of the materials already mentioned, or by applying the latter when the muck is applied, or afterwards, and thoroughly mixing both with the soil by cultivation.

A Bunch of Pure bred Ayrshires owned on the Forest Glen Farm.

Muck may be improved by simply drying and thoroughly airing it. This is especially true of mucks that contain iron compounds. We can not expect a satisfactory yield of such crops as celery and lettuce on muck land until the acids have been largely destroyed.

It occasionally happens that a muck deposit is underlaid with marl, or is in close proximity to a limestone formation. In such cases it is not so likely to be acid, and might not require the treatment with lime.

Muck soils being especially rich in nirtrogen should, one would think, require but little, if any, of the nitrogenous fertilizers. Experience, however, has shown that in many cases they do require added nitrogen. This is because they are so strongly impregnated with acids that the bacteria which would otherwise convert the inert nitrogen of the organic matter into soluble nitrates can not live. When this unfavorable condition has been corrected, less nitrogen in the form of commercial fertilizer will be required. If a quick-growing vegetable crop is being produced, nitrate of soda may be used to good advantage, as may also stable manure, since it introduces beneficial bacteria; but sulphate of ammonia and organic forms of nitrogen (such as cotton-seed meal and castor pomace) should not be used; the former because it will aggravate the acid condition and the latter because there is already enough organic nitrogen present. Phosphoric acid and potash may be used liberally if desired. For phosphoric acid, ground bone is an excellent material; while a ton or two of finely ground phosphate rock (floats) would also be helpful; not so much, however, for immediate results as for future crops, since the acids in the muck will very gradually convert the insoluble phosphoric acid into the available form. For potash any of the potash salts will suit. Kainit has been used on the muck soils of Illinois with good results. Hard-wood ashes are an excellent source of potash, if they can be produced on the place or bought at a reasonable price.

Curing Clover Hay.

In view of the difficulty generally encountered in securing properly cured clover hay, it is believed that the suggestions on this subject by W. P. Brooks of the Massachusetts experiment station will be of interest and value to many who are engaged in the growing of clover for hay. Prof. Brooks points out, in a government report that the first consideration is the proper degree of maturity of the clover and states that clover is often allowed to stand too late to give best results when cured as hay.

If it be suffered to remain until a considerable proportion of the heads are brown and the seed ripe, there will be but little rowen, while there is much danger that the roots of the clover will die after the crop is cut. Relatively early cutting, then—before many of the heads are brown—is desirable, both because a better rowen crop will be secured and because the clover will persist in the mowing longer. Good weather is essential for the satisfactory making of clover hay as it is, indeed, for the satisfactory making of any hay; but it is far more important in the case of the clovers than for timothy, on account of the fact that the clovers need much more drying. The best hour in the day for cutting, is late in the afternoon. Whatever the hour, it is essential to keep in mind the fact that in the curing of clover hay it should be handled but little after it begins to dry. It is generally well understood that too much handling as the crop dries results in the breaking off of the leaves and heads, which are the most valuable portion of the crop.

Whatever the hour of cutting, then, the fact should be kept in mind that this crop should be tedded little in curing. If cut late in the afternoon, the crop may be tedded once the following forenoon. If the weather is particularly fine, it will then be ready to rake and put into cocks late in the afternoon of the same day. If the clover is curing more slowly it may be best to leave it in windrows over one night and to turn these carefully with the fork the next afternoon and to cock on the afternoon of the second day after cutting.

The use of hay caps in curing clover hay should be more general. It is desirable to leave the clover in the cock for a number of days, sometimes as long as a week. The hay is coarse and if exposed to rain it is badly damaged unless the cocks are protected by caps. When examination shows that the clover in the cock is apparently cured, it should be slightly opened and turned up from the bottom on the forenoon. Clover hay cured in this manner should hold substantially all its leaves and heads, and should cure of a bright green color. Such clover is one of the most valuable forage crops, whether for cattle, sheep or horses. Well-cured clover hay, popular opinion to the contrary notwithstanding, is a safe and valuable food for horses, which will need much less grain when fed such hay than when timothy hay is used.

A Peculiar Disease.

C. E. F., Sable River,—Please answer through the columns of the Maritime Farmer the cause and cure of the following:

Heifer thirteen months old, last Saturday started swelling on the left side of jaw, and continued to swell across underside of jaw to right side, then down the throat to foreleg. One foreleg swelled to the knee the other to the foot. The swelling continued along the underside of belly to flank. It would start in blotches and spread until they would meet, somewhat like hives on a person. On Tuesday morning she died. As I think this will be of interest to the general public I shall look for an answer through the columns of the Maritime Farmer.

Ans.—The description is too vague

WEED SEEDS AND BAD POTATOES.

Mr. P. G. Butler, Secretary of the St. John's Newfoundland Agricultural Society, has sent us a copy of a letter that Mr. H. Cowen, President of the society, sent him. The letter is self explanatory and a due warning to shippers that the Newfoundland people will not be imposed on or allow their island colony to become a dumping ground for inferior seed. The sooner our farmers, who raise seed oats for sale, realize this, the better it will be for all concerned. A few unscrupulous dealers may ruin the reputation of all the honest efforts that have been put forth to remedy the bad seed evil. Our advice to all farmers, who have oats or other seeds for sale, is to sell the goods for what they are. If oats contain so many weed seeds that they cannot be honestly classed as first class seed, for goodness sake do not try to palm them off as seed oats; sell them for feed oats and you will not be lowering the reputation of your neighbors, who may have a first class article.

The letter reads in part as follows :

"My attention has been called to the weed seeds in the oats imported from Prince Edward Island for seed, and to the wretched sample of "Beauty of Hebron" potatoes from Dicksons and I am desirous to ask you to write to the senders of the oats and let them know this and that Dicksons be asked to compensate the one ton of potatoes not being worth half the money charged as they were both soft and bad."

AGRICULTURAL MEETINGS AND WOMEN'S INSTITUTES.

A series of highly successful agricultural meetings are now being held in various parts of the province of New Brunswick. An interesting feature of these meetings is the part that is being taken in them by farmers' wives and daughters. For a number of years several of our lady correspondents have been advocating, through our columns, for the organization of Women's Institutes, along the lines followed in Ontario. One of the strongest advocates for this cause that we had was Mrs. Jas. E. Porter, Andover, N. B., and we are glad to note that her wishes are being fulfilled as will be seen by the following account of the first meeting of the series held at Andover, N. B., on the 12th inst. :

"Yesterday was a field day with the farmers in and around the village of Andover, who assembled with their wives at Beveridge's hall and the residence of Wanan James to hear addresses and witness demonstrations from the institute speakers, sent by the local government. W. W. Hubbard, secretary of agriculture, accompanied the speakers.

"The speakers were Mr. Elliott, from Ontario, who visited this locality last year, and his daughter, whose special mission was to tell of the work of Women's Institutes in Ontario and to induce the farmers' wives of the province to organize and take up the work; Mrs. A. E. Dunbrack, of the department of agriculture, Fredericton, to instruct on cooking, hygiene, etc., and Seth Jones, the provincial poultry expert.

"At 3 o'clock the ladies held a meeting in Beveridge's hall to listen to Miss Elliott and Mrs. Dunbrack, and the gentlemen accompanied Mr. Elliott and Mr. Jones to the barn, where Mr. Elliott talked on the different field crops and emphasized the raising of corn and the use of the silo. His address was very interesting.

"The result of the meeting in the hall was that Miss Elliott enthused the ladies with the necessity of taking up institute work as was being done in Ontario, that they organized themselves into a Ladies' Institute and chose the following officers : Mrs. James E. Porter, president; Mrs. D. W. Pickett, vice-president; Mrs. J. E. Wright, secretary-treasurer. An enrollment of twenty members. Meetings are to be held on the first Wednesday in the month.

"After the organization of the institute the audience was entertained by an interesting and instructive address from Mrs. Dunbrack on hygiene, and the importance of well cooked food, and gave a demonstration of the best methods of cooking meat, which was highly appreciated by those present.

"In the evening a meeting was held in the hall, which was addressed by Mr. Hubbard and the institute speakers. J. E. Porter, ex-M. P. P., occupied the chair. Mrs. Dunbrack spoke on the Woman's Institute as a means of improving the social life of the community; Miss Elliott spoke on What Young Canadians Should Read; Mr. Jones urged the claims of poultry as a money maker on the farm, and Mr. Elliott wound up the meeting with an earnest and eloquent plea for a higher and truer education for the boy on the farm.

"The ladies brought baskets and had a social picnic supper that was enjoyed by all.

Similar encouraging reports have reached us in regard to meetings held in other sections.

THE MARITIME FARMER wishes the good cause every success and trust that the ladies of the Maritime Provinces will ere long be an united body, working for a common cause.

THE FARM ACCOUNT BOOK.

Every farmer ought to consider that what is making his neighbor money may not be adapted to his own cause, and here is where the farm account book should be the guide board.

Many a farmer would find, by keeping a strict account of the cost of feeding his dairy herd, that his cows are not even paying for their keep; while another farmer would find them the most profitable branch of agriculture.

And the same is true of every other business on the farm—cropping, stock raising, poultrying and fruit raising. Sometimes the failure or success is a result of individual management; sometimes it is a result of marketing facilities, soil conditions, and a dozen other reasons, but in all cases, the keeping of an account book will show concisely and clearly whether one should continue in any line of work or choose another.

WEEDS ARE ROBBERS.

Wherever there are weeds in the fields there can always be expected correspondingly lighter crops. The weeds take plant food and moisture from the soil which should be conserved for the crops, and in many other ways they are detrimental.

In order to fight weeds to best advantage they should be studied and their habits understood. When one has an enemy of any kind it is always desirable to learn its name and as much about it as possible, so as to be able to take advantage of any weak point. Just so with the weeds. They are our enemies. We should know their names so that they may be discussed intelligently. Their habits should be well understood so that advantage may be taken of their characteristics in combating them.

"GOD SAVE THE KING."

On the opposite page will be found photos of their most Gracious Majesties King George Fifth and Queen Mary, who were crowned on the 22nd inst. Appropriate ceremonies were held in all parts of the British Empire to commemorate the important event and the unanimous heart felt expressions on the lips of all their loyal subjects was and is "God Save Our King and Queen."

EDITORIAL NOTES.

The time to advertise is before the other fellow gets ahead of you. The time to advertise is all the time.

Have a purpose. No one ever reached great things without trying for them. Thoughts of what is great, love for great ideals, daily acts done in a great spirit, prepare the hero's hour and brings it to him. Purpose makes or mars life. Purposelessness ruins life.

Enthusiasm is the power behind the throne of success. Enthusiasm exalts the mental faculties, and we think better, invent more, are more resourceful and accomplish things. An enthusiast never says a thing cannot be done—he does it. Obstacles never stop a man filled with enthusiasm, because he uses them as stepping stones to accomplish great results. The enthusiastic man does not watch the clock.

Before locating any buildings on the farm or before making any changes, give the subject careful study for there is a great advantage to be found in the well arranged farmstead. The buildings will stand where they are put a great many years and they should be arranged as economically as possible.

It requires about the same amount of feed to produce one pound of flesh on a steer as it does to make one pound on a sheep, but sheep will thrive on weeds and grass that cattle will not touch, and besides, they produce a clip of wool every year in addition to the mutton.

Those who persist in living as their fathers did and in farming like they did a century ago will soon be so far behind the procession that they will give little trouble. Let them drop behind and get out of sight.

There seems to be an impression that anyone can run a dairy but the people who start out with that idea soon find that it takes just as much wisdom and business sense to manage a dairy as it does to carry on any other line of work.

Give earnest heed to all the things that have been said in favor of good cultivation lest at any time you let them slip.

How Can Alfalfa Growing Receive a Boost in the Maritime Provinces?

Alfalfa Meal.

One of the novel manufacturing developments of the West has been the establishment of alfalfa meal mills throughout the alfalfa growing country. The chief market for the product of these mills has been in the East and Central West, where wheat bran is a standard dairy cow feed.

Alfalfa is so nearly equal to bran in its nutritive value, and can be bought where it is grown for so much less, that there has been a good field for capital in reducing it to meal and shipping it in sacks to sections where it is not grown.

Coincident with the development of this trade have come numerous inquiries as to whether it will pay a farmer who grows alfalfa to cut or grind the hay for feeding on his own place, or whether it will pay him to haul his hay to a nearby mill and have it ground.

In response to these inquiries, the Colorado Agricultural College has conducted experiments with cut or chopped hay for a number of years, and is now entering upon a series of experiments with ground hay.

These experiments are being carried on with steers, lambs and shoats, and the object is to find whether there is enough saving in nutritive material in the meal, or enough additional gain made by the animals consuming it, to more than pay the cost of grinding the hay.

Three lots of yearling Hereford grade steers, 10 in each lot, are being fed on rations precisely alike, save that one lot gets whole hay, anather lot cut hay, and the third lot ground hay.

Three lots of lambs, 100 in each lot are being fed on a similar plan. And four lots of spring shoats are being fed to test the value of alfalfa meal for fattening hogs. One lot is being fed corn and wheat shorts, equal parts by weight; another is being fed ground alfalfa hay, one part, and hulled barley, two parts; a third is getting ground alfalfa hay, one part, hulled barley, four parts; while a fourth lot is on ground alfalfa hay, one part, and hulled barley, six parts.

These experiments will give a good idea as to the relative value of ground, cut, and whole hay. They will be repeated in order to assure correctness in results, and it is believed that they will furnish much needed knowledge concerning the value of ground hay.—G. E. Morton, Colorado Agricultural College.

King George V.

Queen Mary.

CROWNED JUNE 22nd, 1911.

Heart Trouble

Caused Dizziness, Weakness and Smothering Spells.

Through one cause or another a large majority of the people are troubled, more or less, with some form of heart trouble. Wherever there are sickly people with weak hearts, Milburn's Heart and Nerve Pills will be found to be the most effective medicine on the market.

Mrs. F. Leslie Craig, 114 Erie Ave., Brantford, Ont., writes:—"It is with the greatest of pleasure I write you stating the benefit I have received by using Milburn's Heart and Nerve Pills. I suffered greatly from heart trouble which caused dizziness, weakness and smothering spells. I used a great deal of Dr.'s medicine but received no benefit. A friend advised me to buy a box of your pills, which I did, and before I had finished one box I felt so much better I co inued their use by taking two boxes. I highly recommend these pills to any one suffering from heart and nerve trouble."

Milburn's Heart and Nerve Pills are 50 cents per box, or 3 for $1.25, at all dealers, or mailed direct by The T. Milburn Co., Limited, Toronto, Ont.

HORTICULTURE

Conquering Potato Blight.

When one puts to me the blunt question, can potato blight be entirely eradicated in one's field or not? I answer yes and no. There are seasons when the weather conditions are favorable and spraying is thoroughly and scientifically adhered too, that no signs of blight will appear on the sprayed field. This will involve spraying five times, beginning when the potatoes are but a few inches out of the ground, by spraying every two weeks this will cover about three months, allowing for weather conditions, this is all that can possibly be done in one season. On the other hand there are other seasons when the conditions will not permit five sprayings. Every spray, however, is effectual if not followed by hard rains

WHAT IS LATE BLIGHT.

I have received so many inquiries on the matter of late blight or rust that the following statements seem timely; this disease is caused by a fungus, a kind of mildew, which is carried through the winter in seed potato and so far as known only in this way. Where such affected potatoes are planted the fungus develops in the potato shoots and finally causes the blight of the leaves, provid weather conditions are at all favorable. The germ or spores are produced in enormous numbers on these blighted leaves and by these the infection is spread to the neighboring plants. Many of the spores fall to the ground also, and invading the tubers, cause the rot. Spraying with Bordeaux kills these spores, and so prevents both blight of the leaves and the rot of the tubers.

TWO KINDS OF ROT.

Many potato growers do not understand that there are two different kinds of rot, and that while the old fashioned soft rot is certainly preventable by spraying, the dry rot is not preventable by spraying. As a consequence, some have condemned the spraying of potatoes as a failure. I believe that the spraying of late potatoes with Bordeaux is a profitable operation and that it will prevent early blight and rot blight, blight and discourage flea beetles, but it should be borne in mind that there are other blights and rots of the potato which cannot be prevented by spraying.

DRY ROT PREVENTION.

To prevent dry rot we must depend upon the rotation of crops and the use of healthy seed. Where dry rot has been prevalent potatoes should not be again planted for three or four years. The selection of seed also is important. Do not use seed from bins in which many of the tubers are affected with dry rot; and in all cases before planting, the tubers should be given either the corrosive sublimate or the formalin treatment as for scab. Either treatment will prevent the introduction of scab and lessen the liability to dry rot and the various forms of decay which attack the seed tubers.

Use one ounce corrosive sublimate to seven gallons water and soak the tubers one and one-half hours. For the formalin treatment, mix one-half pound formalin with 15 gallons water and soak the tubers two hours.

A FIVE YEAR SPRAYING TEST.

For five consecutive years of testing, potato spraying has proven a profitable practice with me. The test of 1906, was in my part of my state the least favorable of the five for the development of the principal potato diseases, late blight and rot, yet even in that year the test showed good returns for the money expended and labor applied.

The following will show the profit of five years' experiment with one acre of sprayed potatoes, as compared with one acre of unsprayed:

Notice that the final results of spraying show an average gain of 90 bushels of potatoes per acre and an average profit of $50.44 per acre. Any farmer can test these figures by planting one acre of ground for two or three years so as to allow for seasons when late blight and rot are less prevalent. The whole acre should receive the same attention as to the work and fertilization, except that one-half must be sprayed anywhere from two to five times. The unsprayed must also be kept free from bugs to warrant a fair test.

As the average expense of spraying per acre for the five years was only $2.84, which includes all material and labor, it ought to convince every grower of potatoes that it is a much better paying crop when spraying is thoroughly and scientifically practiced. Also take notice that the profit per acre each year above all expenses was $47.60.

Bordeaux mixture is the only remedy used, except Paris green for bugs, which must be used on the whole acre each year. The poison can be used in the Bordeaux mixture, thus concentrating the work and lowering the cost between the sprayed and unsprayed plots.

Some one man in the neighborhood could make a business of spraying and secure enough fields to keep him busy throughout the season. This plan combines several advantages. The farmer need not learn how to spray, one outfit will do for a considerable area, the materials can be bought in large quantities, and there by more economically, the professional sprayer will become expert and do the work better and faster than the grower himself and the farmer will be relieved of all extra work connected with the spraying.

Year.	Price per Bu.	Sprayed Acre. No. of Sprays.	Cost.	Bu. per Acre.	Value.	Unsprayed Acre. Bu. per Acre.	Value.	Gain per Acre. Bu. per Acre.	Value.
1903	$0 50	2	$2 10	$2 54	$127 00	160	$ 80 00	94	$47 00
1904	45	4	4 00	2 88	129 60	180	81 00	108	48 60
1905	60	3	2 85	2 56	153 60	140	84 00	116	69 60
1906	55	5	4 25	2 70	148 50	220	121 00	50	27 50
1907	70	1	1 00	2 40	168 00	155	108 50	85	59 50
Average	56	3	$2 84	$2 61	$145 34	171	$94 90	90	$50 44

TIME TO SPRAY.

Finally, if thorough spraying is the object it would be best to begin when the plants are 6 or 7 inches high and to spray every ten days or two weeks thereafter as long as the plants remain green. If rain comes before any application is dry on the vines, the treatment should be repeated; but spraying should not be stopped because it looks like rain. Just after a rain, especially a warm rain followed by muggy weather, blight spreads fastest and the plants most need protection. It requires only a short time for the mixture to dry on the vines and then it takes a heavy shower to wash it off. Every effort should be made to complete the spraying before the rain comes. If only three applications are to be made during the season, delay the first until it is necessary to treat the potatoes for the beetle or slugs, or shortly before the middle of July. In no case should one deliberately wait until blight appears; but if this has been done and the spread of the disease is not rapid when first discovered, a single application may do much to preserve the remaining foliage.—Sylvanus Van Aken in Successful Farming.

New Idea in Orcharding.

A feature of the apple industry in Nova Scotia ever since it commenced to assume large proportions has been the purchase by speculators of apples on the trees. This method of marketing has been embraced by many fruit growers, who have found it advantageous because it gave them an asssured income without having to worry about market fluctations or even to bother about picking and barreling. Possibly the growth of co-operation in the marketing of apples will have a tendency to check this custom; for while the farmer who sells his crop on the trees and lets the speculator take the risk knows exactly what he is getting for his apples often before they have ripened, there is a disposition for farmers to join hands in the enterprise of marketing. The principle of co-operation, we understand, has been more extensively adopted in this province than anywhere else in Canada, and it is working advantageously in raising the standard of Nova Scotia pack and in securing the most satisfactory returns for the farmers. But now a new idea is making its appearance in the orcharding industry. It has not shown itself in Nova Scotia, so far as we are aware, but it is a marked feature of the industry in Ontario this year. We refer to the system of letting orchards on rental. In addition to this many apple dealers have changed their methods, and instead of buying the fruit in the orchard as in former years they have proceeded to rent the orchards. It is said this has been done on so large a scale that it cannot fail to materially affect the quantity and quality of apples produced in Ontario orchards. Nearly all such rented orchards will be thoroughly sprayed and many of them have been pruned. In

Vanco

LEAD ARSENATE

Is better, in every way, than any other spray for Worms, Codling Moth, Potato Bugs, Asparagus Beetle and other leaf-eating insects.

VANCO sprays easier, sticks to the leaves better, does not burn the foliage, and always kills the insects. Contains guaranteed amount of Arsenic Oxide — of uniform strength and highest quality.

PILES CURED at HOME by New Absorption Method.

If you suffer from bleeding, itching, blind or protruding Piles, send me your address, and I will tell you how to cure yourself at home by the new absorption treatment; and will also send some of this home treatment free for trial, with references from your own locality if requested. Immediate relief and permanent cure assured. Send no money but tell others of this offer. Write today to Mrs. M. Summers, Box P. 309, Windsor, Ont.

Chamberlain's Cough Remedy is sold on a guarantee that if you are not satisfied after using two-thirds of a bottle according to directions, your money will be refunded. It is up to you to try it. Sold by all dealers.

most cases there is a stipulation for cultivation of the ground as well. We draw attention to this as a new idea that may ultimately enter into orcharding in this province. Still another feature to notice in connection with it is the influence it may have on crop estimates. Only the less progressive orchardists are likely to do business with their trees in this way, which being the case, it means that many orchards more or less neglected in the past will be better cultivated and made consequently more productive. The same thing would obtain in Nova Scotia in case the same system were to come into vogue. If all the trees now producing were cultivated as they ought to be the apple production of the Annapolis Valley would no doubt show an immediate increase.—Maritime Merchant.

Why Plants Wilt.

If you cut a flower off and put it in a glass of water it keeps its head up pretty well for a long time. If you do not put into water at once it wilts. Why? In the first place the plant takes up water and keeps stiff and erect. In the second place, it wilts because it can get no water, and what is in the plant soon leaves through the stomata. That is, the water is pumped out by the dry air and with none to replace it, the plant wilts. Water is all that keeps tender plants or tender parts of trees from wilting or collapsing.

Force water through a hose and it has a tendency to straighten out. Cut off the water force and it collapses. This is exactly what happens when a plant fails to get enough water.

Severed grass soon becomes good hay if it is handled right. Try this for a lesson in hay making. Cut a handful of clover and put it in the hot sun to dry. Put another handful in the shade where it can't dry out so fast. In three hours see which is the best hay. Take the handful of hay and twist it in your hands. In one case, the sun-dried hay will have brittle leaves and green, juicy stems, whlie the shade cured hay will be more thoroughly cured and not be so britle. It is the best hay and will keep best. Why?

Well, the sun dries the leaves to a crisp the first thing so they can't pump the water out of the stems. The shade-cured hay had a chance to stay green long enough to quite thoroughly pump the water from the stems through the leaves before they wiltedf

So if you want good hay don't lay it out thin in a hot sun. Better soon rake it into loose windrows so the bulk of it will be shaded and the wind can go through. Any hay will keep if it is cured so you can't wring any juice out of the stems when you twist a handful.

Orchard Cultivation.

The neglect of farm orchards throughout the country accounts very largely for the fact that the crop of apples decrease in some orchards.

It is a recognized fact that orchards require more care and attention to produce good fruit now than formerly. Good, healthy, vigorous trees are less susceptible to injury by insects and diseases than weak trees. Cultivation is the most essential factor in producing good trees and fruit.

The principle reason for cultivating an orchard is to conserve the moisture both by establishing a dust mulch on the ground and by keeping the weeds down. Cultivation should not begin in the spring until the trees have started to grow, otherwise you may force out the tender growth which may be injured by cold.

In cropping a young orchard always

A Dirty Carpet Or a Clean Painted Floor! WHICH IS BETTER?

You KNOW which YOU would sooner have. You know which LOOKS the best and is the easiest to KEEP clean. Better decide now to freshen things up right away with a tin or two of M-L Floor Paint.

M-L MAPLE LEAF

You should use M-L Pure Paint to paint anything that needs painting. It protects the surface covered better and longer than most other paints. You buy it in tins—all ready to apply. Made of guaranteed pure materials, mixed with twenty years' knowledge of paint-making for practical painters.

Think what a difference a few dimes' worth of M-L Pure Paint would make about the house. It would make some of the wood-work look like new—or a worn-bare, shabby-looking floor made spic and span as when you first walked on it with M-L Floor Paint.

PURE PAINTS

Paint the WALLS and CEILINGS with M-L Flat Wall Colors. You'll find it far easier to keep them clean and sanitary as well as brighter looking. Easiest to apply. The colors are clearer and brighter; keeps its FRESH LOOK longest. Artistic, sanitary, durable, washable and VERY economical.

M-L Is The Most Economical Paint You Can Buy

Made in forty-seven colors for every paint purpose by Imperial Varnish & Color Co., Limited, Toronto. Sold by dealers who believe in giving you your full money's worth.

SHARPLES

Tubular Cream Separator

The cheap machine will more than lose the price of a Tubular the first year. Many thousand users of cheap separators are discarding them for Tubulars. The cheap machines lasted one year on the average—required ten to thirty dollars repairs—and lost more in cream than the original cost.

Do you call that "cheap"?

Tubulars have twice the skimming force, skim faster and twice as clean as others. Dairy Tubulars contain no disks or other contraptions. Wear a lifetime. Guaranteed forever by the oldest separator concern on this continent. The biggest economy you can make is to buy The World's Best.

Why spend money for some cheap machine? Separator quality is more important than first cost. Our local representative will show you the Tubular. If you don't know him, ask us his name.

Write for catalogue No. 194.

Sharples 30 Yrs

THE SHARPLES SEPARATOR CO.

Toronto, Ont Winnipeg, Man.

leave plenty of space between the crop and the young trees for cultivation and as the trees grow older widen this area.

In old orchards, no crop should be planted in the spring and in case a cover crop is on the ground, it should be turned under. The first cultivation of an orchard should be about four or five inches deep, followed by a harrow so as to pulverize the soil. In case of large trees, the disc harrow, and preferably the extension reversible disc, is best adapted to the first one or two cultivations. The subsequent cultivations should be such as to keep a good soil mulch on the soil throughout the summer in dry sections of the province, or dry seasons. In moist sections or seasons it is advisable to plant a cover crop the latter part of the summer to remain on the ground the following spring.

DAIRYING.

A Commendable Score Card.

The score card is coming to be something of a factor in dairying these days. There have been many attempts made to devise a sensible method of scoring. As a farmer, I am somewhat doubtful as to what kind of a scoring system is most desirable. Possibly one that is most readily and reasonably applied and is the most readily understood is the best. The accompanyimg card is in use by the Borden Condensed Milk Company and has the recommendation of being understandable and reasonably brief. With this card it is difficult for two people to score greatly different in desiring to score according to directions. True, there are items that a person might construe rigidly or in a more lax manner, as for instance, the matters of good health, clean cows, clean windows, etc, also good flesh. As a whole it seems to be about as reasonable as anything I have noticed.

The policy of the company seems to be reasonable in applying the score. I have not seen very much use of the card, but what I did see could hardly be criticised severely. In one barn I saw a few cobwebs and was curious to learn how this matter of cobwebs would be treated. I was informed that this barn had not been whitewashed for nearly six months, and that it would be whitewashed inside of thirty days. The cobwebs and dirt were not bad, the inspector said, and he would score the stable as a clean one. If he were to find such a condition within a short time after the stable had been whitewashed he would be more severe in the score, or if it were not to be cleaned shortly he would score closer. If that method of common sense adjustment could be carried out in all such work and, particularly, if there could be some cool-headed advice and consultation between the man with the score card and pencil and the man with the cow there would be a good deal less of friction that we now hear in some quarters.

Below is given a copy of the score card referred to. The dairies where this is used are supposed to score somewhere from 85 p. c. to 100 p. c. I think that some dairies may not reach even 85 p. c. but if not I should expect there would be some missionary work undertaken shortly.

SCORE CARD.

COWS.

If in good health, 10; one point off for each 10 p. c. or fraction thereof found diseased.

If cows are clean, 10; if one or more are dirty, 0 (——dirty).

If cows are in good flesh, 5; if poor 0.

STABLES.

If thoroughly clean including windows, 8; otherwise, 0.

Cubic space, 100 cubic feet, per cow, 5; one point off for each 800 cu. feet per cow under 500.

Ventilation—outlet shaft and inlet pipe, 7; outlet shaft only, 4; neither, 0.

Window area—4 square feet per cow 5; one point for each 20 p. c. less than 4 square feet per cow.

Thoroughly whitewashed, 5; 50 p. c. whitewashed 2; less than 50 p. c. whitewashed, 0.

Cement floor ( ), good condition, 5; poor condition 0; plank ( ), stone ( ) floor, good condition, 3; poor condition, 0. Dirt ( ) floor, 0.

Manure hauled on fields daily, 5; removed at least 30 feet from stable and piled so cows can not get at it, 3; within 30 feet of stable or where cows can get at it, 0.

WATER SUPPLY.

For cows. Spring ( ), stream ( ) or well ( ) water, if unpolluted, 10; otherwise, 0. From buckets ( ) in stables, if clean, 3; otherwise, 0; from pond with no outlet, ( ) 0.

For milk house. Running water, pure and clean, 5; otherwise, 0. Still water ( ) pure and clean, 2; otherwise, 0.

Any danger of water becoming contaminated? If so what?

MILKHOUSE AND DAIRY UTENSILS.

Milk house not attached to any other building ( ), if clean, with tight sound floor, and lighted and ventilated, 10; otherwise, 0; or

Attached to another building (! under good conditions specified above 6; if otherwise, 0; or

Built in an ice house ( ) under good conditions specified above, 4; otherwise, 0 or

Opening from another room or building ( ), 0; or if no milk house ( ) 0. (Half score allowed ( ) if house is deficient in light only.)

Proper pails and strainers used for no other purpose, kept clean and kept in milk house or on suitable outside rack when not in use, 5; if otherwise 0.

Proper care of cans on return from factory, 5; if improperly cared for or used for any other purpose whatsoever, 0.

Total Score,

Remarks and suggestions by veterinarian.

Remarks and suggestions by superintendent.

It would be difficult to devise any score that would not be criticised. Foe example, it might seem that a milk house attached to another building, under good conditions, ought not to be cut in scoring. Also if built with an ice house under the same good conditions, there should be no complaint. This score card is the result of much practical experience and is therefore entitled to special consideration although not, of course, beyond criticism.— Hoard's Dairyman.

Cow's Udder a Manufactory which Produces while you work.

Most persons think that giving down or holding up the milk by the cow is a volunatary act," says John Burroughs, the well-known naturalist. "In fact, they fancy that the udder is a vessel filled with milk, and that the cow releases or withholds it just as she chooses. But the udder is a manufactory; it is filled with blood from which the milk is manufactured while you milk. This process is controlled by the cow's nervous system; when she is excited, or in any way disturbed, as by a stranger, or by taking away her calf, or by any other cause, the process is arrested, and the milk will

WINDSOR TABLE SALT

Salt goes in or on practically everything we eat—which shows the importance of using only pure, wholesome salt.

Windsor Table Salt is pure salt—all salt—and nothing but salt. It is the standby in all Canadian homes. 35

ALFRED STOKES,
General Secretary.

not flow. The nervous energy goes elsewhere. The whole process is as involunatry as is digestion in man, and is disturbed or arrested in about the same way."

The Milk Escutcheon.

In an article under this heading published in the Rural New Yorker, F. G. Taylor says: The escutcheon or milk mirror was first discovered by M. Guenon, a Frenchmen. In studying the anatomy of cows in regard to the production of milk, he concluded that the milk was dependent upon the circulation of blood to a certain extent and that the large artery that supplies the blood to the region of the udder must be in proportion to the amount of milk produced. This has been borne out by later studies given the matter by learned men. This artery also supplies blood to the skin around the udder and the posterior region, and in consequence the hair on these parts is soft and short. If a person would stand behind a Jersey cow and, holding her tail to one side, study the hind portion of the animal, he will soon notice two lines made by the hair growing in different directions. These lines commence near the perineum and extend downward and outward to a point on the thighs, then turn sharply and pass inside the legs, extending under the belly. The two lines form a shield in shape, from which the name escutcheon is taken. For a good milker this escutcheon should be large, wide at its corners where the hair lines change directions, and should extend well towards the front quarters.

It is generally thought by those using this system that the width of the shield at its widest point denotes the amount of milk and the length, the deep milking quality of the animal. That is, a cow showing great width of shield and the lines joining just forward of the udder, would give a large amount of milk, but would be more apt to go dry sooner than a cow having lines extending well under the body.

A Common Sight.

Prof. R. M. Washburn of the Vermont Experiment Station asks if we ever saw a farmer get up in the morbing, and, without washing, take two pails of swill from the house to the hog house, handle the tools contained in the hog house, then go to the horse stable, spank the horses over, feed them grain, curry them and possibly harness them, then go to the cow stable and after catching and tying up a calf, sit down to milk without washing his hands. I say: Did you ever see him do all this without washing his hands? I have, we all have, and we all know that to milk absolutely dry handed is exremely difficult on may cows, and hat not infrequently the lower portion of the hands becomes well ashed during the milking process. Where does that dirt go? Into solution in the milk and being in solution it cannot be strained out hrough any amount of cheese cloth r even absorbent cotton.

Now imagine with me for a moment that the good housewife beat ggs, mix cake, knead bread or did ny other similar piece of food work regularly in so dusty and ill-favored place as the ordinary cow stable. ow many of us young men would e willing to marry into that famy? As a matter of fact, however, the detrimental effects which could possibly result from such work, which we would immediately pronounce fearfully dirty, would be nothing of consequence, for the reason that all these foods are thoroughly baked and thereby sterlized before being consumed, whereas milk is consumed raw.—Maine Farmer.

Cream Profits That Stay in Your Pocket

Empire Disc

THERE was a time when the first cost of a cream separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necesary. Men have learned that in the

Frictionless Empire

Empire Line
Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest returns for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

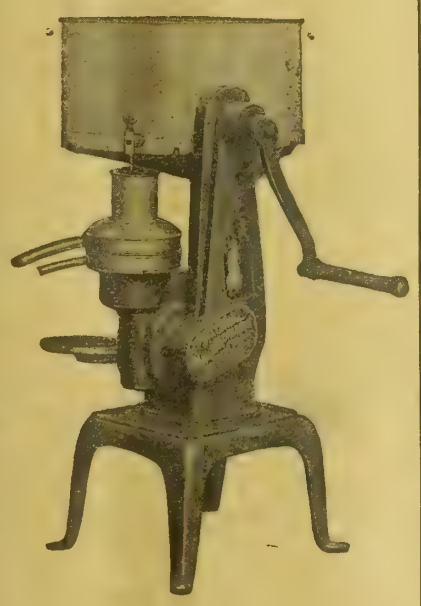
Seventeen cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

Empire Cream Separator Co. of Canada, Ltd.
Sussex, . . New Brunswick
Farmer Agents Wanted in Unrepresented Districts.

THE CAPITAL CREAM SEPARATORS.
THEY MAKE COWS EARN MORE.

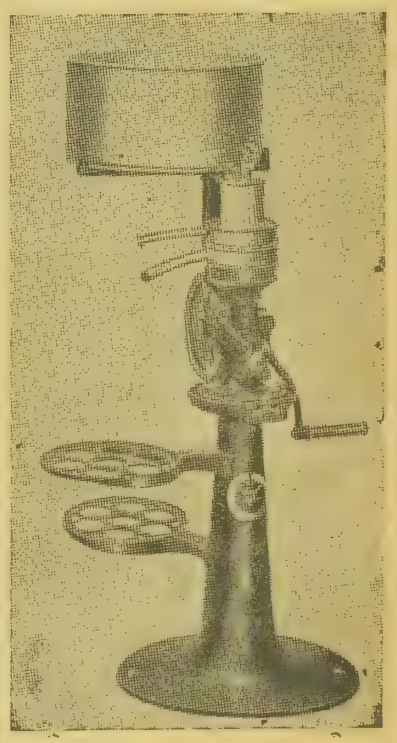


STYLE A—Made in 2 sizes, Nos. 6 and 8. Capacities, 500-750 lbs. per hour. Ball Bearings used throughout. Splash system of oiling. Tank 36 inches high.

We now have to offer two types of The Capital as the cuts show, yet the same bowl is used in either machine. The Capital bowl is acknowledged to be the lightest, most compact, easiest washed bowl on the market. It weighs less than four pounds—has five parts—can be taken apart, washed and assembled in a couple of minutes. This bowl, in the Capital Separator, is partly responsible for the Capital winning 20 PRIZE AWARDS since 1901, in the countries of Denmark and Sweden—the real dairy countries. The Capital is the easiest separator, of equal capacity, to operate—it is the only woman's separator on the market. The light, easy running bowl, together with the arrangement of the strong simple gears, make it the easiest running separator, and last, but not least, the Capital is a close, clean skimmer. This we guarantee.

Both styles equipped with the Capital clutch device—the gears stop running instantly when you drop the handle. We save YEARS with our GEARS by saving all the running down wear. A postal will bring you full particulars. Address nearest branch.

The National Manufacturing Company, Ltd.,
Maritime Branch—MONCTON, N. B.
OTTAWA, REGINA, SASK.
TORONTO, EDMONTON, ALTA.



STYLE B—Made in 2 sizes, Nos. 3 and 5. Capacities, 350-500 lbs. per hour. Phosphor Bronze Bearings and Bushings throughout. Tank, 44 inches high.

We will accept other makes of Separators in purchase price of the Capital.

FEEDING BRAINS

Why Studious Children Always Crave Oatmeal

Nature gives oats more organic phosphorus than to any other grain she grows. And phosphorus is the brain's main constituent. Brains can't grow, brains can't work without it.

Oats also contain more lecithin—the nerve food—than any other grain. They form our greatest energy food.

That's why growing children love oatmeal. Some instinct within them calls for these elements, and woe to the child who doesn't get all it wants.

The right oats for food are the rich, plump grains. In the choicest oats there are but ten pounds to the bushel. In making Quaker Oats these choice grains are selected by 62 separate siftings.

Quaker Oats—just the cream of the oats—costs but one-half cent per dish. One dish is worth two dishes of common oatmeal. Don't you think it would pay to serve your children such oats?

Made in Canada. (172)

LIVE STOCK

Preparation of Show Yard Animals.

There is no season of the year at which a few moments spent in connection with this all-important subject could be spent with better advantage. We start next month upon a series of shows throughout the whole length and breadth of our country, at which the best and the most typical collections of breeding stock to be found within the districts represented by these particular shows are exhibited. From a general acquaintance with agricultural societies, and a personal knowledge of a good many, the main object, or at any rate, one of the principal objects set out in the rules of these societies is to encourage in every way possible the breeding of good stock in their respective districts.

ITS INFLUENCE ON PRODUCTION.

Yet it must be manifest to every stock owner that this object is not being carried on in the manner in which it ought to be, for one's experience proves that in the majority of cases the animals exhibited as breeding animals are in a condition which every practical man will agree renders them almost entirely unfit for stud purposes. A case has just come to our notice out of many similar ones. Two rams were purchased for stud purposes last season, one costing considerable over the century with the result of half-a-dozen lambs from forty-five ewes, the other costing over thirty guineas, with the result of no lambs at all. These rams were too fat and too heavy to do their work properly. Instances of a similar character as to the want of fertility could be readily adducted in respect to stallions, bulls, mares, cows and heifers. Inquiry would bring to light a number of heifers which, having won prizes as yearlings and two-year-olds at breeding fat stock shows, finish their career at the Christmas stock shows in a class for heifers not exceeding three years of age. Is this wise, and is it in the best interests of the production of sound, healthy breeding stock? Certainly not. Experience shows that not only in a general sense is the pure bred stock of this country less vigorous and less sound in its constitution than it was some twenty or twenty-five years ago, but the proportion of live produce resulting from the use of show-yard animals at the stud continues to become less and less.

PAMPERED STOCK.

Let any supporter of the present-day show-yard system refer to the stud books and flock books and ascertain from the owner of a particular animal the number that ought to have been the produce of such an animal, and then find the actual number sired by such animals. The result will be clearly in favor of our contention that the unnatural and undue forcing, pampering, and general treatment pursued in respect to the exhibited animals at the present day tends to diminish their utility and value in respect to stud purposes.

It will be said, you cannot expect men to exhibit animals in the ordinary store condition; they would not be attractive; and many other similar reasons would be given. Quite so, and no one desires for a moment that animals should be exhibited in the condition which is generally covered by the term "store condition." But there is a vast difference between good condition and the present-day over-fed condition that is typical of so many of the exhibits. It is not so much in the quantity of flesh that the animals carry as in the general course of treatment. Right from birth the promising animal is pampered; it never knows what it is to get its own living. Everything that can induce it to thrive and develop is given it, and every protection against anything that is likely to delay or retard its full growth. Can one wonder, then, that when the animal has finished its show-yard career and has to be sold for actual work, so many of them fail?

INSURING SHOW STOCK.

Another means of testing the real value of this unnatural course of treatment is afforded by the brokers insuring livestock. These gentlemen could disclose some pretty striking facts as to the liability to die of such kind of stock. Many say that the rates charged to cover the risks of show-yard preparation and exhibition are very high, but they fail to realize that the fact of their being high goes to prove how heavy the losses are, and it is these heavy losses that emphasize the unnatural course of treatment that such animals undergo in order to fit them, according to the present idea for making a creditable appearance in the classes for which prizes are given.—Agrestis, in Farm and Home.

The Farrowing Sow and Litter

The question whether at farrowing time the sow should be left to her own devices or assisted in any way by taking charge of the little pigs until birth-giving is complete, is very much debated. In many caset the sow farrows during the night, and is found with her pigs all right and quite comfortable in the morning; but it is not always so, and hundreds of young pigs are lost, and not a few sows sacrificed for want of the presence of a capable attendant. It is certainly an advantage to have an experienced man at hand while the sow is farrowing, but there are many evils associated with untimely or undue interference. If the sow has farrowed all right, she should be fed in much the same way as during the closing days of gestation. It is a great mistake to "feed for milk" before farrowing, and equally an error to begin to stuff the sow with milk-producing food immediately afterwards. The inexperienced breeder thinks he must brace up his sow with plenty of good food to meet the demands on her system, and produce plenty of milk on which the young pigs can grow and thrive. This is all right in theory, but experience goes to show that it is a poor sort of sow, and one that ought not to have been bred from, which does not at the start produce enough milk for her pigs without any extra or special feeding. The time for this is later on when the pigs are growing and require a large quantity of rich milk to satisfy their increasing demands, and in providing which, if not assisted by better food, the sow is dragged down in condition

To commence this high feeding directly the pigs are born is not only unnecessary, and therefore wasteful, but injurious. It really defeats the object in view, for it over-stimulates the milk glands and inflames the udder, while the effect on the little pigs is to make them sick, and to cause "scouring" and liver derangement, to which young pigs are very prone. The majority of cases of so-called milk fever in sows, in which the secretion disappears altogether, and leaves the youngsters practically motherless, are due to high or over-feeding prior to and immediately af-

INTERNATIONAL COLIC REMEDY

SOLD ON A SPOT CASH GUARANTEE

We Refund Your Money If It Ever Fails.

COLIC MAY KILL YOUR HORSE or Cow within one hour unless you have this remedy ready for instant use. Colic kills more horses than all other diseases combined, and when you need a remedy you must have it at once, for if you wait for a veterinary or make a trip to town you may find the animal dead when you return. If International Colic Remedy ever fails we will refund your money. It is the only Colic Remedy ever sold on such a strong guarantee. Put up in a regular drenching bottle.

SAVED HIS FILLY

St. Jovite, Que, March 3rd, 1911.

International Stock Food Co., Limited.

Gentlemen,—I am glad to say I used International Colic Remedy on what seemed to be a hopeless case and saved a beautiful filly—she was cured in a few minutes. (Signed) CHARLES ST. AUBIN.

PRICE 50c. AND $1.00 PER BOTTLE. FOR SALE BY DEALERS EVERYWHERE

INTERNATIONAL STOCK FOOD CO., Limited, TORONTO, CAN.

Sickness is usually caused by the accumulation of waste matter and impurities within the body.

BUILT WITH CONCRETE BLOCKS MADE ON "IDEAL" FACE DOWN MACHINES

Grain Bin, built of Ideal Concrete Blocks, for The Marine City Roller Mills Co, Capacity, 5,500 bushels of wheat. Cost complete only $860.

Even if you are going to build only one barn, silo or grain bin, it will pay you to buy an Ideal Concrete Block Machine.

It will enable you to make your own building material right on the spot, saving long hauls and delays.

You can make the blocks yourself, saving labor.

And you will have a building that will be absolutely fireproof, and last for all time without a cent for repairs.

An Ideal Machine will save you many times its cost, and enable you to have buildings as durable as stone for ⅓ the cost of brick.

Write for catalogues. 11

IDEAL CONCRETE MACHINERY CO. LIMITED

and the number of times of feeding increased.

An important feature in the successful management of the sow and litter is to get the little pigs to feed as early as possible. This pays in two ways—it saves some of the drag on the sow, and it gets the pigs fit to wean earlier, and so the sooner releases the sow from her maternal duties, a matter of no small importance where it is desired to take two litters in a year, and have them both at favorable seasons. Moreover, when the pigs are removed from the sow those that have been taught to eat are much better fit to do without her milk, and they are much less liable to the convulsive attacks so common in newly weaned pigs, whose stomachs are unaccustomed to deal with the coarse food often too plentifully supplied them. Indigestion, constipation, and "fits" are very intimately connected, and all are due to improper feeding. The best way to teach young pigs to eat is to provide a run or "creep" into an adjoining pen, to which the sow cannot obtain access, or to feed them while she is turned out to get some exercise. Where separated milk is available a little thickened with sharps may be given in a small trough, and then solid food, in the shape of a few old peas or a handful of wheat, may be scattered for them to pick up, on which to exercise their jaws and train their stomachs.

Sterility of Twins.

Concerning the sterility of twins of opposite sex, records kept at Hohenheim, Germany, since 1885 show that during that period there were 2521 births in the herds, of which 116 were twins. Twins were more common with old than with young cows and could be traced to 44 out of 55 bulls used during the 25 years There were nine pairs of twins in the progeny of one bull which was used for two years. The progeny of the heifer twins could be traced in only 16 cases in half of which both twins were heifers. In three of these cases both heifers were fertile, while in the other five only one twin was bred, the other being weak and sent to the butcher. Of the 11 which were bred, none gave birth to twins, nor did their offspring up to the fourth generation. Of the other eight cases where the sexes were different, seven of the heifers were sterile, and one was fertile but bore a sterile heifer.

The Sheep Pays.

Money invested in sheep will nearly double itself in one year, since the fleece will pay for the feed and care of the sheep, and the lambs, often two per ewe, are the profit. It is estimated that ten sheep may be kept where one cow may, and the risk is much less. It may be said that the sheep always carries her pocketbook with her. If she dies, her pelt or fleece pays her funeral expenses. If she lives, her wool in the spring and her lambs in the fall pay double revenue. No other stock pays as large a percentage of clear profit on the money invested. Nothing else will build up a run-down farm as quickly as a flock of sheep. While pasturing, the sheep's manure is distributed about so evenly that no manure spreader could equal the sheep in its work. The American people are consuming more mutton every year, and a very bright future is in store for the sheep industry.—Professor R. J. Kuiser.

ter farrowing. The diet of the suckling sow should be gradually increased in richness and quantity, and as the pigs grow a little meal, composed of wheat, barley or oats, may be added to the sharps and bran, which is about the best diet at this period,

TRIED AND FOUND "NOT WANTING" IN ANY PARTICULAR

That's the verdict of hundreds of housekeepers who are using the

ENTERPRISE MONARCH STEEL RANGE.

Convincing evidence of this is found in the fact that the sales have doubled in a very short time and we have been compelled to greatly increase our manufacturing facilities to supply the demand.

There must be a reason for this, and to put it briefly, it is on account of the superior excellence of the MONARCH.

Call upon our nearest agent and examine the range and its many good points, when you will learn why it is selling so freely.

The MONARCH is for sale by leading dealers everywhere. Circular on application to

Why Every Breeder should Have a Typewriter.

After working hard all day in the stable, the field and in the woods, the average breeder goes home at night to find mail waiting him that demands prompt attention. Your hands are naturally calloused and you would rather handle a pitchfork than a pen. If you had a Typewriter you would find it much easier to manipulate. The key board, showing letters plainly, is very simple. It may take a little longer at first to write your letters, but you can "speed up" with little practice. Then again, a Typewriter is better in a home where there are growing children, especially girls, than a piano. If they learn to operate it will not take nearly so long for them to get through business college if they know the use of a Typewriter. Right here is where you will probably save the cost of a machine. They last a lifetime with care and the fact that your correspondence is written on a Typewriter will give give you a standing with prospective buyers that cannot be obtained in any other way. We have lots of new machines ready to ship and have several second hand ones that have been rebuilt. If you are interested write for further information with regard to cost, etc., mentioning The Maritime Farmer.

THE HORSE.

Treatment for Ringbone.

Ringbone is a hereditary unsoundness which is due primarily to steep shoulder, steep pasterns and bones of poor quality. The immediate cause is hard work at an early age, bad shoeing and bruises or other injuries to the pastern joint. Overgrown hoofs and poor shoeing also often cause ringbone.

Ringbone may often be preventdd by feeding the colts well, by trimming the hoofs frequently, by proper shoeing by a competent blacksmith and by avoiding hard work at an early age. The first step is to give complete rest for five or six weeks. Remove the shoes and see that the feet are pared level. If the pasterns are inflamed put on a bandage soaked with a lotion of half an ounce of acetate of lead in one quart of water. Renew this bandage for three or four days and then rub over the ringbone a blister made by mixing one teaspoonful of biniodide of mercury and four tablespoonfuls of lard. After this blister has been on for twenty-four hours wash it off and rub on a little lard. Repeat the blistering every other week until three blisters have been given. The animal should be given a complete rest of at least six weeks while this is going on.

If blistering does not cure the trouble, the next step is firing. The theory of this is that by means of touching the bone with a hot iron further bone enlargement is prevented. Firing is best done by a competent veterinarian. After everything else has failed, ringbone lameness may be cured by neurectomy, or cutting the nerves that lead to the foot. This cures the horse by completely destroying all sense of feeling in the foot, and consequently there is no further trace of lameness. The trouble is not removed, however, and in time the horse's feet are bound to go to pieces. To cut the nerves a competent veterinarian must be employed. Treatment for ringbone is at best unsatisfactory. Horses so affected should never be used for breeding purposes.

Feeding Work Horses

The horse's stomach is not large enough and cannot hold a feed of grain and hay at the same time; therefore, it is reasonable to suppose that the grain feeds will be more frequently digested and assimilated if not accompanied with too large an amount of hay.

The best results come from feeding work teams one peck of cut hay with their grain feed in the morning and at noon. By practicing this method the horses have a comparatively small amount of freshly-eaten hay to be digested while at work, and the grain feed being more nutritious and more easily digested than the hay, the horse is well nourished throughout the day.

The hay is principally digested in the intestines and the coarse fiber of it is mostly utilized by the large intestines, so there is but little gained by feeding hay during the day when the horses are being worked. At night feed the horses a liberal amount of hay, for this gives it an opportunity to work along in the intestines, where it is greatly reduced in bulk before active work the next day.

A hard-worked horse needs about all the nourishment he will take and should have all the grain that he will eat up clean and promptly. It is the grain that nourishes, but hay must give the necessary bulk to meet the requirements of the digestive organs. The horse that is constantly stuffed with hay must either eat less grain than he should or else suffer from overtaxed digestive organs, which make him slow and sluggish.

By feeding him liberal quantities of hay at night and a small amount of cut hay with his grain foods morning and noon he will keep in good condition and seldom be troubled with the colic and other serious derangements. —W. M. Phillips.

Making a Hoof Bath.

The water which is taken up by the hoof enters the lower border through minute openings and very little if any through the side of the wall. It is therefore unnecessary to have more than an inch of water in the tub. This practice is made easy by a great many who have constructed soak tubs of 1½ inch lumber, four inches deep, nearly as wide as the stall, lacking but two or three inches so that it may be easily turned up on edge and removed, and about four feet long if for the front feet alone. This can be placed in the rear of the stall for soaking the hind feet when necessary, but if one cares to make a tub as large as the stall it will be found difficult to make it water tight as well as portable.

It is better to have a permanent soak stall. The small tub described may be left in one stall and the animals moved to it, or changed daily from one stall to another, many users of it having it in place only during the noon hour. It will safely prevent tendency to contract and crack, as well as constitute a valuable part of the treatment of these conditions.—Dr. Leslie M. Hurt.

How to Trim Feet of Colts.

Close trimming is to be avoided at all times as tending to produce tenderness. When it seems necessary to trim close on one side in order to make the wall of nearly the same length at the quarter and heel, it is better to take off but a portion of the longer wall, then repeat the process in two or three weeks as often as may be necessary to level the foot properly.

Colts which are so deformed in their feet, especially their front feet as to suffer deviations in gait such as winging and paddling, may be greatly benefited by thie method of caring for their feet. The change may be brought about more rapidly by very careful shoeing in the hands of a skilful farrier, but this is seldom advisable except where the colt is handed daily.

Diagnosing by Pulse Beats.

To take the pulse of a horse stand on the left side, run the finger along the lower jaw until you come to a point where the artery crosses the jaw on its lower edge. The pulsations may be easily felt here. To get the pulse of a cow stand at the left side, reach over the neck and feel along the right jaw until the artery is found.

The normal pulse beat for the horse is 35 to 40 per minute. It may go as high as 100 in cases of disease. In the cow pulsations should count 45 to 50 per minute.

A soft pulse, one that is easily compressed by the finger, indicates bronchitis. A hard pulse, one not easily depressed by the finger, indicates acute inflam ation. A hard pulse is often quick, bounding and forceful. An irregular pulse, one that beats fast for a time, then slowly, indicates weakened heart condition. A slow pulse is one that comes up gradually to the finger touch, indicates some brain trouble.

Horsemen Attention !

DR. J. WOODBURY'S HORSE LINIMENT & DR. J. WOODBURY'S CONDITION POWDERS will save and preserve the life of your horses. Their use will cure and prevent the disease common to horses, such as, Cough, Colds, Distemper, Glanders, Spavins, Pink Eye, Splints, Curbs, Enlargements, Cracked Hoof, Kidney Trouble, Fevers, Cuts, Sores and will remove bunches of all kinds.

BEFORE USING.

CURES:

GLANDERS,
FOUNDER.

AFTER USING.

Use this preparation thoroughly for all and every disease of the horse for which it is recommended, Criticise it closely. Carefully watch, mark and note its effects, and honestly judging it on its merits, you will be compelled to endorse it.

TESTIMONIALS :

DEAR SIR :—I had a mare which had a very bad cough and heaves for almost six months, and became so thin there was nothing left apparently but skin and bones and I was tempted to shoot her. A friend of mine who had used Dr. J. Woodbury's Horse Liniment, with good success, induced me to try one bottle of it which I did with the best results. I used just one and one-half bottles of the Liniment which effected a complete cure of both the cough and the heaves, and I have worked and driven her ever since.

I strongly recommend Dr. J. Woodbury's Horse Liniment as the best Horse Liniment on the market, and advise all horse owners to try it. Very truly,

RODERICK McKENZIE.

DEAR SIR :—I have used Dr. J. Woodbury's Horse Liniment for a number of years, and have found it to be the most excellent article for the feet of horses kept in the stable. It prevents dryness and hardness, promotes a smooth and healthy growth and will, used according to directions, soon remedy anything like contraction of the hoof. W. A. C. RANDALL, M. D.

Hillsboro, N. S

MESSRS. FRASIER, THORNTON & CO., Cookshire, Que.

GENTLEMEN :—I have used your "Dr. J. Woodbury's Horse Liniment" for the past seven years for coughs, colds and lameness of all kinds, and find it gives the very best results for distemper. I certainly consider it the best on the market, and would never be without a bottle in my stable.

(Signed) WALTER SLATER, "Cash Livery."

FRASIER, THORNTON & CO., Cookshire, Que.

DEAR SIRS :—You may put my name on your list as one using your Horse Medicines. I have found them to be the best on the market, and am never without your Liniment and Condition Powders in my stable.

POULTRY.

The York and Sunbury Poultry and Pet Stock Association.

Editor Maritime Farmer:

On the evening of June 7th, a large and representative gathering of the citizens and poultrymen of York and Sunbury Counties met in the rooms of the Young Men's Liberal Conservative Club to consider the advisability of forming a Poultry Association.

On motion of J. N. Ferguson, A. D. Thomas was moved to take the chair, and John Bebbington acted as Secretary.

The chairman in his opening address emphasized the object of the meeting which was to create an interest amongst the people for raising and improving the poultry throughout the country. He said he had been speaking to a great many people, all of whom expressed themselves as having the same idea that the time had arrived when a poultry association would be an immense benefit to our counties.

J. N. Ferguson followed with a very interesting speech endorsing the previous speaker's remarks and showing the necessity for an association.

Fred Crowley, Frank Merrett, John Bebbington, Geo. Foster, Wm. Pitt James Roberts and others spoke along the lines of introducing superior breeds of poultry and encouraging their distribution amongst the people of the two counties by arousing a deeper interest in the commercial value of eggs and poultry by such means as the association may determine.

The following officers were elected:

A. D. Thomas, President; Fred Robinson, 1st Vice-Pres.; Fred Farrell, 2nd Vice-Pres.; Percy Gerow, Secretary and John Bebbington Treasurer.

Executive Committee—John Ferguson, Chairman; John Dougherty, Geo. Foster, Wm. Pitt, Fred Payne, Frank Merritt, James Roberts, Ivan Clewley, Fred Crowley, Wm. Chappell and Walter Lister.

The society is called The York and Sunbury Poultry and Pet Stock Association.

Moved, seconded and carried that the Executive get together and draw up a set of Bye-Laws for the Association.

About fifty enrolled themselves as members and we expect to have a membership of 200 inside of a month. —Percy Gerow, Secretary.

Editor's Note.—We are glad to note that the poultrymen of York and Sunbury Counties have clubbed together and we trust that ere long their influences will be felt in the better marketing of poultry produce.

Poultry Products.

W. E. Vaplon, Poultryman at the Colorado Agricultural College, in the weekly news notes sent out by the college has the following timely advice that should have a tendency to help draw our poultry raisers together and form local branches of the Canadian Poultry Breeders' Association:

"So long as we depend upon the grocer to handle our eggs, and upon the butcher to handle our fowls, so long as we take eggs to market that are large and small, mixed colors, white, brown, pink and speckled, so so long as we will bring in fresh egg with blood clots, and stale eggs taken from a stolen nest, clean and dirty just so long will we have to take the offered price in trade. So long as we remain a thousand miles from the consumer, whether in distance or in methods of marketing, so long will the several middlemen have the profits the producer should have.

"So long as we "don't care", and "what's the use," we are not going to create a greater demand for our products; so long as the consumer is satisfied with "any old egg," "an egg's an egg," so long will there be mutual indifference and distrust. It is a matter needing education, because of ignorance on both sides. We can create a demand only by educating the consumer's taste; feed him strictly fresh, sweet, tasty eggs for a while, and those who bring in the old products in the old way will find themselves out of a job.

"So soon as the consumer can eat his boiled eggs with his eyes closed, so soon will he fail to see the extra 5c. a dozen in the bill. So soon as the producer uses the Golden Rule trade mark on his egg package, so soon will the consumer draw his checks on the Golden Rule bank.

"Potatoes and apples from certain sections of our country have a reputation for quality; the only reputation our eggs have are for another kind of quality. So soon as we consider an egg of as much value as a potato, so soon we will get what it is worth on the market; as it is some get more and some get less.

"Most of the eggs we have seen sold at 12½c. this season were not worth more than ordinary fertilizer so much a load, or ton. It is time we got ashamed of ourselves and inspired a little confidence in the consumer by better and cleaner methods."

Treatment of Diarrhoea in Fowls.

The Veterinary Section of the Colorado Agricultural Experiment Station has been experimenting with different remedial agents with the view of finding some drugs that would, at last curatil the enormous loss among barnyard fowls from the various forms of diarrhoea.

Space will not permit the discussion of only one agent. The one that has thus far given us the best results is he Sulpho-carbolates compound, prepared by The Abbott Alkaloidal Co., f Chicago.

One flock consisted of sixty birds. Several were sick at the time treatment commenced and four had died. The discharge from the bowels was of a greenish-yellow color somewhat simulating fowl cholera. One thirty-grain tablet was dissolved in a quart of water and this fluid mixed with bran and corn chop. The mixture was then fed in clean troughs. In this way each bird got approximately one-half grain. This was repeated night and morning. No additional birds became sick, only two of those sick died, and the rest recovered.

Another flock consisted of 175 baby chicks. As soon as these birds were taken from the incubator, they were fed the unhatched eggs that had been cooked and chopped. This mixture was reported to possess an offensive odor. The birds began dying with symptoms of diarrhoea, white pasty vent, weak, dull droppy wings, etc. One-half the flock died before treatment was begun. One-half tablet was dissolved in warm water and the bread saturated with it. The birds immediately quit dying.

Still another flock consisted of 200 birds, including a few turkeys. Cholera had appeared on the premises the fall before. The outbreak was studied in the field and laboratory. The germ (B. Avicepticus) was isolated. In the last outbreak 14 birds had died and several were sick. Similar treatment was used as in the above flocks, except that powder was used instead of the compressed tablets. One tablespoon, rounding full, was dissolved in each two gallons of water. This water was kept constantly before them. No more birds were taken sick and no more birds died after the sixth day.

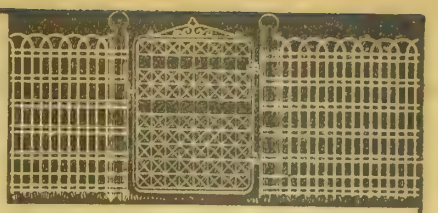
The above is a good illustration of three types of diarrhoea in which we have found this drug by far the best agent tried.

The poultry people will probably be able to secure this drug through their local veterinaraian or druggist. We have not investigated the commercial side of it.—B. F. Kaupp, Pathologist, Colorado Agricultural College, Fort Collins.

Dry Mash.

Probably the Maine Station dry mash mixture is as good as any, but we advise leaving out of it the linseed meal they recommend; we believe it is too rich a mash with that in. It is:—200 pounds good wheat bran, 100 pounds wheat middlings, 100 pounds corn meal, 100 pounds of beef scraps, 100 pounds gluten meal. They do not add the alfalfa or clover to the mash, although a good many do. In that case we would add 10 per cent. in bulk of clover or alfalfa. Of course, it should be mealed clover or alfalfa the cut clover or alfalfa is rather coarse to mix well with the meals.—American Poultry Advocate.

Handsome enough for the city lawn — Strong and cheap enough for the farm



Peerless Lawn Fence is made from heavy, No. 9 steel wire, all galvanized and coated with white enamel paint. It is built so strongly that it will last for years and it cannot rust. It costs less than one wooden fence and will outlive two. It will add to the appearance of any property. Let us send you the cost of fencing with

THE BANWELL HOXIE WIRE FENCE CO., Ltd., Dept. K, , Winnipeg, Man. Hamilton, Ont.

Poultry Notes.

A stunted chicken oftentimes furnishes the breeding place and is a distributing point for lice for an entire flock. Lice seem to gain a stronghold on the weak members first but if left alone the healthy fowls will succumb to their ravages.

An orchardist goes among his trees and trims out a branch here and there The trees grow better and yield more income by the fruit being larger and more choice. Just so had the culls ought to be thinned out of the flock of young chickens. The balance have a better chance of growing and will bring more money.

Molting is a natural process and it is a question whether or not it should be forced. There is a possibility of a forced molt weakening the constitution of a fowl to such an extent that nothing will be gained by such practice. A hen will commence to lay when her time comes, provided she is furnished the amount of grain, green food and animal food her system demands.

Some farmers still persist in building the old-time stair-step roosts, or four or five roosts, one above the other. It is only natural for a chicken to fly to the topmost one, and in this way the top roosts are overcrowded and the lower ones remain empty. The level roots with a droping board underneath are far superior.

tea is the result of care and experience in blending—must be the combination of fine flavor, smooth strength and richness. Because all these elements are so generously included in Red Rose Tea it well merits the term "good tea."

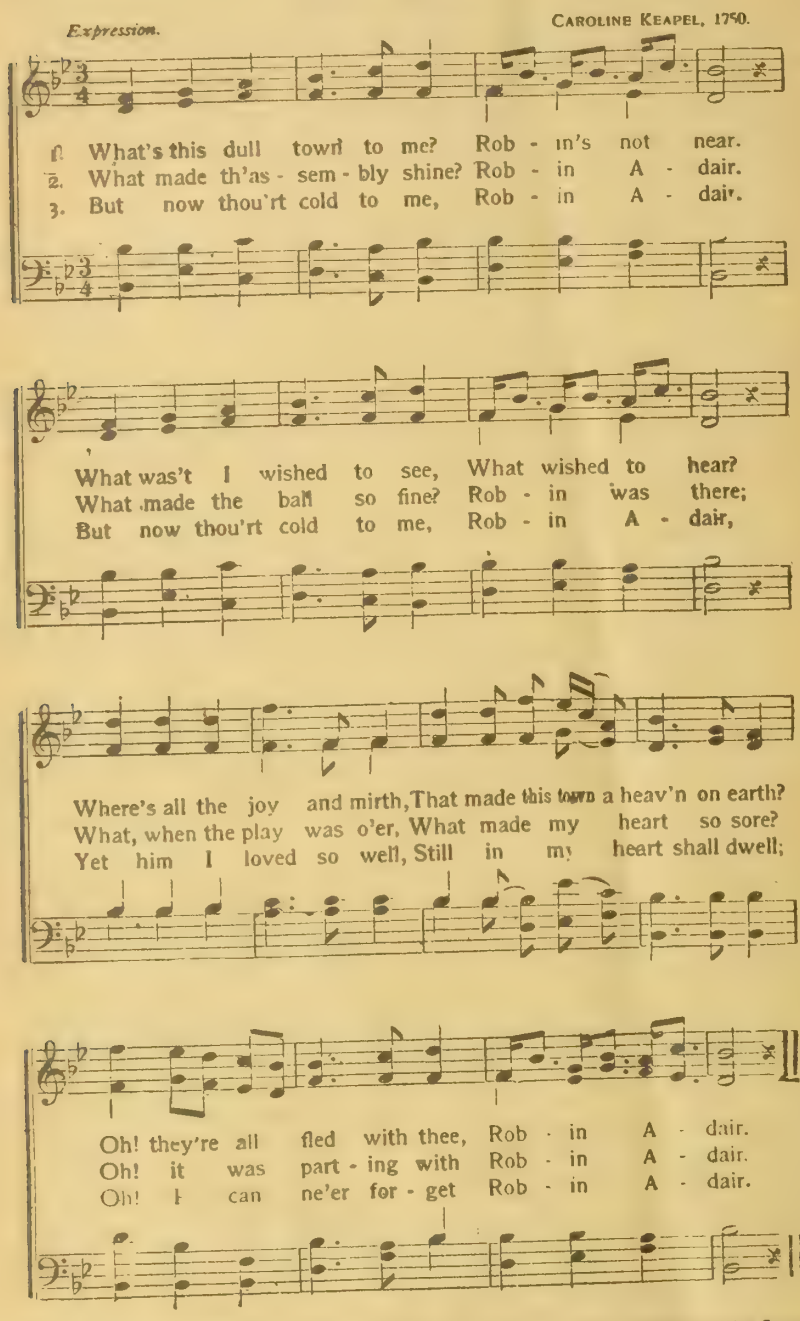
THE FARM HOME

This Department is now being edited by a very competent lady, who will be pleased to answer all inquiries. She solicits the aid of all who are interested in home making. This aid may be given in the form of short articles dealing with your experiences, questions or timely suggestions. Ladies, this department is yours. Use it to the best advantage.

Robin Adair.



Expression.
CAROLINE KEAPEL, 1750.
1. What's this dull town to me? Rob - in's not near.
2. What made th'as - sem - bly shine? Rob - in A - dair.
3. But now thou'rt cold to me, Rob - in A - dair.
What was't I wished to see, What wished to hear?
What made the ball so fine? Rob - in was there;
But now thou'rt cold to me, Rob - in A - dair,
Where's all the joy and mirth, That made this town a heav'n on earth?
What, when the play was o'er, What made my heart so sore?
Yet him I loved so well, Still in my heart shall dwell;
Oh! they're all fled with thee, Rob - in A - dair.
Oh! it was part - ing with Rob - in A - dair.
Oh! I can ne'er for - get Rob - in A - dair.

A book containing the words and music of twenty-six beautiful old-time melodies, will be sent to any address on receipt of 10 cents by Clark Bros., Moncton, N. B.

Love's Barrier

(Continued from last issue.)

CHAPTER IX.

A HIGHWAY OF HONOR.

A sudden change swept over the calm of Helen's face. It did not flush it became instinct with indescribable feeling; her eyes shone, her mouth became tremulous with sweetness. Her heart, quite cold to the man who thus proclaimed himself her lover, was yet touched by his chivalric devotion. For the story she had just told him was surely not one calculated to raise any woman in a man's estimation, though she had not told all.

"You are very good," she said in a low voice, full of intense feeling. "I can never thank you; but it is impossible."

"Why is it impossible?"

He spoke with the quick impatience of the man who will not recognize an obstacle.

"Oh, do you not see? We have known one another only for five days, and ——"

"Time is of no importance in such a matter," he interrupted feverishly. "I knew the first moment I saw you that I felt for you what I have never felt for any woman before. I did not try to analyze it, only I know the world was a different place for me during those scanty hours we spent together, and that since they have been over my life has seemed grey, purposeless, altogether impossible. Surely that can have but one meaning."

"From your point of view perhaps" she said gravely. "But you forget what you propose has two sides. Marriage surely requires that two shall be agreed. Even the most unfortunate of them start, we must presume, on that assumption."

"The circumstances are unusual," he reminded her. "I am honored beyond all telling by your confidence. It gives me hope that in the future everything would be easy. I think I could make you happy, and even perhaps I might teach you to care."

She shook her head, and her eyes filled with sudden tears.

She looked at him with a straight, direct, simple look.

"Believe me, I shall never forget your chivalrous generosity, never forget that you offered to a friendless and beaten woman the best you had to offer. I am very unhappy, and I do not know which way to turn, but I would not seek the most selfish way out. I would not spoil your life."

"Spoil it! You would be the making of me, and of any man's life," he interrupted once more, with the same strange passion. "You speak of selfishness. It is all on my side. I press for that which I want beyond anything on earth, and I am kept humble by the poverty of the thing I offer. I have told you that I am a poor man. My income is only three hundred a year, and there is my sister."

"And yourself. Don't forget to mention yourself, when you speak of your poverty," she said, with a swift bewildering smile. "If I know anything of country parishes, and the place of the priest there you could wed where you liked. You do not need to go afield to seek a wife, even one who would do you so little credit as I."

The words were delicately said and conveyed a very subtle form of flattery, but Secretan would have none of them. For the first time in his life he was really humbled. A great love, such as his had undoubtedly become, glories in debasing itself.

"Why will you belittle yourself? You must know how fitted you are to grace any station. And I am something less than a poor man. I am the son of very poor parents, I could never be your equal in any sense."

"Hush!" she said sharply. "You are a good man, and as such are immeasurably the superior of a woman like me. I have tried to tell you something of my life, but I see now that you have not grasped any of its mean sordidness, its ghastly makeshifts, its hollowness and pretence. It has all been very bitter, but it has done more harm even than I thought. It has created a gulf between my life and a life like yours. Believe me, I am right when I say nothing could bridge it."

"I believe nothing of the sort," he said with a quick impatience which caused a slight smile to touch her grave lips. "I believe that you are the wife for me. I want you. I will have you. I'll teach you to care for me, and to forget all the misery you speak of."

His masterful way pleased her. Few women care to be humbly wooed, and the masterful lover succeeds where the suppliant fails. For a moment Helen was silent, greatly tempted. It offered a way out—no humiliating, doubtful way, but a highway of honor, the offer of a good man's shelter and name and love. Accept this, and she righted herself instantly with the sneering, prying world that had played with her good name; she could rid herself at once and for ever of the daily companionship of her stepmother, and score a veritable triumph over her. This temptation was great, but as she glanced at Secretan, admiring the man, she admitted to herself that it would not be fair. For though she had found him a pleasant and interesting acquaintance, she had no love for him; she told herself that her heart was a dead thing which no power on earth could revivify. No, she would not do him so great a wrong. She rose to her feet a little heavily.

"Thank you very much," she said very quietly; "but it is impossible. We had better say good-bye. I shall always remember that you were willing to give a friendless woman the best you had to give. If I appreciated it less, I would accept, but—but you must understand."

He took her hands, and his deep eyes, glowing with the passion of his heart, clave to her changing face.

"Helen!" he cried hoarsely. "I am not asking much. You say you don't care for me, but I am willing to wait. I will not be impatient dear. Like Jacob, I can serve seven years for you. Don't send me away! Give me the right to take care of you, to give you a home."

She suffered her hands to remain, and her eyes met his in large, questioning appeal. He was so big, so strong, so kind and good; so different in every way from most of the men she had seen, whose first and last thought had been for self alone. When she compared his chivalry to the cold selfishness of the man who had sworn he loved her, and to whom she had given the first fruits of her girlish passion, she shuddered. Yet Secretan was no weakling. She secretly gloried in his splendid looks. Beside him, Hunt in all his glory would not have had the best of it.

"You are rushing to your own destruction," she said, with her fleeting smile of pathos. "Don't you see the great barrier is that I don't care? I like you, I respect you—but I don't care, and I shall never care for you,

THAT AWFUL BACKACHE

Cured by Lydia E. Pinkham's Vegetable Compound

Morton's Gap, Kentucky.—"I suffered two years with female disorders, my health was very bad and I had a continual backache which was simply awful. I could not stand on my feet long enough to cook a meal's victuals without my back nearly killing me, and I would have such dragging sensations I could hardly bear it. I had soreness in each side, could not stand tight clothing, and was irregular. I was completely run down. On advice I took Lydia E. Pinkham's Vegetable Compound and Liver Pills and am enjoying good health. It is now more than two years and I have not had an ache or pain since I do all my own work, washing and everything, and never have the backache any more. I think your medicine is grand and I praise it to all my neighbors. If you think my testimony will help others you may publish it."—Mrs. OLLIE WOODALL, Morton's Gap, Kentucky.

Backache is a symptom of organic weakness or derangement. If you have backache don't neglect it. To get permanent relief you must reach the root of the trouble. Nothing we know of will do this so surely as Lydia E. Pinkham's Compound.

Write to Mrs. Pinkham, at Lynn, Mass., for special advice. Your letter will be absolutely confidential, and the advice free.

Caught a Cold

Which Ended in a Severe Attack of Pneumonia.

Too much stress cannot be laid on the fact that when a person catches cold it must be attended to immediately, or serious results are liable to follow.

Bronchitis, Pneumonia and Consumption are all caused by neglecting to cure the simple cold.

Mrs. G. W. Bowman, Pattullo, Ont., writes:—"Three years ago I caught a cold which ended in a severe attack of Pneumonia. Since that time at the beginning of each winter I seem to catch cold very easily. I have been so hoarse I was unable to speak loud enough to be heard across the room. Last winter, however, a friend advised me to try Dr. Wood's Norway Pine Syrup, saying it had helped her. I bought a bottle and before it was half used I was completely cured. I also find it a good medicine for the children when they have colds."

Beware of the many imitations of Dr. Wood's Norway Pine Syrup.

Ask for "Dr. Wood's" and insist on getting what you ask for.

It is put up in a yellow wrapper; three pine trees the trade mark; the price, 25 cents. Manufactured only by The T. Milburn Co., Limited, Toronto, Ont.

"More bread & better bread"

PURITY FLOUR

Lame shoulder is almost invariably caused by rheumatism of the muscles and yields quickly to the free application of Chamberlain's Liniment. This liniment is not only prompt and effectual, but in no way disagreeable to use. Sold by all dealers.

as you say you care for me. It is too great a risk. Tell me—in your experience of the cure of souls have you never come in touch with the tragedy of a loveless marriage?"

"If I have, it has nothing to do with us. I am not afraid. I have enough love for two. Let me try, Helen. I swear I can't go back to the old grey life after a glimpse of paradise has been vouchsafed. Let us be married, and soon. I believe that together we should conquer fate."

She drew herself a little away, and finally, turning completely from him, walked down the path by the river's brim. He did not seek to follow her, understanding that she sought counsel with herself, which augured hopefully for his cause. Somewhere across his mental vision flitted the words "She who hesitates is lost," and a smile followed them.

He admired the straight, lissome outline of her fine figure, the air of breeding, the neat, proud poise of the small head. How commonplace how ordinary, how altogether different in comparison were all the women he had ever known.

When she came to him again, walking slowly, yet without hesitation, he felt his heart beat almost to suffocation.

Her expression had changed; her face, a little white, was set in sudden determination.

"It is not out of pity you ask me" she said, and there was a difficult note in her voice. "You—you care enough, you say, for both! Are you quite sure of all that it involves?"

"It involves all I care for, the right to shelter you!" he answered quickly.

"And you will not expect too much? I cannot pretend a love I do not feel, but I would not fail in my duty to you. You are willing to take all these risks, and—and any others that might arise?" she added, her glance swerving for a moment from his face.

"I take all the risks gladly. I am not afraid."

"But you know so little of me! I may be a quite impossible person to live with, and my stepmother the sufferer. You have nothing but my word."

"You forget I don't see you today for the first time. There were five days in Paris, in all about ten hours' intimate talk. Surely that must count for something."

"Ten hours to prepare for a lifetime! You have a large trust. I will take you at your word. I will marry you, understanding that you accept all the risks."

She gave him her hand, and he took it between both of his. She was very thankful that he did not offer to kiss her. Afterwards he remembered that it had not occurred to him to do it, though it is usually by a kiss that such a compact is sealed.

"Thank God! God bless you, and may He judge between me and thee," he said in a very full voice. She drew herself a little away, and released her hands.

"Where shall we go now? What shall we do?" she asked feverishly as if she feared to continue the theme. "I feel that I am very inhospitable, but you understand that the house is not mine. I have not even the right to ask who I will to it."

"I quite understand," he answered gently. "But you are going to take me there now. We can perhaps take a roundabout way, so as to bring us there as near the appointed time as possible."

She stood still, looking at him wonderingly.

"You mean it? You will go there, face Mrs. Revell, perhaps tell her what has happened?"

"That is precisely what I am going to do," he answered steadily. "You belong to me now, and the quicker she understands it the better."

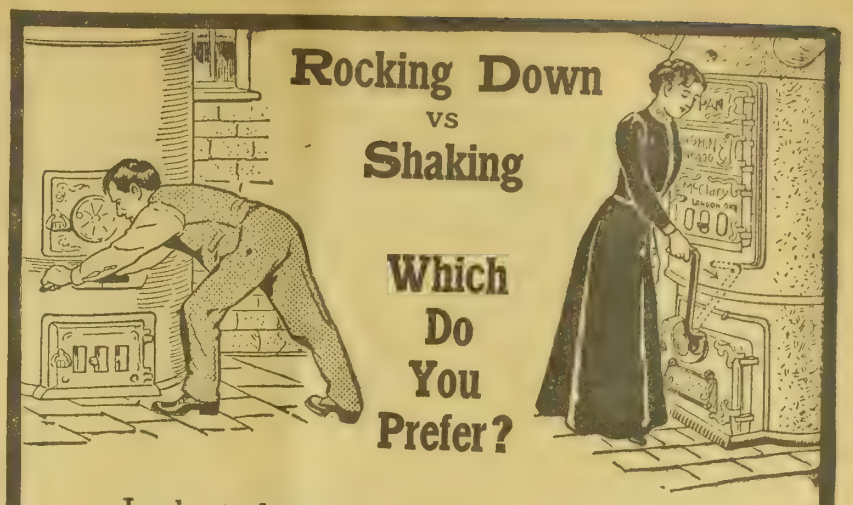
"It will not be pleasant for you, and it is not even necessary," she said reluctantly. "She has really no right to be consulted, or to know what is going on. Even if I marry, I should not take her into my confidence."

"I will not leave Colchester without seeing her, and placing the matter on the right foundation," he said quite quietly, but with an equal decision.

"But she has never even heard your name," said Helen in dismay. "The children have told her about the nice man who was always so willing and so clever in helping with the boats, but they don't even know his name. It would have to be explained from the very beginning."

"Well, I think I am equal to that. Don't you think I look it?"

The change that had come over him astonished her, and filled her with a strange mingling of admiration and a little dismay. Now he was the lover triumphant, ready to stand up to the whole world if need be, proud only when she was by his side. If only she had cared, what pride would have been in her heart. How it would have swelled with the joy of living and the ecstasy of love!



Look at the man above. He's SHAKING an ordinary furnace. He bends nearly double, exerts all his strength, works up a prespiration, and gets a sore back.

Now, look at the woman. She stands nearly erect, gently moves the lever to and fro, a few inches, and the ashes are dropped into the Sunshine ash-pan. This is called ROCKING DOWN. It's so easy a child can do it.

Which method do you prefer? Why, Rocking Down, of course.

51

Go to our agent in your locality. Let him show you the many other time-saving, labor-saving and fuel-economizing features of the Sunshine. Order him to install the Sunshine with a *guarantee* to heat your home to your entire satisfaction.

Here's the Fence That is all Steel—

Steel wires, steel locks, steel posts. Standard Woven Wire Fence is all No. 9 hard steel wire, well galvanized. "The Tie That Binds" is hard, smooth steel that holds uprights and running wires absolutely secure without injury. Standard Patent Posts are 12 gauge steel, bent at right angles, and so constructed that wires are held without staples.

Let us tell you a lot of other things about the Standard Wire Fence and our Metal Gates of Galvanized Tubing. Our books are full of fence facts. Write for free copies and sample lock.

THE STANDARD WIRE FENCE CO. OF WOODSTOCK, LIMITED, Woodstock, Ont. and Brandon, Man. 18

"I don't think I realized until this moment just how big you are!" she said with an odd little laugh. "You are quite determined then, to see Mrs. Revell?"

"Quite, unless you absolutely forbid it."

"Oh, I don't do that. The situation is a little odd—that is all. Couldn't you sleep in the town to-night, and let me explain first to her, before you have the interview? It would certainly be easier for you."

"But I'm not seeking the easiest way. I want to spare you, to make the way as smooth as it can be made for, after all, you have still a few weeks to live under her roof, but I shall take care that it will be a very few weeks."

"You are very masterful. Do you know that I have been accustomed to order my life pretty much as I pleased? I have never obeyed anybody. Why should I obey you?"

"You will not find me a hard task-master, dearest. In everything except what pertains to your welfare, you will find me as wax in your hands. But I reserve the right to take care of you in the way that seems best in my sight."

"But I might differ."

"Then we should laugh all the differences away. I'm right in this. If Mrs. Revell is the sort of woman I imagine her to be, she will respect me all the more for taking a bold stand. It will thus be better for you."

"Whatever your imaginings may have been I am quite sure you have never conjured her up as she actually exists," said Helen, with a faint smile. "I can't tell you how queer I feel, almost as if I had been suddenly called to take part in some comedy for which I had not learned my book."

"I will take the book," said Secretan calmly. "And I think I'm going to enjoy myself very much. How long will it take us to get back to the house?"

"About ten minutes."

"Then let us stop here and talk for another half hour."

He drew her hand within his arm, and they turned down the path together. Helen felt herself like an unreal person, until suddenly he took her breath away by his next words.

"This is the thirteenth of November. In four weeks from today we can be married and we shall go back to Paris for a bi honeymoon."

She laughed out loud.

"It won't happen. It can't possibly happen! You and I to marry! I take back my words. I won't do it.

"Take them back! Not if I know it; they were too precious, and I'm not going to be tossed back to despair when I've once been on the heights," he observed with the singular calmness of appropriation which secretly amazed and even fascinated her. Helen Revell had a strong personality, which much isolation and introspection had undoubtedly fostered. But now she met one which matched her own; nay, bade fair to overshadow hers.

"You talk as if matrimony was as common as taking a meal. In the place where you live do people accept the deluge like this?"

"They haven't had a chance," he answered grimly. "But why should we wait? The situation is acute. The home is ready, and the sooner you bless it with your presence, the happier its possessor will be."

"But what about the other presence, the sister of whom you told me in Paris?" She cast a quick eye upon his face, but Secretan betrayed no apprehension.

"My sister will rejoice in my happiness. She has often said she wished I would marry."

"That is well in theory. Good sisters invariably speak like that when they imagine themselves secure. But we have to come to details. What will become of her? She will remain where she is, of course."

"Oh, no; that would be impossible and unfair to you!"

"But I should not mind; in fact, she would save the situation. Don't you see how awkward it would be for us to be quite alone at first? We should be dreadfully afraid of one another, and if she is as good as you say it would be much happier to have her."

$3,600 in Cash Prizes for Farmers

WHEN you enter the Canada Cement Prize Contest, your dealer will assist you. Consult him in reference to conditions of the contest. Refer all questions of doubt to him to decide. Confer with him when his experience and advice and his knowledge of our plan would seem helpful.

Don't hesitate about doing this. We have requested him to assist to the best of his ability any farmer in his locality competing in this contest—whether it's a matter involving the application of cement, or how to go about winning one of the prizes offered in this contest. Do you realize that you have as good a chance as the next man to win one of these prizes? There are four for each Province, as follows:

PRIZE "A"—$100.00 to be given to the farmer in each Province who will use during 1911, the greatest number of bags of "CANADA" Cement. PRIZE "B"—$100.00 to be given to the farmer in each Province who in 1911 uses "CANADA" Cement on his farm for the greatest number of purposes. PRIZE "C"—$100.00 to be given to the farmer in each Province who furnishes us with photograph showing the best of any particular kind of work done on his farm during 1911 with "CANADA" Cement. PRIZE "D"—$100.00 to be given to the farmer in each Province who submits the best and most complete description of how any particular piece of work shown by accompanying photograph, was done.

Contest will close on November 15th, 1911, and as soon as possible thereafter, prizes will be awarded.

Be sure and get a copy of our Contest Circular, telling all about the contest. Ask your dealer for one or use the attached coupon, if you find it more convenient.

In writing us, mention whether you have received your copy of "What the Farmer Can Do With Concrete," a profusely-illustrated 160-page book, which tells you how to build with concrete, so that you can do much of the work yourself. It's a mighty handy and useful book, and should save you many a dollar. Farmers who have received it, say it is splendid. Write to-night and it will go back to you with Prize Contest Folder, by return mail.

Please send Circular and Book.

Do A Bigger Day's Work With Champion Side Delivery Rake and Champion Hay Loader

Sulky rakes are all right as far as they go, but you can do a far bigger day's work in the hay field by using the "Champion" Side Delivery Rake and the "Champion" Hay Loader. The Side Delivery Rake shakes up the hay so it will be in best condition for curing and leaves it in a continuous windrow ready for the "Champion" Hay Loader. This machine then follows along and loads the hay just as fast as you please—two tons in ten minutes. Just let us send you catalogue B 41 so you can see for yourself how much you require these machines.

Secretan smiled a superior smile.

"You show me every moment how different you are from all other women. I cannot imagine you possessed with the unreasoning jealousy of some other women. You are cast in a very different mould."

"It is an inferior one," she said promptly, and a little silence fell upon them. She marvelled at the blindness of the man, who could not see that in pleading for the presence of another in the house she was seeking to build for herself a house of defence. It is only the woman who loves who wants the loved one to herself, who is jealous even of the ties of blood. Secretan saw nothing of this. His assumption of knowledge and experience was nothing short of colossal.

"Are you still of the mind to face Mrs. Revell? You can repent, if you like, and take me to a tea shop instead," she said after a moment.

"I should love that beyond everything, but we must take Mrs. Revell first. When we get her off our minds, and she has driven us forth—shall we say without any refreshments?—then we can descend upon the tea-shop?"

Helen laughed again; the pure comedy of the thing amused her mightily.

"Come," she said, slipping her hand from his arm; "and your blood be on your own head."

(Continued next issue.)

Farmhouse Food.

Curried Veal.—Cut some cold roast veal into pieces about an inch square slice four onions and two apples, fry the onions in 2 oz. of butter, take them out, fry a tablespoonful of curry powder and a tablespoonful of flour in the butter, put back the onions, and add the apples and half a pint of broth or water; when nicely boiled, put in the meat, let it get quite hot; add a good squeeze of lemon juice before serving. Place a border of boiled rice on the dish, make a well in the centre, and put the curry into it. The rice may be garnished with pickles. Indian chutney should be handed with this dish.

Scalloped Mutton.—Cut cold cooked mutton into small pieces. Put a layer of bread crumbs at the bottom of a shallow backing dish, then the mutton, and over that a sauce made in the following manner:—One tablespoonful of butter or milk, one tablespoonful of flour, one cupful of liquid (that in which mutton was cooked, if you have it). Season to taste with salt, pepper, chopped parsley or an onion. Brown the fat and flour together: add slowly the liquid, and cook five minutes: season. Bake 28 or 30 minutes in a hot oven. Cold beef or veal may be used in place of mutton.

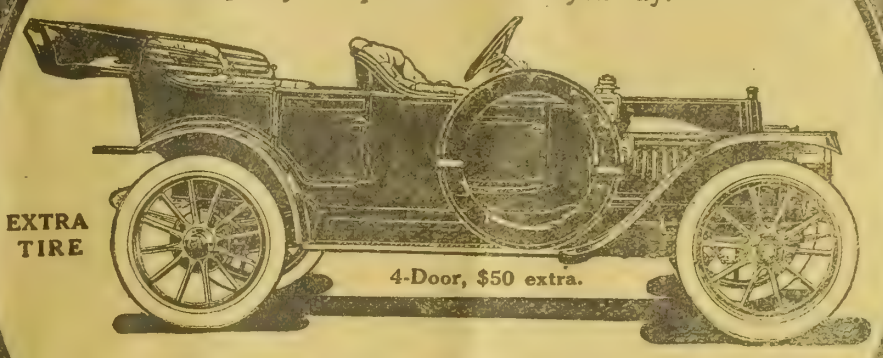
Carrots a l'Indienne.—Braise some young carrots, and let them get cold. Prepare a rich curry sauce, and have ready two or three hard boiled eggs, which have been allowed to get cold and then sliced: slice the cold carrots and lay them with the sliced egg in the curry sauce, and allow them to heat gradually in the sauce: then make a well of nicely-boiled rice in a dish, garnish with strips of red and green chillies, and fill up the centre with the carrot and curry mixture.

Vegetable Soup.—Put three pints of water into a saucepan, and bring it to the boil. Well clean two heads of celery, six onions, three carrots, three turnips, and two parsnips, if liked. Cut all these vegetables into inch lengths, and put them into the boiling water. A bacon bone is an improvement. Let this boil for twenty-five minutes, then put in a teacupful and a half of rice; let this boil another fifteen minutes, pour in a hot dish, sprinkle a tablespoonful of finely chopped parsley over, and serve.

Lemon Buns.—Put 1 lb. of flour into a basin, and with the hands rub in 6 ozs. of butter and a heaped dessertspoonful of baking powder. When these are well mixed in, make a well in the flour and break in two whole eggs, the grated rind and juice of two lemons; pour in a little buttermilk or sour milk, making the flour into a nice dough that will not stick to your fingers. Turn it on a floured board, cut in pieces, making about twelve or fourteen buns of the dough. Roll into a ball with lightly-floured hands, press them into shape, and bake in a hot oven half an hour.

Your "Everitt" Safeguards

"Everitt" claims are practicability, and dependability—service, at minimized tire and gasoline cost. "Everitt" safeguards are bound up in unique, yet simple design, accuracy and accessibility of parts and—notably—the Tudhope policy of "protection after you buy."



A TWO Years' Guarantee and "Special Tudhope Equipment," including Extra Tire, go with the "Everitt." Its Canadian price saves you $450 duty. No better car expenditure of $1,450 is possible than for the "Everitt"—complete in every detail—designed for hard service on Canadian roads.

Two Years' Guarantee and "Special Tudhope Equipment," including Extra Tire, go with each "EVERITT."

The "EVERITT" is built, not assembled, car bodies and all, under one roof. We Know everything is Right.

The Car with Car Troubles Sifted Out. Performance is the Proof of "Everitt" Perfection.

We are waiting to Demonstrate.

Hymeneal Laws and Time-honered Predictions.

Love alters not with the passing centuries, nor has its lengthy creed lost materially of the ceremonial tenets of an older day. There is that old warning couplet:

Change the name and not the letter,
Change for worse and not for better.

Miss Brown may ignore it to become Mrs. Bevers, and Miss White may laugh at it while telling her intimates that she is to be Mrs. Wells; but do not both of them in that very laughing, doubting apology thereby prove this all but immortal folk-lore of marriage, even though, as daughters of the newest of the centuries, they decline wholly to be bound by it? To be sure, an elder and unmarried sister no longer feels it incumbent upon her to dance barefoot at the younger maiden's bridal so to ward off the hideous threat of spinsterhood, nor has that venerable prophecy its one time weight—about, "Thrice a bridesmaid, never a bride" but, for the rest, hymenal superstitions are practically as abundant and as revered as ever they were.

For the days of engaged impatience and blissful plans to be well-observed dictates of Dan Cupid are alllbut endless. First must be considered the month. To begin with, Lent is barred; for "Married in Lent, you'll live to repent," and the average girl will decide such a question without hesitation even at the cost of waiting forty days longer. May, too, is held unlucky.

Perhaps this belief goes back to Ovid's time, for the Latin poet laid a ban upon the month as that in which fell the celebration in honor of the great dead. For no other reason than that in it Mary Queen of Scotts began her own much-married and none too fortunate career. The truth though its origin is obscure, comes down to this, that those four weeks of lavishly beautiful stage settings are yet looked upon askance.

Not one of the months but has its own predictions. Thus runs the best known of the formulae:

Married in January's hoar and time widowed you'll be before your time.

Married in February sleety weather, life you'll tread in tune together.

Married when March winds shrill, and roar, your home will lie on a foreign shore.

Married 'neath April's changeful skies, a checkered path before you lies

Married when bees o'er May blooms flit, stranger around your board will sit.

Married in queen rose month of June life will be one long honeymoon.

Married in July's flower banks blaze bitter-sweet memories in after days.

Married in August's heat and drowse lover and friend in your chosen spouse.

Married in Gold September's glow, smooth and serene your life will flow.

Married when leaves in October thin toil and hardship for you begin.

Married in veils of November mist fortune your wedding ring has kissed.

Married in days of December cheer, Love's star shines brighter from year to year.

I may seem amusingly evident from this that the seers at Cupid's shrine have tried to say nice things of pretty nearly all the units that go to build up the year (playing safe would be the terms used by their craft by the betting fraternity.)

Every single day of preparation has its own time honored instructions for the happy little woman, in the case.

If she is wise, she will add to her inward rejoicings, as well as satisfy the Fates, by doing herself a good part of the work upon her trousseau. And by all means she should help mix the bridal cake; she may not spoil it, and she certainly will advance her chances for that joy af life, which of course, she deserves.

Everyone knows it is bad luck to put on the entire wedding outfit before the final dressing for the ceremony itself, and almost every bride knows the color of her gown for that most momentous of all moments is a matter not to be settled merely by what is becoming. what is written in the hymeneal law and prophets?

Married in grey, you will go far away;

Married in black, you will wish yourself back;

Married in brown, you will live out of town;

Married in red, you will wish yourself dead;

Married in pearl, you will live in a whirl;

Married in green, ashamed to be seen;

Married in yellow, ashamed of your fellow;

$15.95 AND UPWARD

THIS OFFER IS NO CATCH

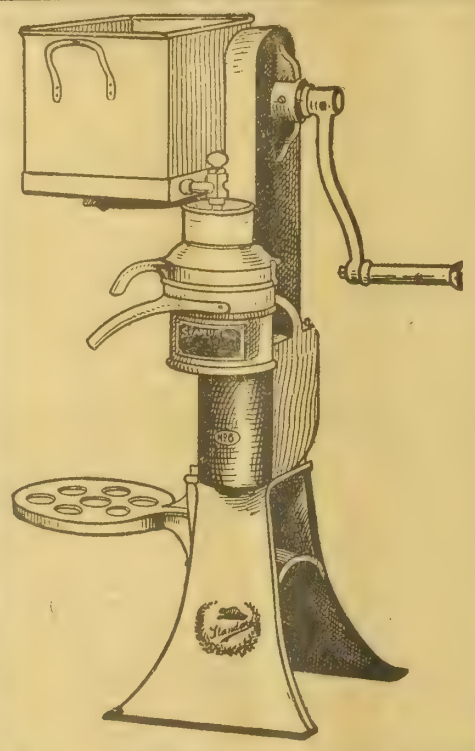
It is a solid, fair and square proposition to furnish a brand new, well made and well finished cream separator complete, subject to a **long trial** and **fully guaranteed,** for $15.95. Different from this picture which illustrates our large capacity machines. Skims **1 quart of milk a minute,** hot or cold; makes thick or thin cream and does it just as well as any higher priced machine. Any boy or girl can run it sitting down. The crank is only 5 inches long. Just think of that! The bowl is a sanitary marvel, **easily cleaned,** and embodies all our latest improvements. Gears run in anti-friction bearings and thoroughly protected. Before you decide on a cream separator of any capacity whatever, obtain our $15.95 proposition.

THE LOW DOWN AMERICAN SEPARATOR

EXCELS ANY SEPARATOR IN THE WORLD

OUR LIBERAL TRIAL ENABLES YOU TO DEMONSTRATE THIS. While our prices for all capacities are astonishingly low, the quality is high. Our machines are up to date, well built and handsomely finished; run easier, skim closer, have a simpler bowl with fewer parts than any other cream separator. Thousands of machines in use giving splendid satisfaction. **Write for our 1911 catalog.** We will send it free, postpaid. It is richly illustrated, shows the machines in detail and tells all about the **American Separator.** Our surprisingly **liberal long time trial** proposition, **generous terms of purchase** and the low prices quoted will astonish you. We are the oldest exclusive manufacturers of hand separators in America and cannot afford to sell an article that is not absolutely first class. You save money by dealing with us and at the same time obtain the finest and highest quality machine on the market. Our own (manufacturer's) twenty-year guarantee protects you on every **American Separator.** We ship immediately. **Cream separators are admitted into Canada free of duty.** Write us and get our great offer and handsome free catalog. ADDRESS,

AMERICAN SEPARATOR CO., BOX 1212, BAINBRIDGE, N. Y.



"THE STANDARD"

IS THE WORLD'S GREATEST SEPARATOR

The **"Standard"** is the nearest approach to Cream Separator perfection ever accomplished, not only in skimming but in every way. It is constructed on approved mechanical principles and materials of the highest standard only are used. Its cost is very little higher than ordinary machines and its productivenes is 25% to 40% greater than the old method of skimming and 10% to 25% over all other separators.

A WINDSOR LADY'S APPEAL.

To All Women: I will send free with full instructions, my home treatment which positively cures Leucorrhoea, Ulceration, Displacements, Falling of the Womb, Painful or Irregular Periods, Uterine and Ovarian Tumors or Growths, also Hot Flushes, Nervousness, Melancholy, Pains in the Head, Back or Bowels, Kidney and Bladder Troubles, where caused by weakness peculiar to our sex. You can continue treatment at home at a cost of only about 12 cents a week. My book, "Woman's Own Medical Adviser," also sent free on request. Write to-day. Address Mrs. M. Summer, Box H, 309, Windsor, Ont.

Agents Wanted!

We want farmer agents in all parts of the Maritime Provinces to sell the Acme Steel Ladder.

It is one of the best propositions ever offered to a farmer who wants to make money during his spare moments.

Write to-day for particulars as to territory, etc

The Acme Seel Ladder Co.,
Sussex, N. B.

Married in blue, he will always be true;
Married in pink, your spirits will sink,
Married in white, you have chosen aright;
Then arises the question of the day of the week where the jingle is perhaps widest known of all:
Monday for health.
Tuesday for wealth.
Wednesday the best of all,
Thursday for losses,
Friday for crosses,
Saturday no luck at all.

So comes at last the day—and it is safe predicting that at least the she of the "high contracting parties," will, first thing of all, fly to the window for a look at the weather, for "Happy the bride the sun shines on."

And when she begins to don those pretty things that represent busy labors of happy hours, what then!

Well, she will put on her right shoe before her left; that points to success in life:

She will use no pins; they betoken spite.

She will take good care that the Only man-in-the-world doesn't see her until she comes at last to be joined to him for life; for there is a saying about the ill luck of that, too.

Mr. Bridegroom, of whom scant notice is taken by the originators of all this mass of sage advice, here comes in for a single warning: He is not to stand at the junction of a cross-roads or beside a barred gate on his wedding morn. If he does, look out!

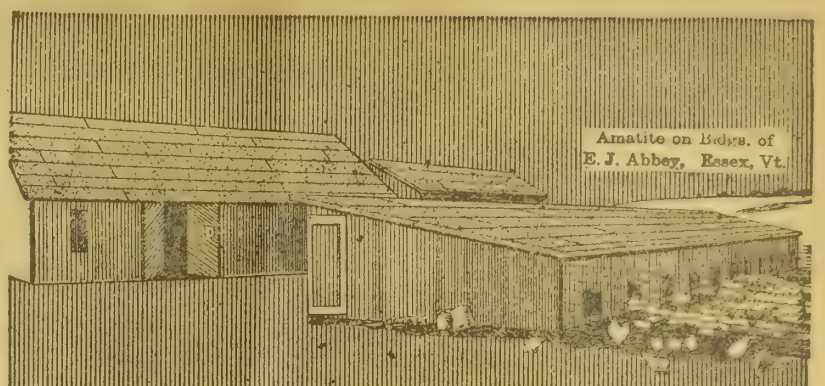
Of the march to the church there is much to say. The fairies of ill omen announce that no funeral must be met on the way, and they foretell dire results if the steeple clock should perchance strike while the ceremony is going on. The fairies of promise declare that the attending maid who catches the bride's bouquet, thrown among the guests when Miss had become Mrs., will be first married, and that she who gets the ring, deep buried in the great cake, will join for life the man of her heart's own choice before the year is out.

Furnishing a Bedroom

In furnishing a bedroom where there is limited space, it is well to have as many things as possible which will hang up," says Christine Terhune Herrick in Woman's Home Companion. "The shot bag which hangs on the inside of the closet door should have pockets deep enough to accommodate shoe holding trees. Provide a bag of some suitable wash material for soiled handkerchiefs and collars and hang this where it will be accessible.

Cleanliness in a bedroom cannot be too strict. Dusting with a damp cloth should be an every-day affair. If the walls are painted, they should be wiped off every few weeks with a cloth wrung out in suds to which a little kerosene has been added. When there is a washstand the furnishings of this should have daily care. The inside of the bowl, pitcher and slop jar should be washed with hot water and soap and the last named article should be scalded out daily The soap dish should be washed thoroughly every day.

Special attention should be given it should be entirely stripped and well aired, the covers turned down over the foot on a chair placed there to keep them from contact with the floor the mattresses tilted up that air may get to both sides. The mattress must be turned daily. When the bed is made the mattress cover should be laid on smoothly, the lower sheet tucked down all around before the upper sheet goes on. The latter must far enough to insure against working up at night and yet sufficient must be put under the mattress at the foot be left free at the top to protect the



Amatite ROOFING
Needs No Painting
TRADE B MARK

AMATITE *roofing is weaned.* It doesn't need to be watched over and fussed with and cared for.

It takes care of itself from the start. As soon as it is laid on your roof, you can go away and forget about it.

You *don't have to paint* Amatite every two years as you do the "rubber" kinds. Amatite has a mineral surface which needs no painting.

The mineral surface is better and more durable than many coats of paint.

Back of the mineral surface is a layer of pitch, the greatest waterproofing compound known. Back of the pitch is a layer of felt (a whole ready roofing in itself), and behind this is another layer of pitch and another layer of felt. The result is a strong, durable roof which can take care of itself in any climate without painting.

We will be glad to send you free a sample of Amatite Roofing so that you can see for yourself just what it looks like. Address our nearest office.

Everjet Elastic Paint
Low in price. Great in durability. Invaluable for prolonging the life of ready roofings, fences, iron work, etc.

Creonoid Lice Destroyer and Cow Spray
It will keep flies away from the cows. It will keep lice and nits away from the poultry, make everything sanitary and increase their output.

face and neck from contact with the blanket. The blankets must be tucked in at the foot and sides, the spread must be arranged less securely so that it may be taken off when opening the bed without loosening the covers.

How to Remove Inkstains from Carpets.

After many tests, it has been found that common milk is one of the best substances for removing inkstains from carpets, rugs, or any similar fabric. The method may be old to some housewives, but it is worth repeating and pasting in some convenient scrap book. First remove as much of the spilt ink as possible with a spoon or knife. A blotting pad is even better. Then pour cold sweet milk over the stain, and after it has been allowed to stand for a minute or two, take it up with a blotter. The milk will absorb a good deal of the ink; but the process must be repeated several times until the milk has no stain of the ink on it when taken up. Mix a little lemon juice in cold water then, and wash the stain carefully, finishing by rinsing in pure cold water. Rub softly while the water is drying. If the stain is an old one, a different process must be adopted. Purchase at the druggist's a little crystal of citric acid, and moisten it and rub over the stain. By repeating the operation the inkstains, no matter how old, will finally vanish.

FLORICULTURE

From now on, throughout the summer, a constant warfare must be maintained against insects. As soon as foliage appears you will find them at work. Spray your roses, gooseberries, currants and shrubs with hellebore, a heaping good spoonful to two gallons of water, kept well stirred up and sprayed in fine weather. This spray will kill many varieties of larval forms of insects and should be repeated at intervals of two or three weeks until August. The pear slug, which attacks the pear, thorn and other hardwood plants, in June and July, is harder to kill and an emulsion of paraffine sprayed on the foliage is a sure cure. One of the best formulas for making it is by taking a quantity of slightly sour milk, agitate this milk with two quarts of paraffine until it will form a white butter-like substance. Dissolve one part of this butter in fifteen parts of water, agitate to mix thoroughly and spray. This is useful to kill larval forms of all insects and used as above will not injure tender foliage. It will kill green fly and all soft insects. The butter can be kept some time, if in a cool, dry place. Insect pests seem to increase every year, and unless more care is taken to exterminate them, as much as possible, it will soon be a hard fight to keep foliage on plants. The government should act in this matter, and assist in the work of repression of insect life. Although, at first, the cost might appear large, increase in crops will recoup the initial expense. This has been proved elsewhere, hence is no experiment. Individual efforts can do much, but when intelligently directed from a properly organized centre the work is much more effective.

Plant Lover, writes:—I have a pink and white Tuberous Rooted Begonia. They have bloomed nicely all summer, but now they are looking badly. The leaves have turned yellow and dried up and only a few on top of the stalk seem to be growing. The roots look healthy. Should it be repotted? It is apparently quite root bound.

Your Tuberous Rooted Begonias having bloomed well all summer are now ready to rest and should be dried off in the pots, as they are. As soon as the soil is thoroughly dried and the tops have withered the tubers can be removed from the soil and placed in cotton wool and laid away for the winter, in a dry, cool place. Of course, they need not be removed from the pots if they are very closely watched in early spring, as they are, if in soil, often start earlier they are, they often start earlier would require attention earlier than if in the wool. Now is the time for them to look their best both in the house and in the beds in your garden or lawn.

Nova Scotia Provincial Exhibition will Open at Halifax on August 30 to September 7th.

In a little more than two months hence the Nova Scotia Provincial Exhibition will be in full swing.

In order that the Fair will not conflict with the County Exhibitions it has been decided to open earlier in the season.

Benefitting by the experience gained in two years, and with the visitors demand for amusements, the Commission have decided to return to the attraction features in front of the grand stand.

The manager has just returned from New York where he has booked one of the best programmes ever placed before the people of Nova Scotia.

The Speed Programme, judging from the number of entries received in the stake races which closed June 1st, gives promise of being the best race meeting ever held on the track.

With the programme such as is arranged and the fair being held at a date when the patrons of the fair can be comfortable on the grand stand, should bring thousands to the fair daily.

Prize lists have been mailed to all previous exhibitors but any person who have not received copies can have same mailed to them by writing the Secretary M. McF. Hall.

Dr. McLaughlin's Electric Belt is Made for You

To those whose vitality is exhausted and who find themselves, young in years, broken-down wrecks of what they ought to be, the Dr. McLaughlin Electric Belt is full of encouragement. It is the success of the age in elevating the condition of those suffering from a loss of vitality.

Are you a weak person? Are you nervous, fretful and gloomy? Is your sleep broken? Have you pains and aches in different parts of your body? Is your back weak and painful? Have you lost the vigor of youth? Are you rheumatic or gouty? Does your back ache? These are the results of the waste of vital force. The gentle stream of Electricity from my Belt going into the nerves and weak parts for hours every night soon replaces all energy and makes every organ perfect. It is worn while you sleep and pours a steady stream of Electricity into nerve centre, saturating the weakened tissues and organs with its life. This is strength. From it come the vim, the egergy, the fire of perfect and mental action. It renews health and happiness.

This Belt, with special Electric Attachment, will restore your vigor. It will check all loss of vitality, and affects every organ of the body. It cures Nervous Debility, Rhumatism, Lame Back, Lumbago, Sciatica, any case of Kidney Disease that has not gone as far as Bright's Disease, Stomach Trouble, Constipation and Rupture.

Baker Lake, N. B.

Dear Sir :—I received the Belt O. K, on he 8th, and am perfectly satisfied with it. My back does not bother me the way it used to. To-day I finished up three shifts, two nights and one day, and I feel all right. I had to fire a locomotive twelve hours of that time. If I should have had to do that six weeks ago, I would have been played out.

Yours very truly,
G. M. DOUGLAS,
C-o Cavicchi & Pagano, Camp No. 4.

Man of 63 Feels Like a Young Man

Wells P. O., King's Co., N. B.

Dear Sir:—Your Belt has done me a lot of good. I think I have done extra work enough during the time I have worn it to pay for it, besides the comfort of having good health. In fact, I almost feel like a young man.

Yours truly,
JOHN V. B. FOSTER.

Woodstock, N. B.

Dear Sir :—I write to let you know that your Belt has done wonders for me. I have not felt any pain in my back since I put it on, and I think it is a wonderful thing for pain in any part of the body, and I would strongly recommend it to all.

Yours truly,
M. B. CRAIG

This Fence Has Vast Strength

For a fourth less than the price we pay, we could get hard-drawn steel wire. But that kind, though used in most other wire fence, hasn't the *life*, the springiness, the strength we insist on for Maritime Wire Fence.

• • • •

So we make this fence of extra-heavy hard drawn steel wire of nine-gauge. Constantly we test it for quality. And so we *know* this fence has *more* strength than it probably will ever need.

• • • •

Yet the price of Maritime Wire Fence is no higher than you must pay for ordinary fence. But the life of the Maritime Fence is far longer—and the fence surely reliable.

• • • •

On this extra-quality wire we put a smooth, even heavy coat of galvanizing. We put on more than enough — that's our way. You gain by the longer life of this better fence. And we lock laterals and upright wire rigidly, yet springily, with a cross-leverage lock that simply CANNOT let go under the hardest strain.

• • • •

You can bank on the strength of this fence Make the test for yourself and your neighbors. Then get the agency—it will pay you well. Address

NEW BRUNSWICK WIRE FENCE CO., Ltd., Moncton, N.B.

MARITIME WIRE FENCE

What the St. John's Agricultural Society is Doing.

Eight thousand dollars worth of fertilizers, seed potatoes, seed oats, cattle feed, lime, turnip seed, carrot seed, parsnip seed, barley seed for poultry feed, and buckwheat, all of guaranteed quality, has been imported by this Society for members only, and will be delivered during the month at cost, as advertised. Several farmers have purchased as much as three hundred dollars worth of this stock, paying cash down. Few people realize the great outlay of a farmer in the spring. Only yeaterday, Mr. Henry Cowan paid the sectetary $400 for his stock of fertilizers and seeds, besides large quantities purchased outside.

The Society, to date, has decided on not distributing any free seeds, this year, as was done last year, but is selling at cost, and in any quantity, to bona fide farmers and gardeners. At George Neal's, Beck Cove, these people can, by merely giving in their names and addresses, and thus becoming members of the Society, obtain all these seeds. There the Society's fertilizers can be obtained: Nitrate of soda, superphosphate, dissolved bone, sulphate of potash, sulphate ammonia, bone meal, basic slag, English, Irish and Scotch potatoes, Green Mountain potatoes, white variety, Sutton's 'Earliest and best,' and Dickson's 'White Beauty,' 'Irish Cobbler, Early Bliss Triumph,' very much like 'Quick Lunch,' which is a cross between the Irish Cobbler and Bliss Triumph, but which, like the 'Dakota Reds,' could not be obtained owing to the scarcity of good seed potatoes in the Maritime Provinces; also, E. J. Snow's well known superior 'White Blossom' potatoes, local, best Scotch Banner Oats, hand and machine selected, and small quantities of a few other varieties of seed oats. The Society is also experimenting in the several new varieties of oats, such as: 'Sixty Day,' 'Danbeney,' 'Sedar,' etc. 'Alaskan Wheat' sugar beet, etc.

A good library has been started and rooms obtained in the British Hall for regular Executive meetings of the society on Saturdays, and general meetings quarterly. A Stock Breeders' and a Seed Growers' Branch are under consideration, for raising local pedigree stock, so that it can be readily seen the Society is doing all that is possible for the farmers.

Only recently, through the efforts of Mr. S. Ruby, a valuable deposit of limestone was secured by the Society for agricultural purposes. The importation of more threshing machines and live stock is receiving attention; and the Society has also adopted the "Maritime Farmer and Co-Operative Dairyman" as its official organ, and free specimen copies are being sent to every farmer in the district, giving exactly the information farmers require, and answering any questions members submit to it, entirely free. Already a great any have subscribed to the journal at the cash price 80c. a year, and speak in good terms of its great help and practical value to them, so that it is hoped eventually hundreds will take it, and the cost be correspondingly reduced, for "Unity is strength, and should advance through the medium of the society and its official organ, every farmer in the land."

The foregoing clipping which appeared in a recent issue of The Daily News, St. John's, N'f'l'd., was sent us for publication by the efficient secretary of the Society. Mr. P. G. Butler.

Cheap Fares for the Holiday Season.

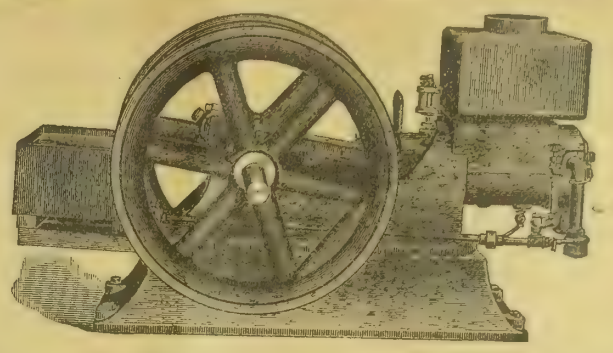
For Dominion Day the issue will be on June 60th and July 1st, good for eturn July 4th, between all stations n the line and to points on connecting lines.

More Praise for I. C. R. Publications.

A gentleman highly connected with one of the largest New York daily papers, recently wrote to the Publicity Department of the Intercolonial Railway, concerning "Forest, Stream and Seashore," the largest and most mportant of I. C. R. publications. He had just had a conversation with a leading advertising man of Philadelphia who had spoken in glowing terms of this publication, declaring it to be one of the best he had seen in the way of railway literature. Reading its pages had induced him to take a trip to Nova Scotia and the Magdalene, and then to Montreal. This is appreciation from a competent authority, attended with most practical results.

The Solid Facts of Summer Travel.

"Summer Fares to Summer Haunts" is the title given to a very practical booklet issued by the Intercolonial Railway. As the name would imply it deals with the question of reaching the various summer resorts along the line of the railway, and furnishes the details regarding routes and rates, hotels, etc. It is a booklet of plain travel facts, just what the practical tourist needs. The pages devoted to side trips will be found interesting by those who do not realize how numerous are the possibilities for delightful holiday excursions at very reasonable expense. This book will be mailed free to all who write the Advertising Dept., I. C. R., Moncton, N. B.



The Waterloo Boy Gasoline Engine

s like a lot of people you and I know. It improves on acquaintance. You must know it to appreciate it.

The Waterloo Boy will develop more power and do a lot heavier work than you ever expected.

You can always depend on it. You know what it will do. It is so simple your 10 year old boy can be engineer with perfect success.

The old reliable fly ball governor keeps the speed steady. It has a patented mixer and new postitive igniter. Automatic fuel regulation makes it economical.

The speed lever will vary the speed from 50 to 75 revolutions while running.

Starts easy in winter; always ready without fuss or bucking; open jacket frost proof. Nearly all parts interchangeable.

Farmers are "boosting" Waterloo Boys more than any other engine. Does that prove anything?

Let us tell you more. Our Catalogue is free. Write to-day.

The Waterloo Gasoline Engine Co.
J. D. FRIER, Sussex, N. B., Eastern Representative.

"It cured me," or "It saved the life of my child," are the expressions you hear every day about Chamberlain's Colic, Cholera and Diarrhoea Remedy. This is true the world over where this valuable remedy has been introduced. No other medicine in use for diarrhoea or bowel complaints has received such general approval. The secret of the success of Chamberlain's Colic, Cholera and Diarrhoea Remedy is that it cures. Sold by all dealers.

A Peculiar Diseases.

(Continued from page 661)

to enable us to diagnose the disease. It may have been the result of an injury, such as a blow followed by blood poisoning. But this is not positive. If another case occurs have a veterinarian examine the animal during life and if it dies have a careful post mortem examination to discover the disease and then intelligent treatment can be administered. Without knowing what the disease is, intelligent treatment cannot be given. —J. Standish, V. S.

Weak Fetlocks.

J. J. S.—I have a Clydesdale mare, three years old, that was weak in fetlock joints all winter, knuckled at times. This spring she is swelled in the joints, the most in back of hock. What is the cause and what treatment would you advise? Would you advise working mare or driving a little for exercise or turn her out in pasture for the summer? Would it be injurious to breed her this season and give her another year to grow without working her.

Ans.—This trouble may have been caused by the hoof growing too long at the toe or by slipping, thereby injuring the fetlock joints, or the tendons or ligaments in the back part of the leg. Or, the injury may be in the hocks or heels. It will be well to have a veterinatian examine her and discover the exact location of the disease. I suppose she is not lame, as you do not mention it, therefore, I will advise levelling the feet properly, shortening the toes, then breeding her and turn her to pasture for the summer and when she is taken in in the fall keep her in a roomy box stall with a level floor.—J. Standish, V. S.

BUILT WITH CONCRETE BLOCKS
MADE ON
"IDEAL" FACE DOWN MACHINES

Grain Bin, built of Ideal Concrete Blocks, for The Marine City Roller Mills Co, Capacity, 5,500 bushels of wheat. Cost complete only $860.

Even if you are going to build only one barn, silo or grain bin, it will pay you to buy an Ideal Concrete Block Machine.

It will enable you to make your own building material right on the spot, saving long hauls and delays.

You can make the blocks yourself, saving labor.

And you will have a building that will be absolutely fireproof, and last for all time without a cent for repairs.

An Ideal Machine will save you many times its cost, and enable you to have buildings as durable as stone for ⅓ the cost of brick.

STOCK NOTES.

FINEST JERSEYS IN CANADA.

Last week, J. L. Alexander, of the firm of Edwards and Alexander, proprietors of Maplehurst Farm Coaticook, P. Q., took twenty three head of young purbred Jerseys from Sussex to the concern's stock farm. Mr. Alexander is not a stranger to Sussex and its dairy herds and moreover he is not backward in giving the highest praise to the breeders of purebred stock, in this vicinity. For a number of years he has been coming here for females and the attraction lies in the fact that he can get better stock hereabouts than in any other part of the Dominion. Several years ago he purchased from Walter McMonagle, Brownie of Glenview, with a record of 636 pounds of butter; Lady Perdo, record of 567 pounds; and Georgie of Glenview, with a three-year-old record of 512 ponds. Out of seven head secured from Mr. McMonagle, Mr. Alexander states that six are in the advanced registry as producers, the seventh having been injured in a railway accident. The advanced registry calls for 460 lbs. of butter in one year, so that as producers, the Kings County stock has more than made good.

On his last trip Mr. Alexander bought eight calves from Walter McMonagle, five from Elkanah Hall, four from Robert Robinson, four from W. H. Holman and one from Byron McLeod, or twenty-three in all. He was delighted with the quality of his purchases and talked freely with a Record representative of the splendid types to be found in the dary herds of this county. "The best producers in Canada" was the way Mr. Alexander put it, and he was outspoken in his declaration that no finer dairy cattle were being bred anywhere in the Dominion than right here in the vicinity of Sussex. As a breeder Mr. Alexander has had a wide experience and during the past few months he has sold thousands of dollars worth of purebred Jerseys. The call for stock from this section has been good and so long as the present standards are maintained, Mr. Alexander feels that there will be a big demand for dairy cattle from here. The fact that such high testimony is given to the product of local breeders by a competitor from Quebec should be an excellent advertisement for the dairy herds of Kings County. In the past Maritime Province buyers have been in the habit of going to Quebec and Ontario for cattle and paying higher prices than dealers were asking right here for better stock. This sort of thing is most discouraging to the men who have invested large sums in trying to breed superior stock and Mr. Alexander's

PAQUET GUARANTEED CLOTHES

THE MOST PERFECT METHOD OF Clothes Making Yet Devised.

CLOTHES, to fit perfectly, MUST be made to measure. The old-fashioned, Ready Made Clothes are all made to fit AVERAGE types, not REAL men. That's why they don't fit YOU. Saved From Destruction by the Acme Steel Ladder

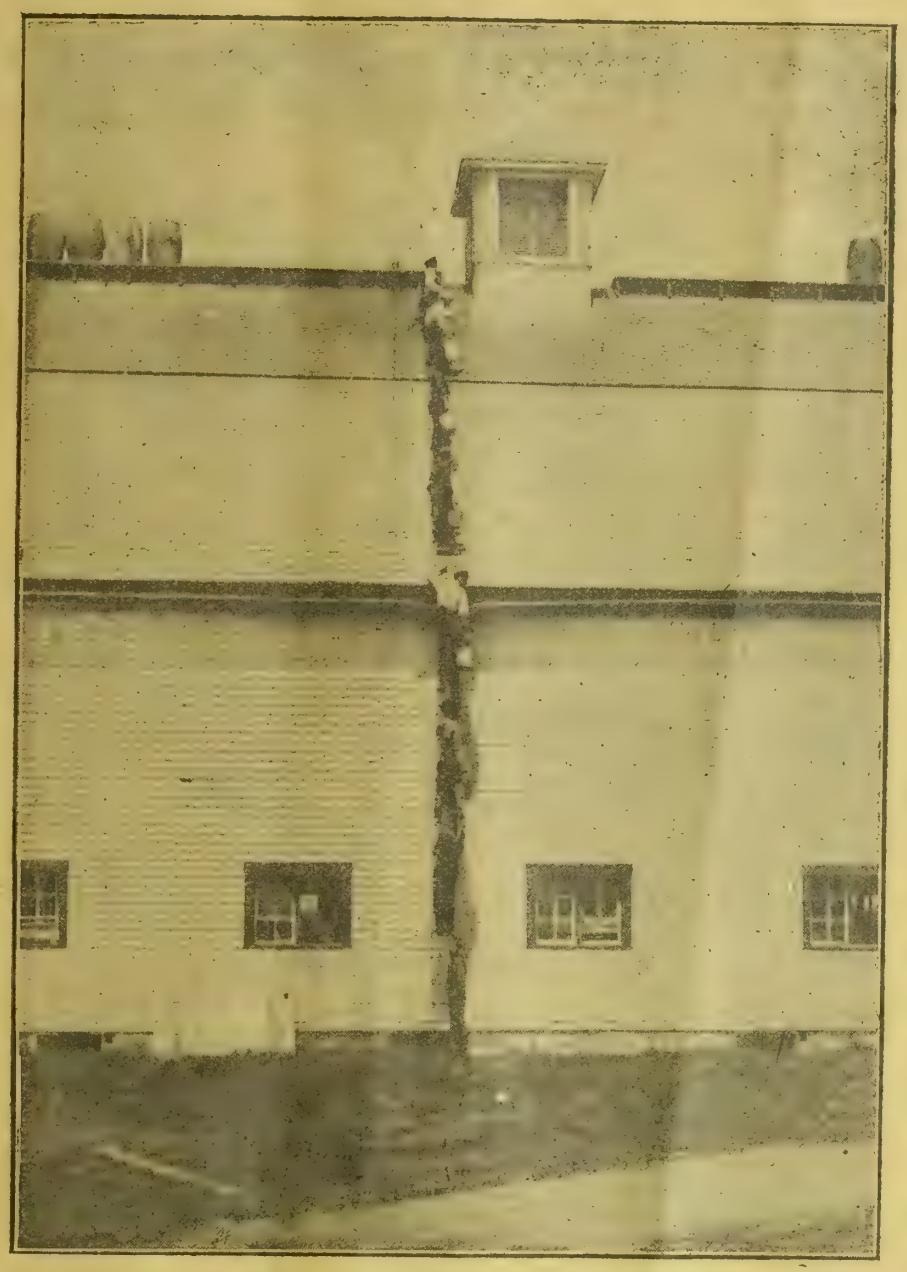
THE Acme Steel Ladder has now been on the market for only about four years and while we have made many claims for it in case of fire, the first real test it ever had was at Forest Glen on the 9th of May, this year. The large barn belonging to the S. H. White Co., Ltd., took fire from a spark which came from the waste burner at their mill. The fire started near the peak and as there was no other fire fighting appliances, the men in the vicinity formed themselves in a bucket brigade, starting at the river bank and continuing to the peak of roof, thus enabling them to fight the flame. The fire actually got into the hay.

Forest Glen, N. B.
June 24th, 1911.

ACME STEEL LADDER CO.
Sussex, N. B.

GENTLEMEN :—On May 9th our large hay and feed barn caught fire from a spark from the waste burner of our mill. The fire began on roof at the top of building and had it not been that the sides and roof of our barn were well covered with your Acme Steel Ladder, the building would have been completely destroyed. Your ladder was of sufficient strength to carry 25 men, each with a bucket of water, which feature soon made it possible to extinguish the flame. We cannot say too much in praise of your steel ladder, which has in every particular done more than you claimed for it. All our buildings have been equipped with your ladder and we believe that in this way our property is as fully protected as if we were carrying heavy insurance. We cheerfully recommend your ladder to all prospective buyers.

S. H. WHITE CO., LTD.
per C. R. COLPITTS,
Manager.



The above is a picture of barn which caught fire on May 9th and which was saved by being equipped with Acme Steel Ladder. Twenty-five men were on this ladder at one time.

Sussex, N. B.
June 24th, 1911.

ACME STEEL LADDER CO.

GENTLEMEN : — I had occasion a short time ago to adjust a loss by fire at Forest Glen and I found the building that had been damaged by fire had been equipped with your Acme Steel Ladders and I am quite satisfied that these ladders were the means of the building being saved from total destruction and I heartily recommend them to all interested.

H. A. WHITE,
Insurance Agent.

If your buildings are not equipped with the Acme Steel Ladder you are running a great risk. The cost is nominal and besides steel ladders last a life time. They are always in position as you are not likely to lend them as you would other kinds. You are always protected if your buildings are equipped with Acme Steel Ladders. remarks should help to put an end to this sort of thing. One instance of this sort of thing was relerred to by Mr. Alexander in connection with the purchase of a Jersey bull by an Agricultural Society at Sherbrooke several years ago. A young bull was selected by the representative who went to Quebec to make the purchase. The animal was shown later at the Sherbrooke exhibition and was easily beaten by Mr. McMonagle's young bulls. The Nova Scotia agricultural society paid just three times as much for the animal as Mr. McMonagle had asked lor his bull, and the Quebec breeder got the money.

Mr. Alexander's opinion of Jerseys is just as true of our Ayrshires. Year after year the Ayrshires of Kings county have beaten exhibits from Quebec and Ontario but in season an out of season, the pilgramage to Upper Canada in quest of inferior stock at high prices continues. The fact of the matter is that stock buyers of the Maritime Provinces have been encouraging a sentiment that is making them poor. They are sitting tight and allowing outsiders to come in and get bargains that they should be taking advaneage of. It is time that they were awakened from their long sleep. Mr. Alexander has given them the benefit of his shrewdness and a lot of good advice. They should avail themselves of it.—Kings County Record.

HORSE BREEDERS are following with interest the work of the department of agriculture at Washington and the Vermont university in perpetuating and improving the famous Morgan type of horse. It was announced a few days ago that another installment of brood mares had been bought of the Willowmoor farms of Redmond Washington. The purchase includes five brood mares, one four-year-old filly, one three-year-old filly,

MAIL CONTRACT.

SEALED Tenders addressed to the Postmaster General, will be received at Ottawa until noon, on Friday, the 11th August, 1911, for the conveyance of His Majesty's Mails, on a proposed Contract for four years, 3 times per week each way, between Sussex and Sussex from the Postmaster General's pleasure.

two yearling fillies and five two-year-old and yearling stallions. One of the mares is Moxie, grand champion at the Alaska-Yukon-Pacific exposition in 1909. These horses will be taken at once to the Morgan horse farm at Middlebury, Vt., where breeding work is being carried on with a distant object of preserving and improving the Morgan breed.

SHIPMENT OF CLYDESDALES.—Upwards of one hundred and forty Clydesdale horses and mares were shipped to Canada from Glasgow, on Saturday, the 27th May. Mr. W. J. McCullum & Brothers, Brampton, Ontario, took away about 56 head, nearly the half of them entire colts, including the second prize two-year-old at Ayr. The latter is a handsome son of the famous Baron of Buchlyrie (11263) out of a mare by the champion horse Labori (18791). Mr. Jas. Scott, Waterloo, Ontario, shipped forty handsome fillies acquired from Mr. J. Picken, Torrs, Kirkcudbright. They are by such well known sires as Count Victor (12108!, King of Kyle (10213), Lathrisk Baron (11392), Clan Favorite (14629), Chester Prince (11876). These fillies are all big stylish animals with abundance of quality and the best of feet and legs. Messrs. Vanstone & Rogers, Wawauesa, Manitoba, had four colts from Mr. James Picken. Three of them are three-year-olds, one being by the Baron's Pride horse May King, another by Gallant Fauntleroy, and the other is by the Park Mains' stud horse, Sir Hugo. This colt has gained quite a number of prizes at local shows. The fourth colt is a son of Revelanta out of a Look Again dam. These colts are all of the robust type, with lots of substance and good wearing eyes and feet. Another consignment of eight fillies has been taken by Mr. George G. Stewart, Howick, Quebec, from Mr. T. R McNagan. Williamston, Crieff. All of them are of first-rate breeding, their sires including Baron Barsalloch (13362), a son of Baronson, the sire of the champion Oyama; Silver Simon (13752), Picnic (12124), Baron's Best (11 97), by the great Baron's Pride (9122), Dunnydeer (12 57), by Sir Hugo, Baron McNee (12462! by Baron's Pride, Perfect Motion (13123) by the noted Baron of Buchylrie (11365), and MacCarie II. (13638) by MacCarie (10590). Such an infusion of new blood cannot fail to be beneficial to the studs of the Dominion. McHugh Greenless, Bowmanville, Ontario, takes out three fillies of excellent breeding. They are from the hardy race of Clydesdales, which are to be found in Kintyre. Two of them are two-year-olds bred upon first class sires. Mr. Wm. Taylor's grand horse, Lord Delment (13599) is responsible for one of them, the dam being of the same owner's noted Sir Hugo. The other is got by Baron's Best, which, by the way, is a first prize winner at the Highland and Agricultural Society's show, and the mother is by Rosedale (8194), another Highland show winner. A yearling is got by the 1.00 gn. horse Silver Cross (11184), a Highland Society and Royal winner, and the dam of this filly is by Sir Hugo. These fillies should win much distinction in the Canadian show ring.

HOLSTEIN HERD BOOK.—With a membership of 4,280 and a total of 70,590 certificates issued during the year the Holstein breeders of the United States have a strong organization. At their annual meeting, on June 7th, a committee of three, including the president, was appointed to investigate and confer with the committee of the Canadian Association in regard to giving full recognition to the herd records of the Canadian Association. The president, Chas. W. Wood, of Worcester, Mass., in his annual address referred to the matter in the following terms:—

"During the year the prosperity of this breed has been equally manifest throughout the Dominion of Canada, and our Canadian neighbors and our Holstein friends, members of the Canadian Holstein-Friesian Association are very generally emulating the wisdom and practice of this association These cattle are the favorites among dairymen there, as they are in the United States. Their Herd-Book is conducted on lines similar to ours, they have a large membership, and a handsome cash surplus of over $10,000 in the treasury. The United States Association, however, in no way recognizes the Canadian Herd-Book. United States buyers have ta-

PEDLAR Nestable Corrugated Galvanized CULVERT

Is The Strongest, Most Practical, Durable and Easiest Laid Culvert Made

YOU ought to show this advertisement to your township reeve or warden. Get him to write for the free book about Pedlar Culverts, or write for it yourself and tell him about this new Culvert—the quickest, most economical, strongest for any use any culvert can serve.

See How It Saves Farmers' Money, Betters Roads, Lowers Taxes

This picture is from a photo of a washout fourteen feet deep in the Township of Darlington, caused by use of cement tile for drainage purposes. The township authorities have replaced that with Pedlar Perfect Culvert, forty feet in length by three feet in diameter; strongest, easiest laid and most durable they could get.

This picture of the Pedlar Perfect Culvert assembled and ready to lower into place, shows the immense strength and rigidity of these Culverts. Though forty feet long with a bearing of only a few feet at the centre it does not give one-sixteenth of an inch. See how easily Pedlar Culvert can be lowered into place. No skill needed.

Here you see the Pedlar Culvert doing its work of drainage twenty-five minutes after being put in place. It would have taken three times as long and cost three times as much to have installed any other type of culvert. Yet this Pedlar Culvert will last far longer and give no further trouble of any kind.

This view shows the Pedlar Culvert after the fill-in was completed. The Culvert has to carry a dead weight of several hundred tons of earth, as well as the live weight of traffic passing overhead. But that can't strain Pedlar Culvert, which will neither give nor spring. It stands what no other culvert can.

Write For My FREE Book No. 60 and Sample

And get a correct idea of what makes a good Culvert. Learn how Pedlar Culvert can be used on your farm.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Harbour Works in Courtenay Bay, St. John, N. B.," will be received until 4.00 P. M., on Thursday August 10th, 1911, for the construction of a Breakwater, Wharves, for the Dredging of a channel and basin, and for the Filling shown on plan and also for the Construction of a Dry Dock and Ship Repairing Plant of the First Class under "The Dry Docks Subsidies Act, 1910."

Plans, specification and form of contract can be seen and forms of tender obtained at this Department, at the offices of E. T. P. Shewen, Esq., District Engineer, St. John, N. B; J. K. Scammell, Esq., District Engineer, St John, N. B.; C. E. W. Dodwell, Esq., District Engineer, Halifax, N. S.; A. R. Decary, Esq., District Engineer, Post Office, Quebec; J. L Michand, Esq., District Engineer, Merchant's Bank Building, St. James St., Montreal, Que.; J G. Sing, Esq., District Engineer, Confederation Life Building, Toronto, Ont.; H, J. Lamb, Esq., District Engineer, London, Ont.; and at the office of the High Commissioner for Canada, London, Eng.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied, and signed with their actual signatures, stating their occupations and places of residence. In the case of firms, the actual signature, the nature of the occupation and place of residence of each member of the firm must be given.

Each tender must be accompanied by an accepted cheque on a chartered bank, payable to the order of the Honourable the Minister of Public Works, for the sum of five hundred thousand dollars ($500,000.00) which will be forfeited if the person tendering decline to enter into a contract when called upon to do so, or fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The Department does not bind itself to accept the lowest or any tender

By order,
R. C. DESROCHERS,
Secretary.

Department of Public Works,
Ottawa, June 9, 1911.

If you are not satisfied alter using according to directions two-thirds of a bottle of Chamberlain's Stomach and Liver Tablets, you can have your money back. The Tablets cleanse and invigorate the stomach, improve the digestion, regulate the bowels. Give them a trial and get well. Sold by all dealers.

ken seventy-two cattle from Canada the past year, but before those cattle can be recorded in our Herd-Book each of their ancestors must be recorded, involving a large expense, often reaching from $30 to $100. The placing of the seventy-two head on our records involved the registration of 366 others to make them eligible.

"The Department of Agriculture of the United States recognizes our Herd-Book with which we are affiiated. In order to import cattle for breeding purposes and free of duty, it is necessary that such cattle be recorded in recognized or affiliated Holland Herd Books. The Canadian Herd-Book is not so recognized at present. The question has been raised by the United States authorities as to our attitude in this matter and with you rests the responsibility of answering it.

"While I recognize that there may be differences of opinion, I find myself restricted by no hesitation in declaring to you in the most unqualified manner, that I believe some method should be adopted to place these cattle across tne line on a par with our own.

"Twice during the year it was my privilege to cross the line for the special purpose of investigating this question in all its phases, each time having accepted an inviataion, once from the Fair Committe at Sherbrooke, the next from the Canadian Association's officers to visit their annual meeting at Toronto. In each instance I met with a charming reception and observed a most interesting revelation, both as to the question of the quality of the cattle that are to be produced across the line and, as might readily be expected, the intellegence and integrity of the men engaged in breeding this class of cattle in Canada. We can well afford to throw down the dividing line and allow our cattle to flow over into that section, and having been nurtured, fed, and developed, their progeny will drift back into this territory. The demand for Holstein-Friesian cattle, as I have previously said, is such as to exceed, by a large percentage, the possible production or supply. We therefore owe it to ourselves from a financial standpoint, and we owe it to our neighbors from a reciprocal standpoint, to indulge in some such legislation. I recommend the appointment of a committee, endowed with the authority and empowered with the responsibility of investigating this subject with a view to this end. Whether it should be by the uniting of records, by mutual exchange or some other method, I advise awaiting their investigation and report.

"I am informed that a similar committee has already been appointed by the Canadian Association, who are agreeable to an early conference. I cannot speak tao highly of my visit at the Canadian Association. Its officers are the very embodiment of courtesy and the kindly and fraternal regard manifested by that association towards this one, was to me a genuine benediction."

COLORS OF HOLSTEINS.— The Holstein-Friesian Association of the United States has adopted a regulation barring animals of certain color and markings from registration. These colors are as follows:—

(1) Solid black. (2) Solid white. (3) Black switch.

(4) Solid black, with white on belly only.

(5) Black on legs, beginning at feet and extending to knees and hocks.

(6) Black on legs, beginning at feet and extending to knees, with white interspersed.

(7) Grey, or mixed black and white generally prevailing.

(8) Patches or other colors than black or white,—red, brown, dun, etc.

(9) Red and white.

While striving to retain the characteristics which have made this breed known as the leader of dairy breeds for more than two thousand years, anh while endeavoring in all ways to attain still greater perfection, the members of the association are not losing sight of the faet that beauty of color and markings has a marketable value and an important bearing.

Perpetual Youth.

Let Me Tell You How to Regain All Your Old Vim, Vigor and Manly Strength. Be a "Health Belt Man;" Feel Young for Balance of Your Life. Age Doesn't Count if You Have the Vitality.

"I could shout for joy. After years of Weakness and Debility your Wonderful Health elt cured me. I am a man again. Use my name as you see fit."

eo n Turpinat,

tellarton, N

Perpetual youth. That is precisely what I mean. I say as man to man give my Health Belt a reasonable chance and it will carry you through any business, mental or physical strain you may be under. It doesn't stimulate; it simply adds the electro-tonic element to your bone, nerves, tissue and blood; all the force and strength which has been drained from your system by some earlier indiscretion. My Health Belt is essentially a strength giver. It overcomes the private symptoms of weakness in men which sap the vitality. If you are nervous and lack manly vigor, you are passing away thousands of brain cells every day. Ask your physician if this is not true. I stop this awful weakening process. You wear my Health Belt nights; while sleeping a great stream of soft electricity passes into your body at the small of the back; it cures backache in one application; you feel better immediately; inside of an hour; two months will make a new man of you. No drugs; no privations; no restrictions except that you must give up all dissipation. Follow my advice and I promise you will feel younger and look younger. Let me restore your vitality, and you will be able to face the world with new ambitions The Health Belt cures other ailments too. A positive remedy for rheumatism in any part of the body, sciatia, lumbago, kidney, liver, stomach disorders.

Special attachments furnished, and worn by women as well as men.

FREE UNTIL CURED.

Call or write to me and I will at once arrange to let you have the Belt on trial, not to be paid for until cured. No deposit or advance payment, Send it back if it doesn't do the work. Liberal discount for cash if you prefer to deal that way.

Let Me Send You These Two Books FREE.

They fully describe my Health Belt and contain much valuable information. One is called "Health in Nature" and deals with various ailments common to both men and women. The other, "Strength, the Glory of Man," is a private treatise for men only. Both sent upon application, free, sealed, by mail.

If in or near this City, take the time to drop in at my office that you may see, examine and try the Belt No charge for professional advice either at my office or by mail. If you cannot call, fill in the coupon and get the free booklets by return mail. They are better than a fortune for any one needing new vigor

MARKETS.

St. John Markets.

St. John, June, 27th.—The market of late has been poorly supplied. Meats of all kinds but veal, lamb and mutton has been very scarce. To-day has made a marked change. The prospects are looking more encouraging for better markets, the early gardening stock is coming in quite plentiful. Berries has made their appearance to-day and finding good sale 25 to 30c. per box retail, about 18c wholesale, at the boats the coming week looks well for larger market. I find the Western beef is taking the place of our province beef. There are two concerns in the city who are doing a thriving trade The farmers will have to put better stock on the market to hold their business.

Oats, 50c. to 55c. per. bush.; Buckwheat, $2.25 to $2.50.

Bran, $23.00 a ton; Corn Meal, $1.37 per cwt. by the ton.

Butcher's Cattle, 4½c to 5½c; Stockers, $5.65c Milch Cows, $40 to $50; Sheep, $4 to $6; Lambs, $3 to $4; Hogs, $6 to $8.

Beef (retail) 10c to 20c.; Mutton, 10c. to 15c.; Veal, 10c. to 12c.; Lamb, $4 to $6; Pork, 9c.

Drafters, $225; Rooadsters, $175 to $200; Carriage, $150 to $175.

Creamery Butter, 25c. to 26c.; Dairy Butter, 20c. to 22c.

Eggs, 18c. to 22c.; Fowl, 90c.to $1.50; Chickens, $1.00 to $1.50; Turkeys, 18c. to 20c. per. lb.

Apples, $3 to $5 per bbl.; Cheeries,40 c.per box; Honey, 25c. to 30c. bottle; Maple Products, 1.25 gal., Sugar, 16c. lb.

Carrots, $1,25; Potatoes, $2.00 to $2.25; Turnips, $1,00; Beets, $1.25.

Hay,$10 to $12 a ton; Straw, $6 to 8 a ton;Wool, 21c. washed, 14c.; Beef Hides, 10c., Calf Skins, 16c.; Sheep Hides, 10 to 25; Lamb skins 10 to 25.

Charlottetown Markets.

Beef (quarter) per lb, 8c. to 10c.; Beef (small) per lb., 8c. to 16c.; Beets, per bunch, 4c. to 5c.; Butter, 18c. to 20c.; Mutton, per lb., 9c. to 10c.; Lard, per lb., 16c.to 18c ; Mutton (small) per lb., 9c. to 12c.; Potatoes, 40c. to 45c.; Straw per ton, $5.50 to $6: Celery per bunch 5c.; Radishes, per 3 bunches 3c. to 5c.; Lettuce per bunch, 5c. White Oats, 36c.; Black Oats, 38c.; Eggs, per dozen, 14c. to 15c.; Hay per ton, $5 to $9: Calfskins, (free of heads) 11c. to 12c.; Hides, 7½c. to 8c.; Turnips, 15c.; Pelts each, 45c. to 60c.; Ducks, 12c ; Fowl, 9c. to 11c.

Nova Scotia Fruit Crop.

It is expected that Nova Scotia will have a million barrels of apples for export this year,or 200,000 above the best previous record.

Lamb Crop in the West.

From the American ranches come reports of a good lamb crop this year. What is considered a good crop is one of 65 per cent. to 70 per cent.

Big Apple Crop.

Prospects are for a bumper apple crop in the United States this year. In Michigan, Missouri and Kansas the ourlook is promising and prospects are reported even better in the Middle and Eastern States. In Western New York reports are almost uuiformable.

Co-operation in Nova Scotia.

"Three] years," says G. F. Chipman of the Grain Growers' Guide, "the first co-operative apple shipping association in Nova Scotia was formed at Berwick, with S. C. Parker as organizer. Since then eleven organizations have been formed. Each one of these organizations has its own central warehouse where apples are put up, and each also has its own sale agents. It is proposed to unite all these several organizations with one sales agent for the whole. In all cases the producers have obtained better prices since co-operation was undertaken than they secured before.

Looks Like Small U. S. Potato Crop.

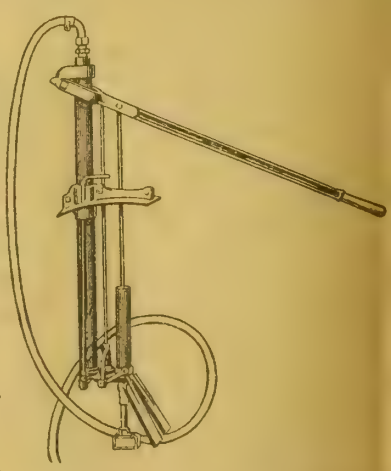
Owing to the abundant supplies and consequent low prices which prevailed in the United States last year American potato growers seem to have become discouraged. In any case there are reports of lessened potato planting in the United States this year. Moreover, as the ground was dry at the time of planting, the crop has made poor progress and is from one to two weeks late. The present outlook is for restricted supplies and high prices of potatoes in the United states in the coming fall, and if reciprocity goes, through, there should be a good market there for the Canadian article.

A Dirty Carpet
Or a Clean Painted Floor!
WHICH IS BETTER?
You KNOW which YOU would sooner have. You know which LOOKS the best and is the easiest to KEEP clean. Better decide now to freshen things up right away with a tin or two of M-L Floor Paint.
M-L
MAPLE LEAF
You should use M-L Pure Paint to paint anything that needs painting. It protects the surface covered better and longer than most other paints. You buy it in tins—all ready to apply. Made of guaranteed pure materials, mixed with twenty years' knowledge of paint-making for practical painters.
Think what a difference a few dimes' worth of M-L Pure Paint would make about the house. It would make some of the wood-work look like new—or a worn-bare, shabby-looking floor made spic and span as when you first walked on it with M-L Floor Paint.
PURE PAINTS
Paint the WALLS and CEILINGS with M-L Flat Wall Colors. You'll find it far easier to keep them clean and sanitary as well as brighter looking. Easiest to apply. The colors are clearer and brighter; keeps its FRESH LOOK longest. Artistic, sanitary, durable, washable and VERY economical.
M-L
M-L Is The Most Economical Paint You Can Buy
Made in forty-seven colors for every paint purpose by Imperial Varnish & Color Co., Limited, Toronto. Sold by dealers who believe in giving you your full money's worth.
For Floors Get M-L Floor Paint Dries Hardest Wears Longest
710
Ask your dealer for information and color card or drop us a card to our nearest addresses, Toronto, Winnipeg, Vancouver."

THE SIN OF OMISSION.

It isn't the thing you do my friend
But the thing you leave undone
That gives you the bitter heartache
When the work of the year is done.
When your apples are all worm eaten
And the "taters" blighted and small
When the use of a "PERFECT SPRAY PUMP"
Would have saved them one and all.

Oh, the apples, you might have had, my friend,
If you'd only sprayed the same,
"Oh, the "taters" you've thrown away, my friend,
That would have been clear gain.
These would have paid for your spray pump,
And have left you a happier man.
Then buy the best "A PERFECT,"
And save them while you can.



The "Perfect Spray Pumps"

are manufactured by

R. B. Westhaver, MAHONE BAY, Nova Scotia.

Pen No. 1—White Orpingtons, Ganong strain, New York, a classy pen of ten yearling hens and pullets, headed by the best cockerel I have seen in the Maritime Provinces, large and well shaped. One hen won $15.00 in prizes last year; look up my record. Will sell the lot for $15.00. I also have some nice chickens from them, which will win prizes for the buyer at the fall fairs. Price on application.

Pen 2—Black Orpingtons, 12 hens and one cock, the best looking, the largest and the best laying strain of blacks in the country; many prize winners among them. The cock bird alone is worth at least $7 00. One hen cost me $4.00 as a pullet and won first at Amherst last year, also one pullet won first at Amherst. Will sell the pen for $20.00. Chicks for sale on application.

Pen No. 3—Buff Orpingtons all sold.

Pen No. 4—Brown Leghorns. I have 13 hens and pullets and two cockerels. Cockerel and pullet mating. They are great layers and are good exhibition stock. Will sell at $15.00. Better buy them.

C. H. WISENER, Pictou, N. S.

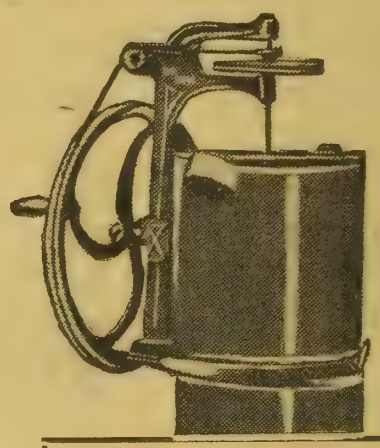
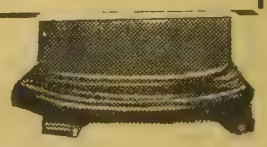
This Machine Makes Granular Butter From Sweet Whole Milk in Five Minutes.



SEPARATES Butter from Sweet, Whole Milk in Five Minutes Time



THIS machine performs the offices of both Cream Separator and churn in one operation. You simply bring your sweet whole milk to a temperature of 72 degrees, pour it into the tank, turn the handle for five minutes and you have butter. In fact, if you turn the handle hard enough you can have just as much butter and of just as good quality in half that time. It sounds marvellous, doesn't it? But once you have tried the "Only" Butter Separator you will

THROW AWAY CREAM SEPARATORS AND CHURNS

and abandon all the work they entail. You don't need to separate with a cream separator; you don't need to wash the cream separator; you don't need to wait for your cream to sour; you don't need to churn; you don't need to bother with any of these laborious processes, if you have an "Only" Butter Separator. Moreover, this machine, which has revolutionized the art of butter making, invariably produces the highest quality of granular butter from sweet or sour whole milk, sweet or sour cream, or even from milk with water added to it. And it takes out only the butter fat. When you

Use the "ONLY" Butter Separator

the skim is left with all the casein, sugar of milk and salts in it—it makes the highest type of tissue building proteid for stock feeding. Butter made with The "Only" Butter Separator, moreover, has better keeping qualities; it is made from nothing but the pure butter-fat, and has no casein in it to turn it rancid. Moreover, it requires practically no working. The "Only" Butter Separator is an economy every way you look at it; figure its cost of $38.00 against the price of a good cream separator and a good churn; figure the time saved and the superior feeding value of your skim. Then write to us for our book.

The Joshua Brown Co., LIMITED,

PEMBROKE, - - ONT.

Get Our FREE Book -The "Only" Way.

This book ought to be in the hands of every practical dairyman. It deals with old methods of butter making and explains fully how this machine, so simple that it should have been invented long ago, has revolutionized the art. It explains the exact action of The "Only" Butter Separator, tells how it gets the butter fat from fresh milk and how and why it leaves skim of superior feed value. We really ought to make a charge for this book, but as long as the edition lasts, we will send one on request. Simply clip, fill out and

Send the Coupon.

YOU Can Furnish Your Home FREE!

ANY housewife buying goods at the stores mentioned below may have their cash purchases apply on **Asepto Soap Premiums.** Every cent you spend counts toward a premium. A sure and mighty convenient way to save without increasing living expenses. Over 300 premiums of honest value to select from. The list will be increased every few weeks. Furniture will be offered next. The old way was to allow premiums to apply on Soap Wrappers only. Now at any of these stores—no matter what you buy—everything has its equivalent in Soap Wrappers. That is every five cents spent counts the same as one wrapper, while purchases of our goods as here advertised entitles you to two coupons—the one the merchant allows and the ones found in or on our goods themselves.

Dr. White's Honey Balm.—A cough syrup that is safe and sure. We are positive that no other cough syrup equals it. Price 25c. Equal to 5 soap wrappers.

Pendleton's Panacea.—The best hot medicine, in use nearly 100 years. Every person knows it is good. Price 25. Equal to 5 soap wrappers.

Brown's Cutilive.—A witch-azel cream for chapped hands, sunburn, etc. Price 25c. Equals 5 soap wrappers.

Scott's.—Salts, Senna, Sulphur, Saltpetre, Borax and Alum in 5c packages. Equal to 1 soap wrapper.

Brown's Spearmint Tooth Paste—Sweetens the breath, prevents decay, hardens the gums and whitens the teeth. Price 25c. Equals 5 soap wrappers.

Napatho Soap.—A pure laundry soap, containing naptha and incorporated by a process that prevents it from hurting the hands, as other Napatho Soaps do. The wrappers count for Premiums.

Sapid Tea.—A blend selling at 40c, in 1 lb. packages only. Blended by J. Harvey Brown, one of the most competent tea men in Canada. Each package carries a coupon equal to 8 soap wrappers.

Dr. Scott's White Liniment.—The largest bottle and best liniment. Price 25c. Equal to 5 soap wrappers.

Banner Flavoring Extracts.—All flavors and from 10c to $1.25 per bottle. Coupon on each bottle.

Herner's Dyspepsia Cure.—The only kind that tells you to eat what you like while taking it. Money back if not good. Price 35c. Equal to 7 soap wrappers. Price $1.00. Equal to 20 soap wrappers.

Brown's Stomach and Liver Pills.—A good family pill. Price 25c. Equals 5 soap wrappers.

Scott's Furniture Polish.—Renews the life of old furniture. Price 25c. Equals 5 soap wrappers.

Asepto Soap.—Is equal to the best and contains the same anti septic features that Asepto Soap Powder does. The wrappers count for premiums.

Scott's.—Nitre, Glycerine, Iodine, Iron, Squills, Friar's Balsam, Carbolated Oil, Camphorated Oil, Castor Oil, Sweet Oil, Oil of Tar, Sewing Machine Oil, Spirits of Camphor. Price 10c per bottle. Equal to 2 soap wrappers.

Scott's Fruit Syrups and Lime Juice.—Pure and excellent flavor. 10c, 15c and 25c. Coupon on the bottle.

Ebony Polishes—None better, bothpaste and lustre. Coupon on each box. Try them.

Banner Spices.—In packages only. Absolutely pure. ¼ lb. packages carry coupon equal to 2 soap wrappers.

Venus Floating Soap.—Made from pure vegetable oils and unexcelled for the toilet and bath. Price 25c. Coupon counts for premiums.

Asepto Soap Powder.—Has been the greatest success of any soap or powder ever put on the market. This is the best evidence of its quality. It is antiseptic as well. It absolutely sterilizes every article washed. Think what this means to a family. Price 5c, and the trade mark counts for premiums.

Five Roses Flour

Not Bleached — Not Blended

LAKE OF THE WOODS MILLING COMPANY, LIMITED MONTREAL

DO IT NOW.

When a man ain't got a spray pump, and is feeling kind of down,
And the pesky little insects won't let his crops alone,
It's a great thing, oh, my brethern, for a fellow just to say
Send and get a "Perfect" spray pump, and apply a coat of spray.

It makes a man feel queerish when the season's work is through,
And the taties are all rotten and the apples wormy too,
Then order up a "Perfect" and do it right away,
And spray the fruit and taties and save them while you may.

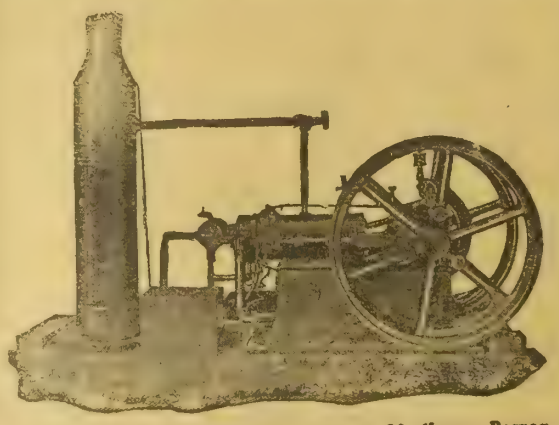
Farmers of Quality

Want Quality !



Stationary and Mounted, in 1 1-2 to 30 Horse Power

Readers of THE MARITIME FARMER are of the quality stamp; we realize their discerning ability to pick an article of machinery that is correct in every mechanical detail. That is the reason why such care is taken to see that the **Ideal Gas and Gasoline Engines** are what we claim for them.

Every part of the **"Ideal"** is interchangeable—a mighty strong feature. The cylinder, instead of being cast with the base, is cast separate and bolts on the base. The valves, instead of sealing directly on the cylinder head are enclosed in a valve cage, and the valve cage is inserted in the cylinde head, so that when the valves become worn, the valve cage andivalve can be taken out and ground without removing the cylinder head.

The idea of casting the cylinder separate from the base is a good one, for when the walls of the cylinder become worn, you don't have to buy a complete new engine, you only require a new cylinder that can be bolted on the base. Another good feature is an extremely long piston with double rings instead of using three rings. We use three sets of two rings each on the Ideal.

Another thing, there is a speed regulator on this engine which enables you to run the engine at any speed, and, of course, when you reduce the speed of the engine, you also reduce the fuel consumption. For instance, if a man had a 6 H. P engine and wanted to run a cream separator with it, he could reduce the speed and thereby cut down his fuel consumption to suit the work.

All these are points to consider when looking for a gasoline engine of quality—one that stands without a peer.

"Ideal" Gas and Gasoline Engines are built on honor and built to give their operators satisfaction, and they do it. We do not build a cheap or low grade engine, but do cater to that class of buyers who wish a first class article at a reasonable price.

THE LEADING BREEDS OF SHEEP

Their Origin, Development and Characteristics.

By B. J. Spencer, B. S. A., Ottawa.

IN compliance with the requests of a great many of our readers we will publish in serial form articles on "The Leading Breeds of Sheep." These articles were prepared by J. B. Spencer, B. S. A., Ottawa, and appeared in Bulletin No. 12, 'Sheep Husbandry in Canada,' published by the Department of Agriculture, Ottawa.

There are a great number of varieties of domestic sheep, all of which are doubtless descended from one wild form. Domestication of this class of animals commenced almost at the beginning of the human race, when the second son of Adam chose sheep herding as an employment. With the migration of the human family sheep were taken to different parts of the world and under the varying environments in which they were perpetuated they assumed characteristics and properties quite different from one another. With improvement in agricultural practice sheep as well as other farm animals were kept and developed along special lines. This going on simultaneously in different portions of Europe and Asia it was but natural that varieties of quite different characteristics would be evolved. The probability is that domesticated sheep originated through the domestication of several races in many parts of the world the peculiarities and valuable properties of each having been developed by selection, until a more or less perfect type was obtained. The crossing of species of sheep orginally distinct has no doubt still further increased the number of our recognized breeds.

The leading breeds of sheep found in Canada, with the exception of the Merino, which is kept to some extent only in the northwestern provinces, have been developed in Great Britain. They are classified as long and medium woolled, the Merino in its various forms being classed as fine-woolled.

Throughout the British Isles there is found in a state of greater or less purity more than a score of breeds, the chief of which are as follows: Black-face, Herdwick, Gray, Lonk, Devon, Longwool, Exmoor, Welsh, Cheviot, Suffolk, Leicester, Lincoln, Cotswold, Oxford, Shropshire, Hampshire, Southdown and Dorset. Of these only the last eight breeds named are at all common in Canada. A small number of Black-Faces, Suffolks and Cheviots are also to be found, but neither of these is increasing to any appreciable extent.

The Lincoln, the Leicester and the Cotswold are known as the long-wool sorts, while the Oxford, the Shropshire, the Dorset, the Hampshire and the Southdown are classed as medium-woolled, the fleece shortening in length in the order named. The fleece of the Cheviot and also of the Suffolk is medium in length, but the former is the longer of the two. These two sorts are, therefore, placed with the medium-wolled varieties.

The Leicester.

The Leicester is the oldest of the long-woolled races of sheep. It appears to have inhabited Leicestershire, England, and the adjoining counties even prior to 1660, when the districts referred to were noted for the excellent quality of their sheep, which are said to have possessed large bone, rangey frames and heavy fleeces of strong texture. They were slow to mature and to fatten. It is generally believed by authorities that the sheep found in these counties, known as the Midlands, were used by Robert Bakewell, of Dishby, as the foundation of the New Leicester or Dishley breed.

Border Leicester Ram.
Leicester Rams, imported and sold by the Nova Scotia Department of Agriculture, Scene on the College Farm, Truro, N. S.

Mr. Bakewell commenced an improvement of the sheep of his district in or about 1755. The merit of his work consisted in his realization of the fact that the properties of parents may be transmitted to their offspring until fixity of type is the result; also in his innate power of discerning by an animal's external form and 'quality' that it possessed the properties he desired to perpetuate He was able to discriminate between size and quality and had always an eye for the latter when selecting breeding animals. In order to render permanent the desired qualities of the selected stock he resorted to in-and-in breeding to an almost incestuous degree. The qualities sought by Bakewell were greater symmetry of form, improved qualities of fattening, and an earlier maturity, a reduction in the proportion of bone and of fat, and a greater development of the parts of the carcass of most value on the block. These characteristics were undoubtedly secured, but others of great importance were to some extent overlooked; these were strength of constitution, prolificacy, as well as quantity and quality of fleece. The breeders of Leicesters in later years have overcome these defects.

It is recognized that no other breed possesses a greater expansion of heart girth than the Leicester. Nor is prolificacy lacking in the present day Leicester, as triplets are of frequent occurrence, and from 150 to 175 per cent of increase is not uncommon in well kept flocks. Whatever weaknesses marked the fleeces of Leicesters in Bakewell's time these have long since been overcome in well kept flocks. As a rule good specimens are thoroughly covered in all parts except head and legs; length and density are also present in a high degree, while the wool of no other breed excels in lustre.

In order to extend the blood of the improved atock as rapidly as possible, Mr. Bakewell instituted a system of hiring rams of his flock for the breeding season to farmers in the district. During the first year or two farmers were slow to take advantage of the use of the improved sheep, and all Mr. Bakewell could get for the season's use of rams was some 17 shillings and 6 pence each, but the improvement effected by these crosses was so evident that in a few years the demand for the sheep became so keen that the price rose to one hundred guineas per head, and in a single season, 1789, it is said that six thousand guineas were obtained for the services of Bakewell rams.

The Leicester sheep as it came from the hands of Mr. Bakewell, near

the end of the eighteenth century, is described as a white faced, hornless race of excellent mutton sheep with short thick neck, wide level back, thick deep chest, deep quarters and fine bone and bearing a fleece measuring about seven or eight inches in length of somewhat lashy wool, but terminating with a short twisted curl.

About the time of Bakewell's death one George Culley commenced using Leicester rams from Dishley on the Teeswater breed, which was at that time in high favor as a long-woolled sheep. The stock evolved from this cross is believed to have been the foundation of the Border Leicester, although on account of the proximity of the home of the Cheviot it is not unreasonable to suppose that in the early years of the Leicester the blood of its white-faced neighbor entered into many of the best flocks. Border Leicester rams soon became as popular as Bakewell's had been, as much as one hundred guineas being paid far the use of a single animal for a season. From that time until the present the Border Leicester has stood in high favor as a mutton and wool producing breed. The Bakewell Leicester, later becoming known as the English Leicester, was perpetuated in its pure state and is to-day raised in large numbers in Great Britain and in other countries.

The difference between the English Leicester and the Border Leicester is seen in the head, which in the Border variety is white, and boldly carried, the nose slightly aquiline, the muzzle full, the nostrils wide and the ears erect. The head is clean and free from wool. The English Leicester usually carries a tuft of wool on the head and it is also woolled on the shanks. The English Leicester has a bluish-white face, whereas the Border Leicester's face is clear white. In carcass the Border Leicester is larger and longer and the belly is not quite so full in outline, being carried rather more highly.

No other race of sheep has been so largely employed as a means of improving other breeds as the Leicester the Cotswold, the Lincoln, the Shropshire and the Hampshire and many others directly or indirectly have through its blood been improved.

Canadian Leicesters are among the best of the Leicester family. Nowhere in the world are finer specimens to be found. This is largely due to the fact that until recent years the American demand for Canadian Leicesters has not been strong and the Canadian breeders have retained in their flocks the best of each year's crop of lambs. By selection and careful weeding many good flocks have been built up. The excellence of the Leicester proves conclusively that if the Canadian breeders of other breeds of sheep would follow the same practice the Canadian flocks of all sorts would equal or excel those to be found elsewhere.

The characteristics of the Leicester should, like all mutton breeds, conform in a general way to the standard for mutton sheep appearing in the first part of this work. The Leicester is one of the large breeds, the average weight for mature rams in good flesh being 250 to 300 pounds and for ewes 175 to 200 pounds.

The head is small for the size of the body and is carried with pronounced erctness and stateliness. The nose is slightly Roman in rams but almost straight in ewes. The ear is thin, moderately long and carried decidedly erect and alert. The head and legs are snowy white in young animals but becomes darker with age.

The Leicester is classed among the long-woolled breeds; its fleece, however, is of somewhat less length than that of the Cotswold or the Lincoln. The wool is glossy and of good fibre and should cover the entire carcass save the head and legs, although a small amount of quite short wool on the forehead and the shanks is allowable. The wool of this breed hangs in dense spirals which carry their crimp or wave to the skin; the fleece should consist of a mass of distinct curls all over the body and without the parting at the back as in some other long-woolled breeds.

Weeds in Mill Feeds.

Under the authority of an Order of His Excellency in Council, bearing date the first day of May instant, paragraphs 13, 14 and 15 of the Order in Council of the 29th October, 1910, establishing standards of quality for grain products, have been cancelled and the following substituted in lieu thereof:—

13. Bran is a product of the milling of wheat or other grains, and contains not less than fourteen (14) per cent of proteids, not less than three (3) per cent of fat, not more than ten (10) per cent of crude fibre and must be free from vital seeds of any of the noxious weeds defined by the Governor in Council under "The Seed Control Act."

14. Shorts or Middlings is the coarser material sifted out from the products of a second treatment of the grain by crushing the coarsely ground material that is sifted out from the bran after the first grinding; and contains not less than fifteen (15) per cent of proteids, not less than four (4) per cent of fat, not more than eight (8) per cent of crude fibre and must be free from vital seeds of any of the noxious weeds defined by the Governor in Council under "The Seed Control Act."

15. Chop-Feed is whole grain of one or more kinds more or less finely ground, and contains not less than ten (10) per cent of proteids, not less than two (2) per cent of fat, not more than ten (10) per cent of crude fibre and must be free from vital seeds of any of the noxious weeds defined by the Governor in Council under "The Seed Control Act."

These amended standards will come into force on the seventh day of June proximo.

The amendments are in accordance with recommendations made by the Seed Commissioner and are based on the results of three years investigation. During the early spring months, while inspecting seed, the official inspectors collected samples of bran, shorts, crushed or ground feed and feed oats from lots offered in the retail trade. These samples represented feeding stuffs manufactured and sold by wholesale distributors in all parts of Canada. The average number of weed seeds per pound in the samples collected in the spring of 1910 was as follows:—

For bran, shorts and middlings, 246.

For crushed grains, 677.

For ground meal of various sorts, 1,802.

For feed oats, unground, 4,022.

The whole weed seeds found included more than fifty species of plants that are commonly troublesome as weeds. It is definitely known that when consumed by farm stock, even, to a limited extent, by sheep and poultry, a proportion of such weed seeds pass into the farmyard manure with the vitality unimpaired. The kinds of impurities found in most of the samples produced in Eastern Canada make it clear that they originated in the cereal crops of the prairie provinces. Investigations at Port Arthur, Fort William and at Winnipeg, reveal the fact that about 1,500,000 bushels of screenings and refuse were last year cleaned out of wheat and barley at the terminal elevators. Of this amount only 51 carloads were distributed in Canada, of which only three carloads were shipped east of Montreal.

The cheaper grades of oats are not cleaned at the terminal elevators. Practically no exporting countries clean the feed oats they market. The cost of cleaning them; plus the waste, is greater than the increased market value. Western Canada feed oats are the cheapest horse feed available in central Canada and large quantities are fed, unground, in cities and towns, particularly in Ontario. The cheapest grades are blended with screenings or other coarse grains, then crushed and ground and retailed for cattle or hog feed.

Feed oats and screenings would have to be ground quite as fine as shorts, in order to destroy all the weed seeds, and the product, especially for cattle, is less acceptable than the coarser ground meals. A great deal of the ground feed in Ontario is now prepared in small custom choppers. During the slack season, the owner of the chopper, who is commonly the operator, buys feed oats and screenings in single carlots and from them prepares stock feeds for sale. These steel plate choppers are not able to destroy all the weed seeds.

Flour mills are equipped with machinery for cleaning wheat before milling it. The cleanings thus removed are as a rule crushed and mixed with other mill offal. The mill sweepings are usually mixed with the bran or mill feeds. The process of crushing in many small flour mills does not destroy the vitality of the smaller weed seeds. The large flour mills do not mix the cleanings with their bran and shorts.

Complaints from agricultural organizations and farmers respecting weed seeds in feeding stuffs have arisen principally in Ontario, which province, on account of its live stock interests, shares more than any other in the benefits as well as in the evils that accrue from cheap feeding stuff naturally accumulating in the large terminal elevators. The regulations now in force will protect farmers who want to protect themselves from using feeding stuffs polluted with weed seeds and thus unwittingly distributing noxious weed seeds on their land. The presence of weed seeds in unground grain is not difficult to detect.

Sulphate of Ammonia.

The prize essay on Sulphate of Ammonia and use of same in Agriculture by James Muir, M. R. A. C., formerly professor at Royal Agricultural College; after an extensive review of the subject and on searching analysis of various practical experiments sums up the utility of Sulphate of Ammonia to the farm as follows:—

SUMMARY.

1. Sulphate of Ammonia is a nitrogenous manure and must be considered as a source of nitrogen only.

2. Nine other elements besides nitrogen are essential for the plant growth of which phosphates and potash, as well as nitrogen, must usually be supplied in the manure.

3. Combined nitrogen only can be used by plants.

4. Combined Nitrogen in nature is supplied to the soil only in small quantities, and is subject to constant loss. The addition of nitrogenous manures is therefore needed.

5. Nitrogenous manures cause larger leaf growth, increased chlorophyll formation, slower maturity, and increased crops generally.

6. Organic nitrogen is of no direct use to the plant. Nitric and ammoniacal nitrogen are both directly useful, though the latter almost alwayts undergoes nitrification before use.

7. Ammonical manures generally fail to give their maximum result unless potash is liberally supplied by soil or manure.

8. Sulphate of ammonia reacts in the soil with carbonate of lime, and carbonate of ammonia is formed which can the be fixed by the clay and humus of the soil.

9. Nitrogen may be lost by the volatilization of carbonate of ammonia when sulphate of ammonia has been applied to very calcareous soils; but this is rarely important.

10. Nitrification of ammonia compounds, especially sulphate of ammonia may be very rapid when every thing is favorable. It is more rapid than the nitrification of organic mattrogenous mateer.

11. After nitrification the nitrogen is subject to loss by drainage.

12. Sulphate of ammonia is most effective in wet climates and seasons.

A small dressing of sulphate of ammonia may be applied to autumn sown crops in autumn, but most of it should be put on in the spring. For all other crops, it should be used at or a little before the time of sowing the seed. If applied late in the growth of the crop, sulphate of ammonia may cause too great rankness.

14. Sulphate of ammonia may be applied longer before sowing on heavy land than on light. It is less suitable for very calcareous soils than for either sandy or clay soils, and still less so for soils deficient in lime.

15. Sulphate of ammonia may leave a valuable residue in the soil after the removal of the crop to which it is applied.

16. Too large a dressing of sulphate of ammonia causes injury from over-rankness of growth and late maturity, especially if mineral plant food be deficient in the soil.

17. Sulphate of ammonia should be mixed with dry ashes, sand, etc., for convenience of sowing or with other manures, except those which contain lime or carbonate of lime, or which are damp.

18. Commercial sulphate of ammonia should be of 95 to 97 per cent. purity, containing about 24 to 25 per cent of ammonia. The chief impurities apart from sandy matter, are common salt, sulphate of soda, sulphate or iron, arsenic, sulphuric acid, and thiocyante of ammonia of which the last three are most injurious.

19. On wheat, sulphate of ammonia increases the quantity of the produce, and improves its quality. About 1 cwt. per acre should be given.

20. On barley, sulphate of ammonia gives large increase, and on the average produces a better malting sample than other nitrogenous manures. Average dressing ¾ cwt. to 1 cwt. per acre.

21. On oats, sulphate of ammonia usually yields a larger increase of grain than nitrate of soda, and of straw also if potash be very plentifully supplied. Average dressing about 1 cwt. per acre.

22. On mangels, when farmyard manure is used, sulphate of ammonia is probably superior to nitrate of soda in produce per acre of food for stock, and often in weight of crop. Without farmyard manure, it has rather less effect. Average dressing 1 to 2 cwt. per acre.

23. On turnips sulphate of ammonia compares favorably with ni-

trates, giving as large or larger crops which apparently keep better. Average dressing about 1 cwt. per acre.

4. On potatoes sulphate of ammonia gives very large increase—almost always larger than that from nitrate of soda. Sulphate is also less favorable to the development of disease. Average dressing, 1 to 2 cwt. per acre.

25. On beans, sulphate of ammonia does not give any profitable result.

26. On clover sulphate of ammonia, is as effective as other nitrogenous manures, but it is rarely profitable.

27. On grass land, sulphate of ammonia produces a yield in weight about equal to, or slightly less than nitrate of soda. It specially encourages the grasses at the expense of the clovers. The produce seems to be more palatable to stock than that of nitrate of soda, and to have a high feeding value. Average dressing 1 to 1½ cwt. per acre.

Note.—In the above summary all comparisons between sulphate of ammonia and nitrate of soda are between equal quantities of nitrogen in the two forms. This is equivalent to comparing the effect of a little over ¾ cwt. of sulphate with that of 1 cwt. of nitrate.

The Pictou and Antigonish Counties Picnic to the Agricultural College, Truro, N. S.

The annual farmer's picnic for Pictou and Antigonish Counties was held at the Agricultural College, Truro, N. S., on Thursday, June 29th, 1911. Two special trains, bringing over 1200 farmers, arrived at 10.00 o'clock, a. m. The weather conditions for the day were all that could be desired. No official programme for the farmers took place until 1.30 p. m., but during the remainder of the morning all the various departments of the college and farm were visited and much interest shown. At 1.30 p. m., on the lawn in front of the main college building, a formal programme was given, consisting of speeches by Messrs. C.E. Tann, R. H. MacKay, M.P.P., R. H. MacGreg M.P.P., R. H. Kennedy, M. P. P., and Col. Wm. Blair. Intersperced with the speeches was a display with explanation, of cattle and horses. This consisted of representative herds of the various dairy and beef breeds, together with four breeds of horses, as repre-

MEAT INSPECTION.

A recent circular issued by J.G. Rutherford, the Veterinary Director General and Live Stock Commissioner for the Dominion of Canada, contains a great deal of "meaty" information in its five pages. Mr. Rutherford states that up to the present time the Meat and Canned Foods Act has in too many cases remained a dead letter or at the best has been very ineffectively enforced. This, he states, is not the fault of the federal authorities, however, because it is an utter impossibility for any federal department to supervise in all its ramifications the local meat trade in every town and village throughout the Dominion. Mr. Rutherford believes it possible for municipalities to organize at but little cost a thoroughly effective system of local meat inspection. He is satisfied that once the Canadian public becomes familiar with the situation they will insist upon the adoption by the various municipal authorities throughout the country of a much more thorough system of dealing with butchers and the meat trade generally than has heretofore been tolerated.

The first and most important step in this direction, declares Mr. Rutherford, will, it is needless to say, be the providing of public municipal abattoirs to be conducted under inspection methods similar to those required by the Meat and Canned Foods Act, established as regards the admission of live animals or carcasses. The sooner the private slaughter houses are abolished altogether, Mr. Rutherford asserts, the better for all concerned, as most of the objectional meats placed on the markets emanate from those undesirable and unsanitary places. Trade in home killed dressed carcasses will also, for similar reasons, gradually be wiped out of existence, and although the abolition of this form of meat disposal will probably cause some temporary dissatisfaction among farmers, matters will soon adjust themselves, and the profits of the producer will be in no way lessened, although the livers and other offal hitherto utilized by the household, will be no longer available.

"The municipal abattoir is a modern necessity, and must come," continues Mr. Rutherford. "There are many among us not yet old who can well recollect when the number of hospitals in Canada could almost be counted on the fingers, and when a proposal to erect an institution of this kind in a small town was looked upon as indicating a mild form of insanity. How many of the communities now possessing modern and up-to-date hospitals would be satisfied to do without them? The same will be found true of the abattoir, and if no other argument can be advanced in favor of the Meat and Canned Foods Act than the fact that it has aroused and is arousing public opinion on the great and important question of a sanitary meat supply, this would, in my opinion, fully justify its being placed on the statue books."

Mr. Rutherford submits a table showing the number of carcasses and portions of carcasses, condemned by the Dominion meat inspectors from April 1, 1909 to March 31, 1910. Carcasses to the number of 7,624 were condemned and the official ban was placed 324,434 portions. Of the total number of carcasses condemned, 3,487 were infected with tuberculosis, and the same disease was found in 218,056 portions out of the total of 324,434. These figures are very significant, indicating as they do the need of the tuberculin test. Immaturity resulted in the condemnation of 2,029 carcasses; pyemia accounted for 333; bruises for 256; pneumonia for 196; and emaciation for 181. It is not pleasant to reflect that 50 per cent. of the meat condemned by the government inspectors was tainted with tuberculosis. It shows the need of more thorough inspection and cleaner herds. The farmer who kills a beef has a pretty fair idea of the animal's health, and so far as observation goes, very little, if any diseased meat is marketed by the farmers, prejudiced reports to the contrary notwithstanding. It is the irresponsible slaughterer who picks up cast off beeves that needs to be watched. The time is coming when meat that does not bear the inspector's stamp of approval cannot be sold. The system will be difficult to introduce as it seems silly to assert that a man should not be allowed to sell a pound of beef that he raised himself without having it inspected. The remedy lies in the municipal abattoir where every farmer can send his cattle and have them butchered. Then every pound of beef can be properly inspected and the public afforded protection.

DAIRY RECORD CENTRES.

The new extension work of the Dairy Division, Ottawa, is causing many enquiries to be made. For the benefit of our readers it may be explained that officials are now located in Peterboro, Lanark and Oxford counties, Ontario; St. Hyacinthe and Brome, Quebec; and at Kensington, P. E. I., with a view of gathering specific information as to the exact standing of the dairying industry in the district: each such district is termed a dairy record centre. Each farmer within a certain area will be called on, and there will be obtained from him a statement as to the number of acres cultivated and in pasture, the number of cows, the type of sire, the weight of milk sent to the factory, the milk used at home, the cost of feed, and so on. When these statements are compiled there will be definite and valuable information for the encouragement of other dairymen. It is intended to follow up this work closely for some years, both in these and other sections.

The recorders are paying special attention to the encouragement of cow testing in these districts; they are already collecting weights and tests of about four thousand cows, so that it is evident that a tremendous impetus is being given to cow testing by this new forward movement.

A special bulletin on cow testing is available to all applicants. Forms for recording weights of milk are supplied free by the Dairy Commissioner, Ottawa. When applying, state the number of cows, and whether forms are wanted for weighing daily or on only three days each month.

VARIATION IN YIELD OF PLANTS.

Some interesting experiments have just been made public by the horticulturist of the Experiment Farms at Ottawa, relative to the bearing record of apple trees. This report is a result of a study covering a period of years and shows wide variation within varieties.

It was found in keeping notes on the Wealthy that of the 17 trees, the best tree produced practically five times as much fruit as the poorest and about twice as much as the average for that variety. Five trees out of 17 were designated as productive and 12 were relatively unproductive.

The McMahan White was subjected to rigid inquiry and it faired no better than the Wealthy. In 11 years one tree yielded 94 bushels of apples, while another nearby produced but 20. No other tree recorded more than 75 bushels during this period and the average was much less.

Two trees of McIntosh were compared for 10 years and the results showed that one produced twice as much as the other. Several trees of other varieties, among them Patten Greening, were likewise compared and it was found that one tree of the Greening produced 60 bushels, while another yielded but 30, the average being 40.

These experiments show what many of us have found by experience, that there is a wide variation in the yield of trees. The only way to determine the bearing qualities of fruit trees is to keep a record for a number of years. When this is done it will usually be found that many trees are kept at a loss and are not worth space in the orchard.

Think of the possibilities of propagating from trees with good bearing records. Take the record of the Wealthy given above. Had all the orchard been propagated from trees that gave the yield of this particular tree, the orchard would have given a much larger net income. It required as much care and attention, except perhaps gathering the fruit, to care for the tree that produced 63 bushels as for the tree that yielded but 30.

Enough attention has not been given to seed selection and plant breeding. The possibilities for increasing the yield and the quality of crops by systematic selection have not been generally appreciated. Indiscriminate propagation is impoverishing our orchardists and poor seed is bankrupting our planters. If you do not believe this, examine your crop and note the unproductive plants.

Animal husbandmen are careful about the pedigree of their stock. They demand that both sire and dam have have a record that will commend the offspring. But farmers and fruit growers have not given enough attention to the quality and potentiality of seeds and plants. As a result of this, the average yield of staple crops is very low.

EDITORIAL NOTES.

When the general good of a community or an organization is spoiled, there is not much longer any individual good in it worth having. The most ambitious and selfish individual, sharing large interests, however humbly, should keep a jealous eye upon the general good; for though he may not realize it, all his hopes rest on the preservation and promotion of that.

The value of the farm is greatly increased by the size and quality of the orchard. Every farm where it is possible to grow fruits should have an orchard at least for home use. Many farms would be more profitable to the owner if an orchard is maintained large enough for market purposes.

How Can Alfalfa Growing Receive a Boost in the Maritime Provinces?

Feeding of Alfalfa.

I will not say much about feeding, as the majority are very likely to say "no one need to teach me how to feed a cow;" but I know there are a great many dairy farmers that do not know how to feed a dairy cow a balanced ration. The cow, as I would describe it, is a living separator which separates the milk out of the feed.

Therefore, the feed must first contain the milk. Every dairyman should first know what substances the milk contains, also what substances the different feeds contain, then he can easily figure out how much it requires for each food to produce a certain quantity of milk. Many farmers are feeding their cows corn fodder and timothy hay, which are rich in carbohydrates and fat, but very low in protein, then wonder why their cows do not produce more milk.

Mostly all forage plants are not rich enough in protein, therefore alfalfa is so valuable to make up a balanced ration. One acre of alfalfa produces as much protein as nine acres of timothy. In winter I feed my cows 10 lbs. of shredded corn fodder, 10 lbs. of alfalfa and 9 lbs. of corn chop—29 lbs. per day. This is nearly a balanced ration, and I receive from 25 to 28 lbs. of milk per cow per day. During the last year I received from the factory and veal calves $115.41 per cow.

A year ago last summer I decided to find out which was the most successful way to grow alfalfa. So I went from one farmer to another through our vicinity, until I had a full description of 74 fields. I found 34 fields sown in April, from 17 of which no stand resulted and they had to be plowed up again; 29 were sown in May, only one of which afforded a poor stand; 10 sown in June, all of which had good stands; one sown in August came up fine, but was winter killed.

I would say many farmers are making a mistake by sowing the seed early, or a too heavy nurse crop. I found some good stands on limestone, clay, and concrete gravel subsoil. After the soil is inoculated the young plants will thrive better and can stand more drough, therefore it is easier to get a good stand. Many farmers claim the second and taird crops as the best for milk. That is true enough, but the reason is they let the first crop stand about two weeks too long, until it is old, coarse and leafless. By cutting it the first days of June and every four weeks after, they could easily harvest four crops in a season, which will make a fin? feed for cows, horses, sheep and swine.—John Waelti, Wisconsin.

Is Alfalfa Profitable.

A farmer of Peterborough county sowed alfalfa on a field that was practically sand and gravel and got a fine crop last year. Previous to this the same field barely paid for the cost of cultivating. me states in an interview that the alfalfa was the only paying crop he got from the field in years.

A Peterborough dairyman states that last summer he fed his cows two gallons of wheat bran each day but as soon as the alfalfa hay was available he stopped feeding the bran and replaced it with alfalfa hay. The cows immediately increased in their flow of milk on the alfalfa feed.

Alfalfa, grown according to the latest scientific rules can be placed in the barn at $2 per ton. It contains 11 per cent. of protein while wheat bran costing $23 per ton, contains only 12 per cent.

Alfalfa in Oaklahoma.

In 1902 F. S. Kirk, of Garfield county, Oklahoma, sowed a field near a creek, but about 25 feet above water, with 30 to 35 pounds of alfalfa seed per acre, broadcast. The soil, which he calls "high bottom" was a dark brown and contained considerable sand. For two years no attention was given the alfalfa except harvesting from it three crops the second year and four the third year. In 1905 he harvested from ten acres nine cuttings, estimated to weigh fully one and one-half tons each, per acre. The longest time between any two cuttings was twenty-two days; and the shortest fourteen days. During the season of 1904 seven cuttings were made and the field was gone over with a disk harrow early each time after removing the hay. It was possible to cut another growth of eight to 12 inches, had he not preferred to use it as pasture.—"The Book of Alfalfa."

Handling Soil for Alfalfa.

I prepared land for alfalfa last year and got some seed at the state college. Through a delay of express company seed came too late to sow. I put on a ton of lime and seeded to rye last fall. How should it be handled this year and will seed be good.—D. Eddie, Massachusetts.

The probability is that the seed furnished him last year, which we believe to have been of unusually fine quality, will germinate this year nearly as well as last. I advise turning the rye under when in bloom, applying the basic slag meal and potash as was advised last year, if this was not done at that time, harrowing repeatedly until about the last of July in order (5) to somewhat consolidate the soil, and (2) to kill any annual weeds which may start. I should sow the alfalfa when the moisture conditions are such as to favor quick germination, some time between July 25 and August 5. But just before sowing the seed I would apply fertilizers as recommended last year. As the best means of making clear to readers what was recommended last year I give outline directions, which were furnished to all experimenters.

What Method to Follow.

Select a small piece of land, one-fourth acre or more, which is naturally thoroughly underdrained. The surface also should slope gradually as standing water or ice will soon kill out the alfalfa. A moderately heavy soil is probably the best, but you will have to use whatever soil you have on your farm, provided it meets the requirements as to drainage. It would be well to select a piece which was plowed last fall, but if this is impossible, plow now as soon as possible.

To the rough furrow apply about 1½ tons lime per acre. If you do not have a supply of agricultural building lime by the barrel for this lime on hand, I would get sufficient small piece and spread it in piles on the plowed surface and add water enough to slack it until it changes to a fine dry powder, then spread it evenly and harrow in deeply with wheel harrow. Keep the piece harrowed at intervals of about two weeks to destroy weeds and about June 20 apply per acre: grade sulphate of potash, 350 lbs. Basic slag meal, 1200 pounds; high If you cannot get these materials apply about one ton per acre of some ready mixed fertilizer rich in acid phosphate and potash. Harrow the fertilizer in well and keep harrowed at intervals until seeding time.

Just before seeding time apply per acre the following fertilizers: Nitrate of soda, 125 lbs.; basic slag meal 300 pounds. If you cannot get these materials, apply 100 or 500 pounds of a ready mixed fertilizer rich in nitrogen. Harrow well until you have a good seed bed. After sowing the seed it should be scratched in lightly with a weeder or similar tool and rolled. What growth the alfalfa makes this season should be left uncut as mulch for protection next winter, as alfalfa sometimes badly winterkills.—Prof. Brooks of Mass. Agricultural College.

Alfalfa Seed on Well Tilled Land will keep Canada Thistle in Check.

Canada thistles have been completely eradicated where good stands of alfalfa were secured and maintained for three years or more. For the best results the land should be heavily manured and plowed as early in summer or fall as possible, and intensively cultivated until late in May. The seed bed should then be prepared very carefully and alfalfa seed sown at the rate of 25 pounds to the acre.

The preceding treatment will have weakened the weeds. The manure will give the alfalfa a good start, and provide rapid growth so that the alfalfa will soon shade the ground enough to prevent the thistles from growing. A sod method may be used to good advantage, consisting of the seeding down to perennial grasses, such as Kentucky Blue, Red Top, English Rye grass, etc. In this case the stand must be almost perfect and the land allowed to remain in grass for a series of years. For the average farmer the first method is to be advocated.

The danger from the encroachment of this weed is very real and imminent. Farmers cannot afford to ignore the danger. Land is too valuable in this country to permit 20 per cent. of its productive power to be destroyed by woods. Steps should be taken to rid the soil of the roots as well as the seed, and the fact that Canada thistles and many other prolific weeds can be eradicated should be an incentive to the average farmer.

Much Alfalfa Sown.

The Dominion Experimental Farm at Indian Head has already shipped out this spring 26 tons of inoculated alfalfa soil. This soil has been distributed in 100 lb. sacks, and between five and six hundred occupants have been supplied with soil this year. Each sack is considered to have enough soil to sow, under careful management, one acre, so that the figures point to the fact that between five and six hundred acre plots will be distributed throughout the province of Saskatchewan. These figures, of course, are only in reference to beginners, as anyone who has grown the crop before will use soil from his own field to inoculate new patches. When it is remembered that all the experienced farmers in the West are distributing samples of inoculated soil, and that farmers are securing soil from their neighbors, who have grown the crop previously, the hold that this crop is getting on the West can be easily imagined. This work should be encouraged by everyone, as there is little doubt but that the crop can be grown in all districts of the West under careful management, and it is certainly one of the best, if not the best, paying fodder crop to grow, especially in dairy sections.

Lime For Alfalfa.

When the soil is acid, alfalfa will not succeed well until the acidity has been corrected by the application of lime in some form. The acidity of the soil may be determined by testing the moist soil with blue litmus paper, or samples of soil may be sent to the Experiment Station for testing. The ordinary tests, however, are not always decisive, and, when in doubt as to whether soil needs lime, it will usually be best to make a trial by applying lime to a small area in the field to be seeded to alfalfa, leaving strips untreated, and note results.

A good plan in liming soil for alfalfa is to plow the field several weeks or months before the alfalfa is to be seeded, scatter the lime soon after plowing and mix it with the surface soil by harrowing or discing and continue the discing or harrowing at intervals until the time of seeding. It is usual to apply from 1,000 to 2,000 pounds every four or five years where lime is used as a fertilizer. From the work at the Illinois Experiment Station, it seems that ground limestone has much the same effect when applied to the soil as lime itself. The action of the ground limestone is not so rapid, and it must be applied in greater quantity: at least two or three times as much ground limestone as would ordinarily be used of quicklime or air-slacked lime.

Alfalfa Gives Bright Yolks.

It has often been noticed by poultrymen that the yolks of eggs laid during the winter months are not as well colored as those laid in summer. It was believed by some that this was due to a lack of green food, and, in order to test the correctness of this belief, a series of experiments were carried on at the Utah Experiment Station by Prof. James Dryden, now of the Oregon Agricultural College, during the winter of 1904. The fowls in the test were divided into a number of different pens, being fed several different rations, some with corn as the principal grain and others with wheat as the main part of the ration, but all being fed sugar beets as a source of green food. The corn fed was a mixture of white and yellow, the white predominating, but did not seem to affect the color of the yolk, as all the pens at the beginning of the experiment were laying eggs with a pale yolk.

Gradually, dry alfalfa leaves were added to the food of several of the pens in addition to the ration they were already getting, including the sugar-beets. Two weeks after the alfalfa was first fed, a test for color was made, and the yolks from the alfalfa-fed pens were found to have a uniformly rich color, while those from the other pens which were fed no alfalfa, continued to be very pale in color. One pen was fed skim-milk in place of meat-scraps, but this did not seem to affect the color of the yolk. The results of this test show that it is not merely a matter of having plenty of green food, but of having plenty of the right kind of green food, if a bright colored yolk is desired.

HORTICULTURE

Why Thinning Apples Pays

There is no trouble these days in securing plenty of detailed information about improved orchard methods in New England. Reports of various agricultural organizations, including the agricultural colleges, provide liberal references to the different phases of the industry. An example is a special set of bulletins recently issued by the Connecticut agricultural experiment station at Storrs. The author is C. J. Jarvis and the title of the series is Apple growing in New England. Bulletin No. 66 constitutes the fourth in this orchard series; No. 61 discussed in a general way the status of the industry, also the renovation of old orchards. Another one considered the subject of starting young orchards. The bulletin, now being mailed, takes up the fourth and final paper of the series, discussing various phases of orchard management. It considers cultural methods, soil management, pruning, spraying, etc.

One topic considered is whether or not it pays to thin apples. Many apple trees have a tendency to overbear and different fruit growers have proved within recent years that it pays to remove half, or even two-thirds of the apples on heavily loaded trees. Surplus apples may be regarded as weeds. They are not of much value in themselves and restrict the growth of others. Thinning does not necessarily reduce the yield, but on the contrary greatly increases the yield of first-grade fruit.

There is a great drain on the vitality of the tree in the maturing of so many individuals. Each apple has its supply of seeds, and these form the most concentrated part of the fruit. By removing half the apples from the tree just that much relief is provided. This relief during the growing season allows fruit buds to form for the following year. Many growers say that systematic thinning goes a long way toward annual bearing. Then the thinning of apples lessens the loss from breaking the limbs.

The common objection to thinning is the time required. Prof. Jarvis says there is no such an argument, as there are only a certain number of apples to be picked, and it costs no more to pick them in June than in October. In fact, it is much easier to do the work at thinning time, as the fruit may be simply thrown upon the ground and raked up. A good man can thin eight to ten good sized trees in a day.

The work of thinning should begin the latter part of June or early July. Defective and wormy specimens are first removed. Sometimes the thinner carries a bag over his shoulder for the wormy apples, but this is not necessary if all the thinned apples are raked up and destroyed. The thinner next relieves the crowded. As a general rule, no more than one apple should be left on a single fruit spur, and those on the tips of branches usually should be removed, as they seldom make first-grade fruit. The results should be that the remaining apples are about 6 inches apart. Small sized varieties may be left closer, and large growing sorts should have even more room. Some varieties seldom need thinning, and there are others that habitually overbear.

Do not Injure Your Fruit or Foliage with Cheap Arsenate or Lead

Arsenical injury may appear before the fruit is harvested, depending upon the season, but in most cases it becomes apparent only after the apples have been packed and have remained in storage for a short time.

The small quantities of an arsenical in solution will tend to produce a reddish color in fruits is well known. This fact has been shown by experiments with peaches, the results being that the sprayed fruit showed a very high color externally, and, besides, the flesh was even a deep red as far as the pit. It has also been shown that the maturity of the fruit was hastened by the spray. An amount of soluble arsenic above what would produce this intense color caused burning of the fruit. In the apple, as has been indicated above, we have found approximately the same gradations of injury, from the red coloration to the burned appearance.

Knowing that the apples will absorb arsenic in a soluble form, the efforts of manufacturers of lead arsenate should be toward producing a compound not only with the least amount of soluble arsenic present, but so made that any soluble sulphides, chlorides or carbonates in the water used to apply it will not cause the arsenic to go into solution.

It is a common mistake with most growers to select that brand of Arsenate of Lead which contains the largest percentage of arsenate, no matter what the water contents may be. It must be understood by both grower and the manufacturer that it is not the excessive percentage of arsenic that are wanted but rather a timely and proper application of this important insecticide correctly compounded. Personally I would rather use another arsenate containing 12 per cent. of arsenic oride than one having three or four per cent. more. I would be just as sure of results in controlling the Moth and at the same time would feel safe that no injury would result.—P. J. O'Gara.

The Cabbage Aphis.

Two years ago the gray plant-louse which attacks cabbages, cauliflower, turnip and similar plants, just about ruined these crops in some neighborhoods. Fortunately, this is one of the pests that comes in destructive numbers only once in a number of years. Its own parasites and other enemies usually keep it fairly well in check. Sometimes it gets away from them, and when it is given a good chance, in a favorable season, it multiplies at an enormously rapid rate, and heroic measures must be resorted to to keep it under control. Its parasites and other enemies will then take care of the balance.

The commercial cabbage grower, who must count more closely than the ordinary gardener, may spray his fields with whale-oil or fish-oil soap solutions, the latter being probably the cheapest. For us, who raise cabbages and similar crops only on a home garden or small market garden scale, the easiest way to get out of the trouble is probably by spraying with tobacco-extract, such as "black-leaf tobacco extract." This is reduced one to sixty or sixty-five, with about a pound of hard soap (dissolved in water) added to every fifty or sixty gallons.

This addition is necessary to make the solution spread over the leaves. Otherwise it would roll off the leaves as water off a duck's back. The application can be nicely made with a knapsack sprayer, or with a compressed-air sprayer, but should be very thorough. I try to reach into the heart of the plant, and on the underside and everywhere possible. This enemy may not come on in destructive numbers this year, but better be prepared for its coming.—Farm and Home.

Fertilizers for Fruit Growers

Regarding the influence of fertilzers on quality and flavor of fruit, experiments seem to show than an abundance of phosphoric acid and potash in the food and plant is extremely important, and that, on the other hand, where nitrogen is somewhat deficient the effect on the quality is scarcely perceptible. Considerable work has been done in determining the influence of the several ingredients, that is, the nitrogen, potash and phosphoric acid on the size of individual fruits. With core and stone fruits the experiments are not far enough advanced to warrant definite conclusions, but with berries a greater number of results have been obtained, and these appear to indicate that the lack of phosphoric acid did not materially decrease the size of the berries, as compared with those grown where a complete mixture of fertilizers was used, but when potash was not supplied, the berries were small, and where nitrogen was left out they were still small.

Was So Nervous Could Not Stay In The House Alone

Mrs. Arthur Moore, Freeport, N.S., writes:—"I would recommend Milburn's Heart and Nerve Pills to anyone who is weak, run down and their nerves all unstrung. I was troubled with nervousness of the very worst kind, and when I started in to take your pills, I was so bad I could not stay in the house alone, nor could I sleep nights. Since taking the pills I am entirely cured and can recommend them to anyone who is nervous and run down."

To any of those suffering in any way from any derangement of the heart or nerves, we can recommend our MILBURN'S HEART AND NERVE PILLS with the greatest confidence.

They have been tried and proved, for the last twenty years, to be exactly what we claim for them.

Price 50 cents per box or 3 boxes for $1.25, at all dealers, or mailed direct on receipt of price by The T. Milburn Co. Limited, Toronto, Ont.

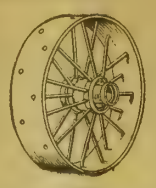
These Mighty Wheels are Tried and True.

Thousands of users testify to the superiority of T-K Wide-Tire Steel Wheels. They have four times the strength and durability of ordinary wheels—defy the worst roads, rocky, sandy, hilly or muddy, and lighten the draft on horses from 25 to to 50 per cent.



TK Wide Tire Steel Wheels and Handy Farm Wagons

Our wagons are designed especially to meet the demands of farmers for a wagon to do all kinds of work on the road and around the farm. They are built low for ease of loading and unloading, and will roll over the ground with the heaviest load without tiring the horses.

Write for descriptive catalog telling how T-K vehicles and wheels will earn more money for you.

MAIL CONTRACT.

SEALED Tenders addressed to the Postmaster General, will be received at Ottawa until noon, on Friday, the 11th August, 1911, for the conveyance of His Majesty's Mails, on a proposed Contract for four years, 3 times per week each way, between Sussex and Sussex from the Postmaster General's pleasure.

Printed notices containing further information as to conditions of proposed Contract may be seen and blank forms of Tender may be obtained at the Post Offices of Sussex and route offices and at the Office of the Post Office Inspector at St. John.

G. C. ANDERSON,
Superintendent.

POST OFFICE DEPARTMENT,
MAIL SERVICE BRANCH.
Ottawa, 24th June, 1911.

Teething children have more or less diarrhoea which can be controlled by giving Chamberlain's Colic, Cholera, and Diarrhoea Remedy. All that is necessary is to give the prescribed dose after each operation of the bowels more than natural and then castor oil to cleanse the system. It is safe and sure. Sold by all dealers.

There is very little definite data to show that color in the fruit is influenced by the nature of the fertilizers used. It is supposed by many that the use of potash and phosphoric acid will influence the color, and it is quite probable that they do, but I fancy that the influence of these may be very easily overshadowed by the effects of excessive quantities of nitrogen in the soil. It is quite possible, and even probable, that too late in the season there is apt to be so much leaf growth that the fruit is too much shaded, and the leaf and stem growth once strongly started is not easily checked, and as a result we have fruit lacking in color and often really lacking in maturity. It seems likely that if cultivation was stopped early in the season and cover crops sown, that better results would be got. The cover crop will use up a great part of the mositure and thus check the growth and cause ripening of the fruit says Prof. Harcourt, in the 'Canadian Horticulturist.'

If this be true, cultivation in the orchard cannot be stopped at any set time from year to year, or in one orchard as compared with another. The time to cease cultivation is dependent upon condition of the growth, which we hope will be influenced by the nature of the weather and the richness of the soil in plant food.

It is our intention this coming year to place a number of experiements which we hope to continue for a series of years. We wish to see what effect fertilizers will have on the fruits and also study the influence of fertilizers or other factors on the color of fruit. I shall be very glad to co-operate with anyone who wishes to take up this matter seriously, in order that we may get the experiment started on some really good basis. It is useless to start experiments on orchard fruits unless they are to be continued over a number of years, so that the full effects of the fertilizers on the trees and fruit can be definitely studied.—W. T. M.

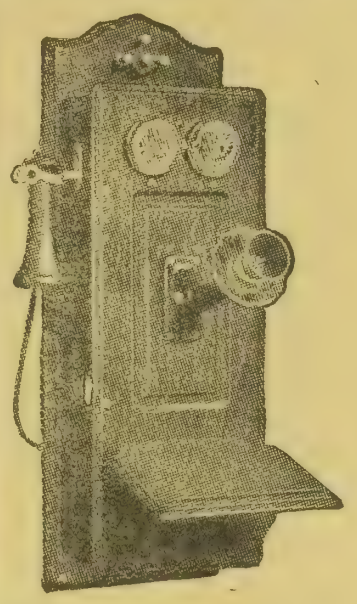
An Enemy Tiny but Formidable.

The flea beetle is small; in fact, so small that gardeners usually underrate its importance, and fail to put the full blame on it for the injury it causes. The perorations in the leaves of tiny things, like cucumbers, tomato plants, potatoes, etc., may be small, but they do harm. They increase the evaporation of moisture from the leaf surface and tissue. They weaken the vitality of the plant and reduce its power of resisting the attacks of diseases.

Potatoes, for instance, when infested with flea beetles, are particularly subject to tip-burn. Our only safety lies in fighting this tiny, but formidable, foe early and late. Tobacco-dust, scattered freely over the plants, will drive these beetles away. Of course, it does not kill them. Spraying with the old Bordeaux mixture also has a tendency to drive the beetles off the sprayed plants, and I believe that the diluted lime-sulphur solution will be equally effective in that direction. I make a surer job of it, however, by adding arsenate of lead in strong dose (one ounce per gallon) to the diluted solution. If you use the commercial lime-sulphur solution, make it weak enough to be safe for the plants you treat with it. When diluted one to forty or fifty of water, lime-sulphur appears to be safe to use on potatoes, egg-plants, peppers, cucumbers, muskmelons, squashes, pumpkins and most other vegetable plants. Apply as often as needed.

Order your telephone supplies from us.

Prompt shipments and guaranteed satisfaction



Post a Letter

to-night and ask for our No. 2 Bulletin (Rural Lines.) Also tell us to include our latest and most interesting publication, a handsomely illustrated book called "Canada and the Telephone."

At this season of the year, when new companies are constructing telephone lines and old systems extending their service, the demand for telephone supplies is heavy. But you can depend upon getting prompt service from us because we always carry a large stock of all materials necessary for the construction of a telephone line, and because we make a specialty of prompt shipping.

It will be to your advantage to get our prices on telephone supplies before placing your order. Our telephone materials are of first-class quality and fully guaranteed. On request we will send one or two telephones for a free comparison trial.

NO SUCH THING

As Saving Money Through Buying a Cheap Machine Instead of the Matchless

SHARPLES

Tubular Cream Separator

The cheap machine will more than lose the price of a Tubular the first year. Many thousand users of cheap separators are discarding them for Tubulars. The cheap machines lasted one year on the average—required ten to thirty dollars repairs—and lost more in cream than the original cost.

Do you call that "cheap"?

Tubulars have twice the skimming force, skim faster and twice as clean as others. Dairy Tubulars contain no disks or other contraptions. Wear a lifetime. Guaranteed forever by the oldest separator concern on this continent. The biggest economy you can make is to buy The World's Best.

Why spend money for some cheap machine? Separator quality is more important than first cost. Our local representative will show you the Tubular. If you don't know him, ask us his name.

Write for catalogue No. 194.

THE SHARPLES SEPARATOR CO.

DAIRYING.

Test Your Coward Cows.

Records of dairy cows are always of interest, not only to the owner who is anxious to increase the yield, but also to neighboring dairymen who desire some standard whereby to check the production of their cows. In April the yield of 10 cows near Birnam, Ont., was 383 pounds of butter fat; but from records to hand from the cow testing association near Bobcaygeon, Ont., it is seen that it took 21 cows, more than twice as many, to produce just as much butter fat.

In a year or two the men with these poor cows will probably have got his herd up to nearly double their presnt capacity because he will know for certain which cows are not worth keeping.

Dairy farmers in all provinces have done this, some are now getting nearly three times as much milk and fat as they used to obtain before they determined to gather information as to which poor cows were sheltering themselves, coward fashion behind either a fair herd average or a heavy yield from one or two extra good cows in the herd; such, for instance, as a seven-year-old grade cow near Woodstock, Ont., that gave last month 2,161 pounds of milk, testing 3.3 per cent of fat, thus giving over 73 pounds of butter fat in one month, almost double the good average yield above noted at Birnam.

Are your cows good profitable dairy cows, or are they cowards? It will pay you to keep records of each one and so find out.—C. W. F.

Protecting Cattle from Flies.

At this time of the year, says Prof. W. F. Handschin, of the Minnesota Agricultural College, must discomfort to cattle and loss to their owners is **cause by flies and other insects.** Feed becomes scarce at this season and this, combined with fighting flies and at times leaving such feed as there is to seek relief from the pest in the bush—or in water where this can be found—often results in a loss of weight in cattle.

In dairy herds, even where stables are darkened and the cattle kept in a part of the day, the loss in milk yields resulting from the annoyance caused by flies is often quite material.

Many different anti-fly mixtures and "dopes" have been used with more or less success. Several of those advertised have been used by the writer, and found fairly efficient in keeping flies off animals for from 3 to 12 hours, varying with the nature of the mixture and the amount applied. The mixtures are usually applied most satisfactorily by means of a small hand spray pump, which costs about a dollar. They can be thus applied in a very short time, and the only important item of expense is the mixture itself. Most of the patent mixtures cost from seventy-five cents to one dollar a gallon. Where considerable quantities are used the necessary ingredients can be purchased and the mixture made up at the cost of 30 to 50 cents per gallon.

One of the common mixtures is 3 parts of fish oil and I part kerosene. The fish oil contained in many of them costs about 45 cents a gallon in barrel lots, or 60 cents in ten-gallon lots.

Another good mixture is 100 parts fish oil, 50 parts oil of tar, 1 part crude carbolic acid.

Another, recommended by the Kansas Station, is: 1½ pounds resin, 2 cakes laundry soap, ½ part fish oil, ½ part kerosene. Mix thoroughly and add water to make 3 gallons.

Oil of tar—a very common ingredient and one that gives a pleasant odor and makes the mixture stick—can be bought for 20 cents a gallon in barrels and 30 cents in ten-gallon lots.

The Ayrshire Cow.

1. The Ayrshire is the most economical producer of milk and butter of any of the so-called dairy breeds, producing the largest quantity for the food consumed, and yielding the largest net profit. This has been proved in competitive public tests.

2. The Ayrshire produces the most desirable milk for the milkman of any of the dairy breeds, because of the uniform high quality in total solids, placing it above the standards required by State laws.

3. The Ayrshire milk is the most satisfactory to peddle because it will bear transportation without churning to butter, and will hold its uniform quality to the last quart in the can.

4. Ayrshire milk is the favorite with the housekeeper because it has a good color, and never looks blue, even to the last that is poured from the pitcher, the cream remaining in the milk to give it a uniform quality until the last is used.

5. Ayrshire milk is of the highest value for infant food, because it is most evenly balanced in the bone an muscle producing qualities of any of the dairy breeds thus making it a perfect food for growing children. Children fed on Ayrshire milk are not inclined to stomach trouble and make a strong and steady growth.

6. The Ayrshire has a strong, healthy body with a superabumdance of vitality and vigor, is rarely sick, and almost never has any disease of udder or teats, which is probably one reason why there is so much life giving quality in her milk.

7. The Ayrshire has never laid claim to being at the head of the dairy breeds for butter producing, but the official records made by the experiment stations during the past few years, would indicate that she is a most profitable butter cow, and second to none.

8. The Ayrshire is the dairy rustler of all the dairy breeds, thriving and paying a profit where other breeds can hardly exist, because she is a vigorous feeder, and not at all dainty in her appetite, eating with a relish, everything that comes in her way in the line of forage, good grass, poor grass and browse, all is food for the Ayrshire cow.

9. The Ayrshire cow is a most uniform milker, holding out well up to calving, and must be watched or she will not dry off, which makes her a desirable cow for steady profit, or for a family cow.

10. The Ayrshire cow is the most attractive looking cow, and the most perfect cow in form of body and udder of any of the dairy breeds. She breeds the truest type, and has the smallest percentage of poor cows of any of the dairy breeds.

11. The Ayrshire in the dairy will solve the problem of "How to make the dairy pay."—C. M., Winslow.

Buttermaking on the Farm.

If cream is rightly handled, the best butter can be made on the farm. Conditions can be controlled better there than in the creamery. In the creamery one can of bad cream will contaminate the whole lot from which butter is to be made. On the farm the cream can be given proper care from the time it is separated, for it is under the buttermaker's control.

The making of good butter begins with the milking of the cow; the

Cream Profits That Stay in Your Pocket

Empire Disc

THERE was a time when the first cost of a cream separator was a big factor in deciding which separator a cow owner should buy. But now it is different. Men have found it the best investment to pay a LITTLE MORE at the start rather than to be paying the difference constantly afterward in cream profits lost and in repairs necesary. Men have learn ed that in the

Frictionless Empire

Empire Line

Of Quality Separators

they can get not only the style and size separator they want, but also the one that nets the greatest returns for the money invested for the longest term of years—the one that makes profits that STAY in their pockets.

Seventeen Cents a Year was the average cost of repairs on all of the hundreds of thousands of Empire Cream separators in use last year. And the majority of these Empire machines have been in use for many years. It's the TIME test and repair cost that tell whether a separator is a paying investment.

Let us also PROVE that Empires turn easiest, are simplest, most sanitary, highest quality and most satisfactory. Write postal now.

We also handle Gasoline Engines and Rock Island Dry Batteries. Write us for prices first mail.

BUILT WITH CONCRETE BLOCKS

Made On

"IDEAL" FACE DOWN MACHINES

This beautiful home is at Britannia Heights, near Ottawa. It was constructed of Ideal Concrete Blocks.

With an Ideal Block Machine, you can make all the materials for your new home, right on the farm.

You can save money, and have a handsomer home, that will be fireproof and dampproof.

You can make all kinds of ornamental blocks, colored veneers, pillars, posts, etc.—just like the very expensive mansions in the big cities.

On one house, barn or silo, the Ideal Machine will pay for itself in the actual cost of building material—to say nothing in the saving of labor and hauling.

Let us send you illustrated booklets, which explain all about the Ideal Concrete Blocks and Machines. 12

Minard's Liniment Co., Limited.

Dear Sirs,—This fall I got thrown on a fence and hurt my chest very bad, so I could not work and it hurt me to breathe. I tried all kinds of Liniments and they did me no good.

One bottle of MINARD'S LINIMENT, warmed on flannels and applied on my breast, cured me completely.

C. H. COSSABOOM.

Rossway, Digby Co., N. S.

milking must not be done near a hog pen or where there are other undesirable odors, for milk will absorb flavors and odors quicker than any other substance. The udder of the cow should be wiped with a damp cloth before milking, for this will keep loose hairs and bacteria from falling into the pail. Do not wipe the udder with a dry hand for this will set free, hair and bacteria that will settle in the pail while milking. These bacteria and bad odors make the butter poor. By using a little care this source of danger can be avoided.

The cream from which butter is to be made must be properly ripened or scoured, before it is churned. During ripening the cream should be stirred several times to keep the fat and bacteria evenly distributed so uniform souring will follow. When the cream has a mild but distinctly sour taste and a glossy, brittle appearance it is then ready to churn.

In creameries, a starter is used for ripening but on the farm this is not practicable. In the summer the cream will ripen in one day and after ripening should be placed in cold water over night and churned the following morning at a temperature of about 50 degrees.

In winter, keep the cream in a warm place, or add some good sour milk to ripen it, if you wish to churn sooner. After ripening put the cream in a cool place and leave for three hours before churning so that a temperature of about 55 degrees will be reached before churning. It is better to have the churning temperature about five degrees higher in the winter than summer, because the particles of fat are more solid in winter and harder to collect.

The kitchen is not a good place to make butter, for it is too warm and the butter will absorb food flavor from meat, fruit and vegetables. If twenty or twenty-five pounds of butter are made a week it will pay to have a room fitted up for making butter. This room must be clean, well lighted and ventilated and have the entrance from the outside.

The chief difficulties in home butter-making come from improper churning temperatures, and more often the temperature is too high, rather than too low.

The way to correct this mistake is to get a floating dairy thermometer that is correctly graduated. This can be gotten for twenty-five cents from any creamery supply house. It should be placed in the cream. As soon as the cream has reached the proper temperature — 50 degrees —churning can begin. When the temperature is too high, the butter will come in soft lumps and have a greasy appearance and contain a good deal of buttermilk which causes it to keep very poorly and soon become strong. The time to stop churning can be told when the butter forms irregular shaped granules a little larger than wheat kernels, and floats at a good height in the buttermilk. If the butter is over-churned it will contain too much moisture and will not be so good for use.

The butter should be washed twice in pure water at the same temperature of the buttermilk, then salted at the rate of one ounce of salt to one pound of butter. Work the butter thoroughly to distribute the salt evenly.

It is of importance that the churn receives special care. After churning rinse the churn with lukewarm water, then scalding hot water; if the churn is rinsed with freshly slacked lime after washing it can be kept in good sweet condition. When ready for use again put in some warm water and the lime will readily come off and the churn will be in much better shape to receive the following churning.

The observance of a few rules and use of one's judgement are quite necessary in buttermaking.

Why does the Fat Vary?

The relation of fat to milk is one of the unsolved problems of dairying. We do not know why, absolutely, but we know that a cow will vary from day to day. It is sometimes due to fright and unkind handling. If you take a cow that is ordinarily quiet and run a needle into her, or hit her with a club or disturb her tranquility in some other way, the yield of milk will be very much less for that milking.

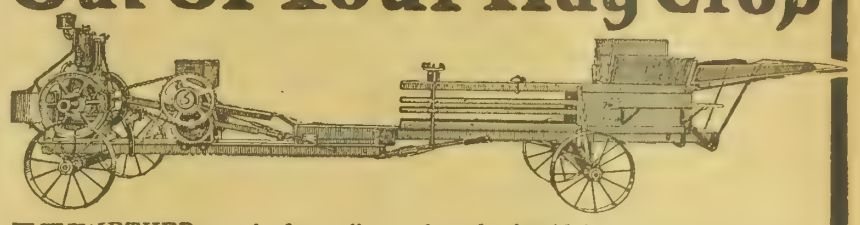
If she has what is called a nervous temperament, and is a very sensitive cow, there will be a very marked difference in the yield of milk, and fat will not be produced nearly so much.

In other words, the variation in the yield of milk is greater than the variation in the yield of fat. I remember the figures in one herd, in which one cow varied only four-tenths of one per cent. in a whole year, while another varied as much as three per cent. in her yield with no apparent cause.

Sometimes we ourselves do not feel so good as we do on other days. So of the cow. She may be a very sensitive cow, and the milker may be a little rougher on some days than on others and that may have some effect!

A multitude of influences are at wor. The best dairyman is the one who understands the largest number of them. The tester under ordinary conditions is to be relied on for accuracy. The variation is not a variation of the tester, but a variation in the cow.—Prof. H. F. Van Norman.

How To Get More Out Of Your Hay Crop



WHETHER you feed or sell your hay, it should be baled. Baled hay takes up much less room and nets a better price than loose hay. It is always ready for any market at top price, while loose hay must be sold near home, at whatever price you can get.

IHC Hay Presses

have many points of strength, simplicity, and convenience found in no other presses. They are equipped with a compound lever and a toggle joint plunger, which gives them their great compressing power. A 500 pound pull on the sweep of a 16x18 I H C press gives 76,800 pounds pressure in the bale chamber.

The bed reach is only about 4 inches high and very narrow. The bale chamber is very low—easy to reach over to tie the bale.

I H C Hay Presses are operated by horse power or gasoline engine. The one-horse press has 14x18-in. bale chamber; the two-horse press has 14x18-in., 16x18-in., or 17x22-in. bale chamber. The International Motor Baling Press is furnished with 14x18-in., 16x18-in., or 17x22-in. bale chamber and 3, 4, or 6-horse power I H C gasoline engine.

If you examine an I H C hay ress you will appreciate its value as a money saver and money maker.

Call on the I H C local agent for catalogue and full particulars, or, if you prefer, write nearest branch house.

Some Indications of Good Milking Capacity.

While no intelligent man will unreservedly risk his reputation by saying whether or not a certain cow is a good milker before being tested, there are certain indications by means of which milking capacity is shown. And upon this ability to produce milk depends the value of a milch cow, no matter how well bred she may be or how closely she resembles the dairy type or form.

Never pick on a good looking cow for a milker, at least not good looking from the beef producer's standpoint. The rotund form with graceful curves is not compatible with large milk production. Angularity is an indication that the animal's energies are utilized for some purposes other than the laying on of flesh, and if the other dairy characteristics are present it may be taken as a valuable guide. Sometimes, however, angularity is a result of the animal being in an advanced stage of tuberculosis or chronic indigestion or just simply a tendency to always be a scrub and a poor feeder, bred in the animal and impossible of elimination by whatever feed or management. This latter kind of angularity can be distinguished from the other easily enough, and, of course, is not wanted.

The milking capacity of a cow, so scientists say, is dependent upon the number of gland-lobules in the udder. A cow must have a large flexible udder in order to have a large number of these gland-lobules, although the number of lobules can only be approximately estimated. These elaborate the milk from the blood on its course through the udder. Now the amount of blood which enters the udder is most important as regards the quantity of milk produced and this amount can be approximately estimated by the size of the blood vessels. These vessels enter the udder near the hips leading directly from the heart, pass through the udder, supplying the lobules, and emerge on the surface running along the underside of the belly to a point about half way from flank to the girth, where they disappear and enter the thoracic cavity. A round hole, where these vessels enter the abdominal wall, may be felt with the finger, and it is thought that the larger these holes, the better the milker, because of the larger quantities of blood passing through the udder and up through these milk wells. Large irregular veins on the outside of the udder and leading up to the walls are preferred to straight ones. This blood system is to supply the gland-lobules, and the number of lobules is dependent upon the breeding of the cow. Feed will not make more lobules. The only way they may be secured is by proper breeding and selection. The good milkers will have them, and whether they are called by that name or no matters little so long as you have the cow that gives the milk.

The above outward characteristics are only indicators, but they may help someone in selecting a cow. The final test is the pail, tester and scales, but they cannot be used in buying from a herd or at a public sale. A cow without the characteristics mentioned will be of little use in the dairy, but not all cows possessing them are necessarily record breakers.

LIVE STOCK

Scours in Calves.

A calf that has come from a well fed dam, has been born on grass or in a clean stable, has been given sunshiny and clean quarters and has been allowed to suck his dam or has been given a moderate amount of clean, sweet, warm milk, should not be affected with scours. If any of the above factors are lacking, scours are likely to follow. Scours is one of the greatest enemies of the skim-milk calf feeder, causing probably more deaths than any other calf ailment. As a first step in curing scours, separate the sick calf from the well ones.

Put him in a clean, airy, sunshiny place, and cut down his milk supply. If he is being fed skim-milk, be sure that it is of the very best quality, and that it is given warm and clean in scaled vessels. For a severe case of scouring, give two to six tablespoonfuls of castor oil (the amount depends upon the size of the calf) in scalded milk. Mix two parts of subnitrate of bismuth with one part of salol and give one or two teaspoons of the mixture in a little milk twice daily. Of the home remedies one or two raw eggs or a teaspoonful of strong coffee are most valuable.

For mild cases the simplest remedy is to place a teaspoonful of dried blood in the milk at each meal time. For very severe cases, it is recommended that the dried blood treatment be modified, giving in the morning one or two ounces of castor oil and following in about 12 hours with fifteen to twenty-five drops of laudanum, a teaspoonful of dried blood and one or two raw eggs. Another treatment which has been found effective in preventing and curing scours is the formalin method. One-half ounce of formalin is mixed with 15.5 ounces of clean rain water and one teaspoonful of the mixture is given with each pint of milk.

The Mutton Lamb.

The mutton lamb is the general term used to designate the immature sheep that comes to the slaughter in its youth. There are all sorts of mutton lambs in age, from the comparatively young, sucking lamb of three or four months, to the lamb practically a year old, and hay and grain fed in the feed lot from four to five months. The mutton lamb industry of the east is mainly the early winter lamb raised on its mother and crowded above this with all the nice ground feed it cam be coaxed to eat. This lamb grows very best, gets very fat and by the time it is 90 to 120 days old is one of the finest samples of mutton lamb that it is possible to secure.

The older lamb is the common range lamb, usually grown up with the pastured flock with no extra care, weaned at four to five months of age, then put into the feed lot and started on grain, ground feed and hay, and as quickly as possible crowded to the limit of its ability to consume for four to five months, then put onto the market. The former is usually of mutton bred ancestors, at least the sire is generally a mutton ram, and this gives the lamb size and ability from the start to make the most of its opportunity. It is also quite important in this calss of mutton lambs to have a good grade of mutton ewes, as their milking qualities exceeed the fine wooled ewe, and a liberal milker is the key to success in making the winter mutton lamb.

It is a nice business to raise fifty or a hundred of these February or March lambs and crowd them just as fast as they will take the feed. Good stables, so as to keep them comfortable during cold weather, and plenty of pasture to turn the flock onto every day, that it is comfortable to be out in the sun. Plenty of good feed, all the variety possible to make the ewes liberal in milk flow, grains, ground feeds, roots crops, alfalfa hay and every attention and advantage possible.

Running Pigs on Clover.

It has always been our opinion that the cheapest pork can be produced on clover pasture, when it is used in conjunction with some supplemental feed. Clover furnishes cheap protein, allows the hog to exist in what approaches his natural condition, keeps him fairly healthy, manures your field and saves a great deal of labor.

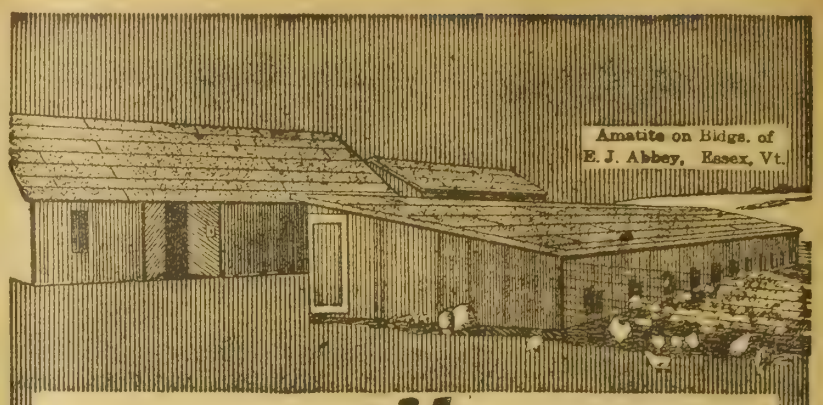
We have found that most of our profitable litters are those that are farrowed about the time the sows can be turned on pasture. It is an easy matter to take a roll of hog fencing, stick in a post every seven or eight rods and to stretch up your fence. It can be done in half a day. Several litters of pigs can be run in a few acres.

After suckling a few weeks the sows can be reduced to a fraction of a few ears of corn a day. Before this a few troughs can be placed so as to admit the pigs and keep out the sows, when the pigs can be given shorts and other feeds.

Handled in such a manner you have fair size shoats when the new root crop is ready to be fed. Then, a little green corn can be used to advantage. However, by the time the roots are ready the shoats will stand quite a heavy feeding while on the clover. By so doing, the spring pigs can often be turned off after running behind steers on a very short feed, which begins early in the fall. Two years ago we turned a bunch of shoats so raised in a cornfield with the older hogs. When the piece was hogged off part of the spring hogs went to market

As a further proof of the profit in clover as a hog feed I will mention our experience of last summer. When the clover pasture was ready we turned in 175 pigs, averaging ninety-seven pounds apiece. They had the run of fifteen acres of clover and a small amount of wood pasture.

Throughout the summer they received a gradually increasing amount of ear corn. When the new crop was fit we fed green corn until the other



Amatite ROOFING
Needs No Painting

TRADE B MARK

AMATITE *roofing is weaned.* It doesn't need to be watched over and fussed with and cared for.

It takes care of itself from the start. As soon as it is laid on your roof, you can go away and forget about it.

You *don't have to paint* Amatite every two years as you do the "rubber" kinds. Amatite has a mineral surface which needs no painting.
